

Experimental Section⁴

Citronellyl Thiocyanate (I).—Citronellyl bromide (9 g, 0.041 mole) was added during 0.5 hr, with stirring at room temperature, to a solution of NaSCN (3.33 g, 0.041 mole) in anhydrous EtOH (50 ml). The mixture was then refluxed for 3 hr, cooled, filtered, and evaporated. The residue was taken up in Et₂O to remove the salts. Evaporation of the Et₂O solution gave an oil which was distilled *in vacuo* under N₂ to yield 3.6 g of I as a colorless oil: ν_{\max} 2158 cm⁻¹ (SC≡N, sharp); pmr, δ 0.96 (doublet, \geq CCH₃), 1.61 (singlet, CCH₃=CH(CH₂)₂-*trans* CH₃), 1.68 (singlet, CCH₃=CH(CH₂)₂-*cis* CH₃), 2.95 (triplet, α -CH₂), and 5.06 (triplet, -CH=).

Citronellyl Isothiocyanate (II).—Citronellylamine (9.31 g, 0.06 mole) was added dropwise during 0.5 hr, with stirring at 10–15°, to CS₂ (4.56 g, 0.06 mole) and NaOH (2.4 g, 0.06 mole) in H₂O (25 ml). After refluxing for 2 hr and cooling to 35–40°, ClCOOC₂H₅ (6.51 g, 0.06 mole) was dropped into the mixture during 1 hr, taking care that the temperature did not exceed internal 40°. After an additional 0.5 hr of stirring, the separated oil was extracted (Et₂O), and the extract was washed (4% NaHCO₃, H₂O), dried (Na₂SO₄), and evaporated. The residue was distilled at 87–92° (0.5 mm) to yield 5.28 g of II as a colorless oil: ν_{\max} 2121 cm⁻¹ (N=C=S, broad); pmr, δ 0.96 (doublet, \geq CCH₃), 1.61 (singlet, CCH₃=CH(CH₂)₂-*trans* CH₃), 1.68 (singlet, CCH₃=CH(CH₂)₂-*cis* CH₃), 3.55 (triplet, α -CH₂), and 5.06 (triplet, -CH=).

Geranyl isothiocyanate (IV) was prepared as was II; ν_{\max} 2101 cm⁻¹ (N=C=S, broad); pmr, δ 1.61 (singlet, CCH₃=CH(CH₂)₂-*trans* CH₃), 1.69 (singlet, CCH₃=CH(CH₂)₂-*cis* CH₃) and CCH₃=CHCH₂NCS CH₃, 4.06 (doublet, α -CH₂), 5.06

(4) Boiling points are uncorrected. The *R_f* values were determined on glass chromatostrips coated with silica gel (GF₂₅₄ Merck; the tlc was performed with cyclohexane-ethyl acetate (95:5). The spots were detected with a 1% solution of vanillin in concentrated H₂SO₄. Ir spectra were recorded between rock salt plates with a Perkin-Elmer grating spectrophotometer Model 337. Pmr spectra were taken with a Varian spectrometer Model A-60 A operating at 60.00 Mc, in a radiofrequency range of 0.02–0.04 mG (sample temperature, 36°). The reference zero standard was internal Me₄Si and the chemical shifts are given in parts per million downfield from this point (δ scale).

(triplet, CCH₃=CH(CH₂)₂ olefinic proton), and 5.37 (triplet, CCH₃=CHCH₂NCS olefinic proton).

Farnesyl isothiocyanate (VI) was prepared as was II; ν_{\max} 2101 cm⁻¹ (N=C=S, broad); pmr, δ 1.60 (singlet, CCH₃=CH(CH₂)₂-*trans* CH₃), 1.68 (singlet, CCH₃=CH(CH₂)₂-*cis* CH₃) and CCH₃=CHCH₂NCS CH₃, 4.06 (doublet, α -CH₂), 5.06 (triplet, CCH₃=CH(CH₂)₂ olefinic protons), and 5.37 (triplet, CCH₃=CHCH₂NCS olefinic proton).

Linalyl Isothiocyanate and Geranyl Thiocyanate (III).—Geranyl bromide (10.85 g, 0.05 mole) was added dropwise during 15 min, with stirring at 0°, to a solution of NaSCN (4.05 g, 0.05 mole) in anhydrous EtOH (50 ml). After an additional 0.5 hr of stirring at room temperature, the suspension was filtered and the solution was evaporated. The residue was taken up in Et₂O, washed (H₂O), dried (Na₂SO₄), and evaporated. The new residue was distilled at 68–73° (0.15 mm) to yield 5.55 g of a colorless oil (III), which consisted (by pmr) of linalyl isothiocyanate (80.56%) and geranyl thiocyanate (19.44%): ν_{\max} 2090 (N=C=S and SC≡N, broad) and 984 and 925 cm⁻¹ (vinyl =CH bonds); pmr, δ 1.47 (singlet, \geq CCH₃), 1.61 (singlet, CCH₃=CH(CH₂)₂-*trans* CH₃), 1.68 (singlet, CCH₃=CH(CH₂)₂-*cis* CH₃) and CCH₃=CHCH₂SCN CH₃, 3.62 (doublet, α -CH₂), 5.06 (triplet, CCH₃=CH(CH₂)₂ olefinic protons), and 5.39 (triplet, CCH₃=CHCH₂SCN olefinic proton).

Nerolidyl Isothiocyanate and Farnesyl Thiocyanate (V).—Reaction of farnesyl bromide with NaSCN, carried out as was described for III, yielded a colorless oil (V), which consisted (by pmr) of nerolidyl isothiocyanate (83.34%) and farnesyl thiocyanate (16.66%): ν_{\max} 2084 (N=C=S and SC≡N, broad) and 984 and 925 cm⁻¹ (vinyl =CH bonds); pmr, δ 1.48 (singlet, \geq CCH₃), 1.60 (singlet, CCH₃=CH(CH₂)₂-*trans* CH₃), 1.68 (singlet, CCH₃=CH(CH₂)₂-*cis* CH₃) and CCH₃=CHCH₂SCN CH₃, 3.62 (doublet, α -CH₂), 5.06 (triplet, CCH₃=CH(CH₂)₂ olefinic protons), and 5.39 (triplet, CCH₃=CHCH₂SCN olefinic proton).

Acknowledgments.—The authors thank Mr. O. Boniardi for his assistance in preparing the compounds and Dr. R. Perego for the microanalyses.

New Compounds

The Synthesis of Certain

3,5-Dimethyl-N¹-arylsulfonylpyrazoles and 3-Methyl-N¹-arylsulfonyl-5-pyrazolones

CARLOS SUNKEL AND MARIANA SÁNCHEZ

Department of Organic Chemistry, Institute of Research, Universidad Católica de Valparaíso, Valparaíso, Chile

Received February 14, 1969

Pyrazole and 5-pyrazolone derivatives present a variety of pharmacological applications, especially the hypoglycemic activity of several pyrazoles^{1–3} and the antidiuretic effects of 5-pyrazolones.^{4,5} We now report the preparation of certain 3,5-dimethyl-N¹-arylsulfonylpyrazoles (I) (Table I) and 3-methyl-N¹-arylsulfonyl-5-

pyrazolones (III) (Table III) from the corresponding 1-arylsulfonylhydrazides.⁶

50 ml of 95% EtOH, 0.004 mole of acetylacetone was added. The solution was refluxed 1–2 hr, then left overnight at 3°. Recrystallization from MeOH gave white crystals.

Method B.—Equimolar quantities of acetylacetone and the 1-arylsulfonylhydrazide (0.002 mole), were dissolved in 30 ml of DMF at 0°, and 3 drops of 2 *N* HCl were added. The solution was stirred at room temperature for 2 hr, then left at 3° overnight. The transparent white crystals thus obtained were recrystallized from 1:1 Et₂O–petroleum ether (40–60°).

1-Arylsulfonylhydrazones of Ethyl Acetoacetate (II) (Table II).
Method C.—To a solution of 0.002 mole of the 1-arylsulfonylhydrazide in 50 ml of 95% EtOH, was added 0.004 mole of ethyl acetoacetate. The solution was refluxed 1–2 hr, then left overnight at 3°. The white crystals were filtered and recrystallized from EtOH.

Method D.—Equimolar quantities (0.002 mole) of ethyl acetoacetate and the 1-arylsulfonylhydrazide were dissolved in 50 ml of 95% EtOH, and 2 ml of 5% AcOH was added. The solution was stirred at room temperature for 2 hr, then left overnight at 3°. The white crystals were filtered and recrystallized from 1:1 MeOH–H₂O.

3-Methyl-N¹-arylsulfonyl-5-pyrazolones (III) (Table III).—The 1-arylsulfonylhydrazone of ethyl acetoacetate (0.002 mole) was dissolved in 10 ml of 5% Na₂CO₃ and held at 80–90° for 2–3 hr. It was then cooled and brought to pH 3 with 0.6 *N* HCl, then left overnight at 3°. The white powder obtained was recrystallized from H₂O.

Acknowledgment.—We thank Dr. Juan Estaven of the University of Barcelona for the elemental analyses and also the Diamond Shamrock Corp. for generous supplies of several reagents.

Preparation of (Carboxymethyl)cyclohexyldimethylammonium Chloride Hydrazide

T. A. MCGUIRE AND C. L. MEHLTRETTER

Northern Regional Research Laboratory,
Agricultural Research Service, U. S. Department of Agriculture,
Peoria, Illinois 61604

Received March 13, 1969

In studies of the reaction of cationic hydrazides with carbonyl groups in periodate-oxidized starches^{1,2} we

synthesized (carboxymethyl)cyclohexyldimethylammonium chloride hydrazide by the method of Girard and Sandulesco³ for Girard T reagent. The new compound might be of value in isolating ketones from steroid mixtures³ and aldehydes from autoxidized fats and oils.⁴

Experimental Section

(Carboxymethyl)cyclohexyldimethylammonium Chloride Hydrazide.—*N,N*-Dimethylcyclohexylamine⁵ (53.4 g, 0.42 mole) was added dropwise to a stirred solution of ethyl chloroacetate (49.0 g, 0.40 mole) in 100 ml of absolute EtOH at 5°. The mixture was stirred at 5–10° for 30 min, then heated at 60–70° for 1 hr, and allowed to stand at room temperature overnight to form the intermediate ethyl ester of (carboxymethyl)cyclohexyldimethylammonium chloride in solution.

Hydrazine of 95+ % purity (13.5 g, 0.40 mole) was added dropwise to this solution during 15 min of continuous stirring with the temperature rising to 50–60°. The reaction mixture was maintained at this temperature range for 1 hr and then concentrated *in vacuo* to about 100 ml. When an equal volume of EtOAc was added to the concentrate and it was kept at 2° for 36 hr, crystallization occurred. The extremely hygroscopic product was filtered off in an atmosphere of 11% relative humidity and dried *in vacuo* over P₂O₅. Recrystallization from EtOAc–EtOH (5:1) gave 57.6 g (61%) of the hydrazide, mp 160–164°. *Anal.* (C₁₀H₂₂ClN₃O) C, H, N, Cl.

Acknowledgments.—We thank Mrs. Clara McGrew and Mrs. Bonita Heaton for the microanalyses.

3,3-Disubstituted Ethyl Carbazates¹

WALTER T. SMITH, JR., AND WEN-YEAN CHEN

Department of Chemistry, University of Kentucky,
Lexington, Kentucky 40506

Received February 17, 1969

The antitumor activity of such hydrazine derivatives as MIH [CH₃NHNHCH₂C₆H₄CONHCH(CH₃)₂], 1-acetyl-2-picolinoylhydrazide, and 5-(3,3-dimethyl-1-triazeno)-4-imidazolecarboxamide, has encouraged us to prepare some 3,3-disubstituted ethyl carbazates for screening.

The lack of significant activity (Table I) in those compounds (1–4) which are not alkylating agents would seem to indicate that the activity of 5 is related to its alkylating properties rather than to any properties it may have as a substituted hydrazine.

Experimental Section²

Ethyl 3,3-Bis(chloroallyl)carbazates.—Compounds 1–4 were prepared from the appropriate dichloroalkene (0.5 mole), ethyl carbazate³ (0.25 mole), and NaOH (0.5 mole) in absolute EtOH (50 ml). The mixture was shaken with cooling for 1 hr, followed by shaking for an additional 8 hr, then filtered. The filtrate was
