## Antiinflammatory Agents. 4.<sup>1</sup> Syntheses and Biological Evaluation of Potential Prodrugs of 2-Amino-3-benzoylbenzeneacetic Acid and 2-Amino-3-(4-chlorobenzoyl)benzeneacetic Acid

David A. Walsh,<sup>\*,†</sup> H. Wayne Moran,<sup>†</sup> Dwight A. Shamblee,<sup>†</sup> William J. Welstead, Jr.,<sup>†</sup> Joseph C. Nolan,<sup>†</sup> Lawrence F. Sancilio,<sup>‡</sup> and Gustav Graff<sup>§</sup>

Departments of Chemical Research, Pharmacology, and Molecular Biology, A. H. Robins Company, P.O. Box 26609, Richmond, Virginia 23261-6609. Received November 20, 1989

A series of potential prodrugs of 2-amino-3-benzoylbenzeneacetic acid (amfenac) and 2-amino-3-(4-chlorobenzoyl)benzeneacetic acid were synthesized and evaluated for their cyclooxygenase inhibiting properties, antiinflammatory potency, and gastrointestinal irritation liability. One compound, 2-amino-3-(4-chlorobenzoyl)benzeneacetamide, possessed a therapeutic index 1 order of magnitude greater than that of indomethacin.

In general one of the most prevalent and serious side effects of the use of nonsteroidal antiinflammatory drugs (NSAIDs) is the occurrence of gastrointestinal damage.<sup>2</sup> Gastric upset and irritation are a major stumbling block to patient compliance with a prescribed dosage regimen. There have been several attempts to improve the gastric tolerance of NSAIDs which have met with varying degrees of success such as formulation (e.g., buffered, sustained-release, or enteric-coated), chemical manipulation such as esterification<sup>3,4</sup> and coadministration of agents in an attempt to protect the stomach.<sup>5</sup>

As part of a continuing effort to prepare NSAIDs with minimal or no gastrointestinal side effects, several compounds (Charts I-IV) were synthesized which may be metabolically converted to 2-amino-3-benzoylbenzeneacetic acid (1, amfenac),<sup>6</sup> a potent cyclooxygenase inhibitor and clinically useful antiinflammatory drug,<sup>7</sup> or its 4-chloro derivative 2.<sup>1</sup> Ideally these precursors should have no inherent cyclooxygenase inhibiting activity so that when orally administered there would be no gastric side effects before absorption. They would then be metabolically converted to active species 1 or 2 and undergo enterohepatic recirculation<sup>8</sup> to exert the desired antiinflammatory effect. The approach used was to chemically modify 1 and 2 to provide compounds which could be broken down in vivo enzymatically or by non-enzymatic processes to release the active moiety. The term "drug latention" was used by Harper<sup>9</sup> to describe this approach.

The synthesized compounds are arbitrarily classified into four categories: compounds which may be converted to 1 or 2 by (a) hydrolysis (Chart I), (b) an oxidative process (Chart II), (c) a reductive process (Chart III), and (d) a multistep process (Chart IV). Since 1 and 2 are potent cyclooxygenase inhibitors,<sup>1</sup> it was assumed that a prodrug that did not possess cyclooxygenase inhibiting properties was inherently devoid of antiinflammatory activity, and any in vivo activity could be ascribed to a metabolic conversion to a cyclooxygenase inhibitor. The compounds initially were tested in vivo in the Evans blue-carrageenan-induced pleural effusion assay,<sup>10</sup> a model

Chart I. Compounds That May Be Converted to 1 or 2 by Hydrolysis

of acute inflammation (Table I), and then tested in vitro for cyclooxygenase inhibiting properties (Table II).

were then compared to indomethacin in the adjuvant-induced arthritic rat model,<sup>6</sup> a model of chronic inflammation, and in a chronic rat intestinal toxicity model.<sup>1</sup> A therapeutic index, the ratio of the potency (versus indomethacin) in the adjuvant-induced arthritis assay divided by the potency (versus indomethacin) in the intestinal toxicity assay, was determined to assess any relative improvement in the irritation profile of the prodrugs when compared to 1 or 2 (Table II).

Whenever prodrugs are assessed in animal models there are at least two caveats that should be considered. One is that the results from tests conducted in rats may not be directly transferable to the human situation, since it is well-known that species to species variations in absorption, distribution, and metabolism exist. In addition, the possibility exists that in the conversion of prodrugs to active drugs, reactive chemical intermediates could be released into the biological system and a toxic response could be elicited.<sup>11</sup> In the final analysis only toxicological and human clinical studies will answer these questions.

### Chemistry

Compounds 5-8 and 16 were synthesized by using Gassman's procedure,<sup>12</sup> or a modification, for the prepa-

ration of oxindoles (Scheme I). An appropriately substituted aniline was reacted with a substituted thiol derivative in the presence of *tert*-butyl hypochlorite at low temperature to give an azasulfonium salt. The azasulfonium salt was treated with triethylamine to cause ylide formation and a Sommelet-Hauser-type rearrangement to yield the 2,6-disubstituted aniline derivatives 31–34 in a one-pot sequence. When ethyl methylthioacetate was used, the resulting intermediate was relatively unstable and readily cyclized in the presence of acid to the oxindole (35). Gassman reported that if methylthioacetamide was used as a sulfide, the stable intermediate (such as 31) could be isolated. It was observed that (methylthio)acetonitrile could also be used as the sulfide to generate stable intermediates (33, 34). (Methylthio)acetamide is relatively insoluble in methylene chloride at -70 °C and yields were variable when this reagent was used. Improved yields could be obtained if the methyl substituent on the sulfur was replaced with a more lipophilic alkyl or aryl group. (Phenylthio)acetamide gave a good yield of 32, and in other examples,<sup>13</sup> 2-(2-propylthio)acetamide was the reagent of choice. Raney nickel desulfurization of 31–34 gave 5–8, respectively. Removal of the methylthio group from 34 to give 36 was accomplished with tin and HCl. Base hydrolysis of 36 gave 16.

Scheme II shows several compounds derived from 1 or 2 by various reductive processes. Catalytic hydrogenation of 1 with 10% palladium on carbon can result in production of 13 or 15 depending on temperature and length of reaction. Since a chloro substituent can be removed by catalytic hydrogenolysis, 2 was reduced with NaBH<sub>4</sub> to give 14. Reduction of esters 3 and 4 with LiAlH<sub>4</sub> gave the diols 20 and 21, respectively. Reaction of 20 and 21 with activated MnO<sub>2</sub> resulted in selective oxidation of the benzylic

<sup>a</sup>All compounds were analyzed for C, H, and N and results agreed to  $\pm 0.4\%$  of theoretical values. <sup>b</sup>m = water, n = absolute ethanol, o = 2-propanol, p = acetonitrile, q = toluene, r = petroleum ether (30-60 °C), s = ethyl acetate, t = isopropyl ether, u = hexane, v = ethyl ether, w = benzene. <sup>c</sup>Numbers refer to references where a preparation is reported and letters refer to procedures described in the Experimental Section. <sup>d</sup>Indomethacin. <sup>e</sup>Not significantly different from control group at  $p < 0.05$ , as determined by the Dunnett's  $t$  test. <sup>f</sup>Inactive at 316 mg/kg. <sup>g</sup>Phenylbutazone at 100 mg/kg was used as reference standard.

Scheme III. The desired 2-nitro derivatives<sup>16</sup> 23, 24 were prepared by a synthetic route previously described<sup>17</sup> for the 5-nitro isomer. The required 3-chloro-2-nitrobenzophenones 37, 38 were obtained by the oxidation of the 3-chloro-2-aminobenzophenone derivatives with use of peroxytrifluoroacetic acid.<sup>18,19</sup> The activated chloro group

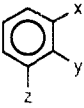

was then displaced with diethyl malonate anion, and adducts 39 and 40 were hydrolyzed and decarboxylated with acid.

The oxidation of 2-aminobenzophenone derivatives with peroxyacetic acid stopped at the 3-aryl-2,1-benzisoxazole (41, 42) stage<sup>19</sup> in contrast to the more drastic conditions of peroxytrifluoroacetic acid which oxidized to the nitro derivatives 37, 38. Bromination of the methyl substituents (43, 44), displacement of the bromo substituents with cyanide anion (45, 46), and base hydrolysis of the nitriles gave the desired 2,1-benzisoxazoleacetic acids 25, 26.<sup>20</sup>

<sup>a</sup>Therapeutic index = potency in adjuvant-induced arthritis assay/potency in intestinal toxicity assay. <sup>b</sup>Indomethacin. <sup>c</sup>95% confidence limits do not overlap 1.0; thus the compound is significantly different than indomethacin. <sup>d</sup>Approximation; regression lines are not parallel.

The reaction of 2-amino-3-ethylbenzophenone<sup>15</sup> with benzyltriethylammonium permanganate<sup>21</sup> gave oxidation at the benzylic position and yielded the diketone 27.

Scheme IV outlines the synthesis of substituted  $\gamma$ -oxo-benzenebutanoic acids 28, 29<sup>22</sup> from 7-benzoylindole derivatives. A Mannich-type reaction with a substituted 7-benzoylindole gave the 3-(dimethylamino)methyl adducts 47, 48. The dimethylamino group could be displaced with the diethyl malonate anion to yield 49 and 50. Base hydrolysis (51, 52) followed by decarboxylation induced by heat led to the substituted indole-3-propanoic acids 53, 54. When 53 was subjected to ozonolysis, 28 was isolated directly from the reaction mixture. Under similar reaction conditions, the chloro-substituted derivative 54 gave the intermediate ester 55. Base hydrolysis of 55 resulted in the desired 29.

## Results and Discussion

The goal of this research project was to determine if a prodrug of 1 or 2 could be found that had a high therapeutic index, yet had a rapid onset of action. Candidates 3–30 were tested in the pleural effusion rate assay, an acute model of inflammation (Table I). Activity in this model indicated that the compound possessed inherent anti-inflammatory activity or was rapidly metabolized to an active

Scheme IV<sup>a</sup>

<sup>a</sup>(a) CH<sub>3</sub>CO<sub>2</sub>H, H<sub>2</sub>O, C<sub>2</sub>H<sub>5</sub>OH, (CH<sub>3</sub>)<sub>2</sub>NH, CH<sub>2</sub>O, 100 °C, 0.5 h; (b) xylene, NaH, CH<sub>2</sub>(CO<sub>2</sub>C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>,  $\Delta$ , 17 h; (c) 3 N NaOH,  $\Delta$ , 18 h; (d) 190–200 °C, vacuum; (e) 1. species. Most of the compounds tested showed activity in this model. Of the group of compounds (2–12) which could be hydrolyzed to 1 or 2, only the nitriles (7, 8) and the oxindoles (11, 12) were inactive. When amides 9 and 10 were compared, the more labile trifluoroacetyl-substituted amide 12 was active while the acetyl-substituted amide 11 was inactive. Of the group of compounds (13–21) which must be oxidized to give 1 or 2, only 15 and 17 were inactive at 100 mg/kg. Metabolic reduction of 22–26 could give 1 or 2 but only 22 was inactive. Compounds 27–30 require a multistep chemical conversion to 1 or 2 and should be the least likely group to have a quick onset of

action. However only 27 was inactive while 28–30 showed good activity at 100 mg/kg.

Compounds which were active at 100 mg/kg in the pleural effusion assay were then tested as cyclooxygenase inhibitors (Table II). If a compound had no activity against cyclooxygenase at the dose tested it was considered to have no inherent antiinflammatory activity and to be a true prodrug. Only three compounds (3, 4, 16) which possessed *in vivo* activity in the pleural effusion assay showed any activity against cyclooxygenase. It is difficult to assess whether esters 3 and 4 are inherently active, or whether a small amount of hydrolysis occurs and the acids 1 and 2 are liberated in the testing medium.

In order to assess whether a therapeutic advantage was achieved through use of the prodrug, each compound was tested in the adjuvant-induced arthritis rate assay, a chronic model of inflammation, and a potency determined versus indomethacin. Compounds which possessed good activity in the chronic inflammation model were tested for intestinal toxicity in a rat intestinal lesion assay, and a potency compared to indomethacin was determined. A chronic therapeutic index was calculated (Table II), and this number was used to select candidates for further study.

Eleven (3, 4, 6, 10, 19, 23–26, 28, 29) compounds showed good activity (potency  $>0.1 \times$  indomethacin) in the adjuvant-induced arthritis assay. All 11 compounds were equivalent to or less than indomethacin in their ability to induce intestinal lesions. It is interesting to note that of the compounds 13–21 which were required to be oxidized to be converted to 1 or 2, only 19 showed good activity in the chronic inflammatory assay. All the prodrugs (except 3) tested had a better index than indomethacin. Clearly 6 stood out from the other candidates by virtue of the value of 10 for its therapeutic index, an order of magnitude improvement over indomethacin. Compound 6 has undergone extensive pharmacological evaluation, the results of which will be reported in a separate communication.

The data in Table II point out that it is difficult to draw generalizations concerning which chemical modifications will produce a prodrug with a high therapeutic index. When amides 5 and 6 are compared, it is observed that the chloro-substituted 6 retains good activity in the adjuvant-induced arthritis assay while 5 is weakly active. A similar observation can be made for alcohols 18 and 19. In all cases studied, chloro-substituted compounds had greater *in vivo* activity (albeit small in some cases) than their unsubstituted counterparts. The relationship between systematic changes in chemical substituents and the resulting biological variation has been the backbone of much of the study in medicinal chemistry. However when the combination of absorption, distribution, and metabolism must be considered to determine the efficacy and safety of a prodrug, each compound must be considered as unique, and structure–activity generalizations are to date extremely difficult to assess.

## Experimental Section

**A. Antiinflammation.** 1. Acute antiinflammatory activity was determined in the Evans blue–carrageenan-induced pleural effusion model by a modification of the method of Sancilio and Fishman.<sup>10</sup> Each compound was administered orally at doses of 100 and 4.0 mg/kg to six fasted rats, and the 5-h effusive response to the intrapleural injection of 5 mL of 0.075% Evans blue–0.5% carrageenan type 7 at 37 °C was measured. Indomethacin at 4.0 mg/kg orally was used for comparison. The data were reported as a percentage decrease in the average volume of pleural fluid from that of the control group. Statistical differences between control and various treated groups were determined by the Dunnett's *t* test.<sup>25</sup>

2. Chronic antiinflammatory activity was determined in the adjuvant-induced arthritic rat model of Walz et al.<sup>26</sup> with use of a therapeutic rather than a prophylactic dosing regimen as described by Sancilio et al.<sup>6</sup> Female Lewis Wistar rats that weighed between 151 and 236 g were used. On day 0 a tattoo was made on each leg at the point where the Achilles tendon enters the gastronemius muscle. This served as a reference point for measuring the limb volume plethysmographically. Several hours later 0.05 mL of a suspension of 1.5% *Mycobacterium butyricum* in mineral oil was injected into the subplantar surface of the right hind paw. On day 18 the hind limb volumes of both paws were determined. Animals with significant swelling of the uninjected paws were randomized by block design into groups of 7 or 8. They were dosed orally (po) 5 days/week starting on day 18 with the last dose being given on day 28. Twenty-four hours after the last dose, the animals were weighed and the edema of the injected and uninjected paws was determined by difference. On day 29 each animal was examined for the presence of secondary lesions. A score of 1 was given for each of the following observations: ankylosis of the uninjected paw, nodules on the ears and/or tail, and swelling of the forepaws. Linear regression analysis, potency, and 95% confidence limits were determined by the method described by Bliss and White.<sup>27</sup>

**B. Chronic Intestinal Toxicity (Multiple Oral Doses).**<sup>28</sup> Male and female Sprague–Dawley rats, weighing between 160 and 200 g, were randomly divided into groups of eight. Excluding the weekend, compounds were orally administered on a daily basis for 11 days. Twenty-four hours after the last dose, the rats were killed with chloroform or carbon dioxide, and the intestines were examined for the presence of ulcers. The severity of lesions was scored in increments of 10, from 0 for no damage to +40 for maximum damage, plus 10 for perforations and/or adhesions, and an additional 10 if the animal died. Growth of the animals was also monitored during the course of the experiment.

**C. Cyclooxygenase Inhibition.** Cyclooxygenase activity was determined polarographically with a YSI Model 50 Oxygen Monitor.<sup>29</sup> Standard assays were conducted at 30 °C in 3.0 mL of reaction buffer, containing 100 mM Tris-HCl buffer (pH 8.0), 1.0 mM phenol, 2.0  $\mu$ M hematin, and detergent-solubilized sheep vesicular gland microsomal powder (70  $\mu$ g). Reactions were initiated by addition of 300 nmol of an aqueous suspension of ammonium arachidonate. The instrument signal was digitized by a Beckman Instruments Co. digimetry instrument coupler and acquired by a Hewlett-Packard Model 1000 minicomputer. Cyclooxygenase optimal velocities were calculated either from recorder tracings of oxygen concentration or from the digitized, differentiated instrument signal by using the RSMTH program of CALS (Computer Automated Laboratory System; Beckman Instruments Co.). Assays were conducted in triplicate.

**General Procedures.** Melting points were determined in open capillary tubes in a Thomas-Hoover melting point apparatus and are uncorrected; <sup>1</sup>H NMR spectra were obtained in CDCl<sub>3</sub> or Me<sub>2</sub>SO-*d*<sub>6</sub> with Me<sub>4</sub>Si as internal standard on a Varian A-60 or Varian EM-360L spectrometer; <sup>13</sup>C NMR spectra were obtained in the same solvents on a Varian FT-80A spectrometer; mass spectra were determined on a Varian MAT-44 mass spectrometer; IR spectra were run as KBr pellets on a Beckman IR8 or Perkin-Elmer 297 IR spectrophotometer. Spectral data for all reported compounds were consistent with assigned structures. Purifications were done by column chromatography on silica gel or Florisil and by high-pressure liquid chromatography with use of a Waters Prep LC-500A apparatus with a PrepPAK-500 silica cartridge. Analytical results for compounds followed by elemental

symbols are within  $\pm 0.4\%$  of theory and were determined on a Perkin-Elmer Model 240 CHN analyzer or on a Control Equipment Corporation 240-XHA CHN analyzer. Indomethacin was obtained from Merck and Co., Inc.

**2-Amino-3-benzoyl- $\alpha$ -(methylthio)benzeneacetamide (31).** To a cold ( $-70^\circ\text{C}$ ) solution of 19.7 g (0.1 mol) of 2-aminobenzophenone in 300 mL of  $\text{CH}_2\text{Cl}_2$  was added a solution of 11.5 g (0.1 mol) of 95% *tert*-butyl hypochlorite in 30 mL of  $\text{CH}_2\text{Cl}_2$ , followed in 10 min by the addition of a solution of 10.5 g (0.1 mol) of (methylthio)acetamide in 300 mL of THF. The temperature was maintained at or below  $-55^\circ\text{C}$  during these additions. After 1 h at  $-60^\circ\text{C}$ , the mixture was allowed to warm to ambient temperature, and the precipitates were collected by filtration. This solid was slurried in 200 mL of  $\text{CH}_2\text{Cl}_2$  and 11 g (0.11 mol) of  $(\text{C}_2\text{H}_5)_3\text{N}$  was added. The mixture was stirred for 5 min and then the yellow-orange solution was washed twice with 100-mL portions of  $\text{H}_2\text{O}$ . The organic phase was dried ( $\text{MgSO}_4$ ) and concentrated. The residue was triturated with  $(\text{C}_2\text{H}_5)_2\text{O}$ , collected by filtration, and dried to yield 13.0 g (43%) of 31 as a light-yellow powder, mp  $153\text{--}155^\circ\text{C}$ . Anal. ( $\text{C}_{16}\text{H}_{16}\text{N}_2\text{O}_2\text{S}$ ) C, H, N.

**2-Amino-3-(4-chlorobenzoyl)- $\alpha$ -(phenylthio)benzeneacetamide (32).** To a cold ( $-70^\circ\text{C}$ ) solution of 34.6 g (0.15 mol) of 2-amino-4'-chlorobenzophenone in 500 mL of  $\text{CH}_2\text{Cl}_2$  was added 17.3 g (0.15 mol) of 95% *tert*-butyl hypochlorite. After 10 min, a solution of 25.0 g (0.15 mol) of (phenylthio)acetamide in 400 mL of THF was added over a period of 20 min while the temperature was maintained below  $-65^\circ\text{C}$ . After 2 h, 20 g (0.2 mol) of  $(\text{C}_2\text{H}_5)_3\text{N}$  was added, and the mixture was allowed to warm to ambient temperature. The mixture was concentrated, and the residue was partitioned between  $\text{H}_2\text{O}$  and  $\text{CH}_2\text{Cl}_2$ . Material insoluble in either phase was collected by filtration, washed with 20% aqueous  $\text{C}_2\text{H}_5\text{OH}$ , and dried to yield 36 g (61%) of 32 as a light-yellow powder, mp  $189\text{--}191^\circ\text{C}$ . Anal. ( $\text{C}_{21}\text{H}_{17}\text{ClN}_2\text{O}_2\text{S}$ ) C, H, N.

**2-Amino-3-benzoyl- $\alpha$ -(methylthio)benzeneacetonitrile (33).** To a cold ( $-68^\circ\text{C}$ ) slurry of 29.6 g (0.15 mol) of 2-aminobenzophenone and 13.1 g (0.15 mol) of (methylthio)acetonitrile in 400 mL of  $\text{CH}_2\text{Cl}_2$  was added dropwise 16.8 g (0.155 mol) of *tert*-butyl hypochlorite at such a rate that the temperature did not exceed  $-64^\circ\text{C}$ . The solution was stirred at  $-69^\circ\text{C}$  for 1 h, treated with 15.7 g (0.155 mol) of  $(\text{C}_2\text{H}_5)_3\text{N}$  in one portion, and allowed to warm to ambient temperature. The solution was washed twice with  $\text{H}_2\text{O}$ , dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated to give 45.2 g of dark oil. The oil was purified by column chromatography on 1 kg of silica gel with a gradient elution of 50–100% benzene in petroleum ether ( $60\text{--}110^\circ\text{C}$ ). The appropriate fractions were combined and concentrated to yield 22.5 g (53%) of 33 as tan crystals, mp  $107\text{--}108^\circ\text{C}$  (2-propanol). Anal. ( $\text{C}_{16}\text{H}_{14}\text{N}_2\text{OS}$ ) C, H, N.

**2-Amino-3-(4-chlorobenzoyl)- $\alpha$ -(methylthio)benzeneacetonitrile (34).** To a cold ( $-70^\circ\text{C}$ ) solution of 46.3 g (0.2 mol) of 2-amino-4'-chlorobenzophenone and 17.4 g (0.2 mol) of (methylthio)acetonitrile in 1 L of  $\text{CH}_2\text{Cl}_2$  was added dropwise 22.2 g (0.21 mol) of *tert*-butyl hypochlorite at such a rate that the temperature did not exceed  $-65^\circ\text{C}$ . The solution was stirred at  $-70^\circ\text{C}$  for 1 h and then 21.2 g (0.21 mol) of  $(\text{C}_2\text{H}_5)_3\text{N}$  was added in one portion. The solution was allowed to warm to ambient temperature, washed twice with  $\text{H}_2\text{O}$ , dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated. The residue crystallized when it was triturated with  $(\text{C}_2\text{H}_5)_2\text{O}$ . The solid was collected by filtration and recrystallized from 2-propanol to yield 43.0 g (68%) of 34 as a tan solid, mp  $122^\circ\text{C}$  dec. Anal. ( $\text{C}_{16}\text{H}_{13}\text{ClN}_2\text{OS}$ ) C, H, N.

**Method A. 2-Amino-3-benzoylbenzeneacetamide (5).** A solution of 9.7 g (0.032 mol) of 31 in 100 mL of THF was treated with 80 g of a commercial (successively washed thrice with  $\text{H}_2\text{O}$  and thrice with THF) preparation of Raney nickel. The mixture was stirred mechanically for 15 min and then cautiously filtered through Celite. The filtrate was concentrated, and the residue was recrystallized from 2-propanol to yield 6.0 g (73%) of 5 as yellow needles, mp  $178\text{--}180^\circ\text{C}$ . Anal. ( $\text{C}_{15}\text{H}_{14}\text{N}_2\text{O}_2$ ) C, H, N.

**7-(Cyclohexylcarbonyl)-1,3-dihydro-3-(methylthio)-2H-indol-2-one (35).** To a cold ( $-70^\circ\text{C}$ ) solution of 59 g (0.29 mol) of (2-aminophenyl)cyclohexylmethanone<sup>30</sup> and 40 g (0.30 mol) of ethyl (methylthio)acetate in 1 L of  $\text{CH}_2\text{Cl}_2$  was added dropwise 34.4 g (0.30 mol) of 95% *tert*-butyl hypochlorite at such a rate that the temperature did not exceed  $-65^\circ\text{C}$ . The solution was stirred for 1 h at  $-70^\circ\text{C}$ , treated with 40 g (0.4 mol) of  $(\text{C}_2\text{H}_5)_3\text{N}$

and allowed to warm to ambient temperature. An 800-mL portion of 4 N HCl was added and the mixture was vigorously stirred for 1 h. The layers were separated, and the organic layer was dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated. The residue was recrystallized from 95%  $\text{C}_2\text{H}_5\text{OH}$  to yield 49 g (58%) of 35 as white needles, mp  $111.5\text{--}113.0^\circ\text{C}$ . Anal. ( $\text{C}_{16}\text{H}_{19}\text{NO}_2\text{S}$ ) C, H, N.

**7-(Cyclohexylcarbonyl)-1,3-dihydro-2H-indol-2-one (36).** A mixture of 46 g (0.14 mol) of 35 and 40 g (0.34 mol) of tin powder in 600 mL of 95%  $\text{C}_2\text{H}_5\text{OH}$  was heated to reflux and treated with 100 mL of concentrated HCl. The mixture was mechanically stirred and heated at reflux for 6 h and filtered hot. The filtrate was cooled and the resulting precipitate was collected by filtration and recrystallized from 2-propanol to yield 34 g (88%) of 36 as pink needles, mp  $122.5\text{--}123.5^\circ\text{C}$ . Anal. ( $\text{C}_{15}\text{H}_{17}\text{NO}_2$ ) C, H, N.

**Method B. 2-Amino-3-(cyclohexylcarbonyl)benzeneacetic Acid, Sodium Salt, Hemihydrate (16).** A mixture of 20 g (0.08 mol) of 36 in 250 mL of 3 N NaOH was heated at reflux under a nitrogen atmosphere for 16 h. The mixture was cooled, and the resulting precipitate was collected by filtration and recrystallized twice from 1% aqueous 2-propanol to give 4.2 g (17%) of 16 as a light-yellow powder, mp  $235\text{--}240^\circ\text{C}$  dec. Anal. ( $\text{C}_{15}\text{H}_{18}\text{NNaO}_3\cdot 0.5\text{H}_2\text{O}$ ) C, H, N.

**Method C. 2-Amino-3-(hydroxyphenylmethyl)benzeneacetic Acid, Sodium Salt (13).** A solution of 14.8 g (0.05 mol) of 1 in 250 mL of  $\text{H}_2\text{O}$  was hydrogenated in a Parr apparatus over 10% Pd/C at ambient temperature overnight. The mixture was filtered through Celite, and the filtrate was concentrated. Absolute ethanol was added to the residue, and the mixture concentrated to azeotropically remove  $\text{H}_2\text{O}$ . This process was repeated twice to give a white solid. The solid was recrystallized successively from  $\text{CH}_3\text{OH}/(\text{C}_2\text{H}_5)_2\text{O}$  and  $\text{C}_2\text{H}_5\text{OH}/\text{H}_2\text{O}$  to yield 7.0 g (53%) of 13 as a white solid, mp  $273^\circ\text{C}$ . Anal. ( $\text{C}_{15}\text{H}_{14}\text{NNaO}_3$ ) C, H, N.

**Method D. 2-Amino-3-[(4-chlorophenyl)hydroxy-methyl]benzeneacetic Acid, Sodium Salt (14).** A mixture of 9.0 g (0.029 mol) of 2 in 200 mL of  $\text{H}_2\text{O}$  and 100 mL of 2% NaOH was filtered through Celite, and the filtrate was treated with 1.1 g (0.03 mol) of  $\text{NaBH}_4$ . The mixture was stirred at ambient temperature for 3 h and then filtered through Celite. The filtrate was made acidic with  $\text{CH}_3\text{CO}_2\text{H}$  (foaming). The resulting white solid was collected by filtration and washed with  $\text{H}_2\text{O}$ . The solid was stirred with 150 mL  $\text{H}_2\text{O}$  and 1.1 g (0.03 mol) of NaOH. The solution was filtered, and the filtrate's pH was adjusted to 8.5 with 15% HCl. The mixture was allowed to stand at ambient temperature overnight and then filtered through Celite, and the filtrate was then concentrated. The residue was chased twice with absolute  $\text{C}_2\text{H}_5\text{OH}$  to leave a white solid. The solid was recrystallized from  $\text{H}_2\text{O}$  to yield 4.2 g (47%) of 14 as an off-white powder, mp  $138^\circ\text{C}$  dec. Anal. ( $\text{C}_{15}\text{H}_{13}\text{ClNNaO}_3\cdot 0.25\text{H}_2\text{O}$ ) C, H, N.

**Method E. 2-Amino-3-(4-chlorobenzoyl)benzeneacetic Acid, Ethyl Ester (4).** A solution of 14 g (0.045 mol) of 2 in 150 mL of  $(\text{CH}_3)_2\text{NCHO}$  was treated with 30 g (0.19 mol) of  $\text{C}_2\text{H}_5\text{I}$ , and the reaction mixture was stirred at ambient temperature for 2.5 h. The solution was poured into 1.5 L of  $\text{H}_2\text{O}$  and allowed to stand. The resulting precipitate was collected by filtration, washed with  $\text{H}_2\text{O}$ , dried, and recrystallized from absolute  $\text{C}_2\text{H}_5\text{OH}$  to yield 11.6 g (81%) of 4 as yellow flakes, mp  $101\text{--}102^\circ\text{C}$ . Anal. ( $\text{C}_{17}\text{H}_{16}\text{ClNO}_3$ ) C, H, N.

**Method F. 2-Amino-3-(hydroxyphenylmethyl)benzene-ethanol (20).** A mechanically stirred slurry of 5.5 g (0.145 mol) of  $\text{LiAlH}_4$  in 60 mL of dry (freshly distilled from  $\text{LiAlH}_4$ ) THF was treated with a solution of 19.4 g (0.068 mol) of 3<sup>23</sup> in 120 mL of THF, and the mixture was heated at reflux under a nitrogen atmosphere for 2 h. The mixture was cooled (ice bath) and treated successively with 5.5 mL of  $\text{H}_2\text{O}$ , 5.5 mL of 15% NaOH, and 16.5 mL of  $\text{H}_2\text{O}$ . The mixture was filtered through Celite, and the filtrate was concentrated. The residue was recrystallized from toluene to yield 10.2 g (62%) of 20 as off-white needles, mp  $101^\circ\text{C}$ . Anal. ( $\text{C}_{15}\text{H}_{17}\text{NO}_2$ ) C, H, N.

**Method G. 2-Amino-3-(phenylmethyl)benzeneacetic Acid, Sodium Salt (15).** A solution of 14.8 g (0.05 mol) of 1 in 250 mL of  $\text{H}_2\text{O}$  was hydrogenated in a Parr apparatus over 10% Pd/C at  $50\text{--}60^\circ\text{C}$  for 32 h. The mixture was filtered through Celite, and the filtrate was concentrated. The residue was recrystallized from 95%  $\text{C}_2\text{H}_5\text{OH}$  to yield 7.4 g (56%) of 15 as a white solid, mp  $204\text{--}206^\circ\text{C}$ . Anal. ( $\text{C}_{15}\text{H}_{14}\text{NNaO}_2\cdot 0.25\text{H}_2\text{O}$ ) C, H, N.

**Method H. 3-(4-Chlorobenzoyl)-2-[[trifluoromethyl-carbonyl]amino]benzeneacetic Acid, Ethyl Ester (10).** To a solution of 3.2 g (0.01 mol) of 4 in 100 mL of  $\text{CH}_2\text{Cl}_2$  was added a solution of 2.1 g (0.01 mol) of trifluoroacetic anhydride in 10 mL of  $\text{CH}_2\text{Cl}_2$ . The reaction mixture was stirred at ambient temperature for 15 min, washed twice with a saturated  $\text{NaHCO}_3$  solution, dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated. The residue was triturated with petroleum ether (30–60 °C), collected by filtration and dried to yield 3.2 g (78%) of 10 as a tan solid, mp 68–70 °C. Anal. ( $\text{C}_{19}\text{H}_{15}\text{ClF}_3\text{NO}_4$ ) C, H, N.

**Method I. [2-Amino-3-(2-hydroxyethyl)phenyl](4-chlorophenyl)methanone (19).** A mixture of 8.4 g (0.03 mol) of 21 and 13 g (0.15 mol) of activated  $\text{MnO}_2$  in 250 mL of  $\text{CH}_2\text{Cl}_2$  and 150 mL of THF was heated at reflux for 18 h. The hot mixture was filtered through Celite, and the filtrate was concentrated. The residue was recrystallized from 2-propanol to yield 5.3 g (64%) of 19 as a yellow solid, mp 129–131.5 °C. Anal. ( $\text{C}_{15}\text{H}_{14}\text{ClNO}_2$ ) C, H, N.

**(3-Chloro-2-nitrophenyl)phenylmethanone (37).** To a cold, stirred mixture of 10.8 mL of 90%  $\text{H}_2\text{O}_2$  and 250 mL of  $\text{CH}_2\text{Cl}_2$  was added 100 g (67.6 mL) of trifluoroacetic anhydride dropwise over a 45-min period. The ice bath was removed, and a solution of 23.1 g (0.1 mol) of (2-amino-3-chlorophenyl)phenylmethanone<sup>15</sup> in 100 mL of  $\text{CH}_2\text{Cl}_2$  was added dropwise over a 45-min period. The dark solution was heated on a steam bath for 1 h, cooled, and washed successively with two 200-mL portions of cold  $\text{H}_2\text{O}$ , two 200-mL portions of cold 10%  $\text{Na}_2\text{CO}_3$  (emulsion), and once with brine. The  $\text{CH}_2\text{Cl}_2$  solution was dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated. The residue was purified by column chromatography on 250 g of silica gel with  $\text{C}_6\text{H}_6$  as eluent. The appropriate fractions were combined and concentrated to yield 15.3 g (59%) of 37 as a tan solid, mp 67–69 °C (2-propanol). Anal. ( $\text{C}_{13}\text{H}_9\text{ClNO}_3$ ) C, H, N.

**(3-Chloro-2-nitrophenyl)(4-chlorophenyl)methanone (38).** With use of the above procedure, 10 mL of 90%  $\text{H}_2\text{O}_2$ , 100 g of trifluoroacetic anhydride, and 26.6 g (0.1 mol) of (2-amino-3-chlorophenyl)(4-chlorophenyl)methanone<sup>15</sup> in a total of 350 mL of  $\text{CH}_2\text{Cl}_2$  gave 11.9 g (40%) of 38 as a white solid, mp 147–148 °C (absolute  $\text{C}_2\text{H}_5\text{OH}$ ). Anal. ( $\text{C}_{13}\text{H}_7\text{Cl}_2\text{NO}_3$ ) C, H, N.

**2-(3-Benzoyl-2-nitrophenyl)propanedioic Acid, Diethyl Ester (39).** A mixture of 1.9 g (0.044 mol) of washed (petroleum ether, 30–60 °C) 57%  $\text{NaH}$ /oil in 25 mL of dry  $(\text{CH}_3)_2\text{SO}$  was heated to 100 °C and treated with a solution of 7.0 g (0.044 mol) of diethyl malonate in 25 mL of  $(\text{CH}_3)_2\text{SO}$ . The mixture was stirred until all solids had dissolved and then a solution of 5.4 g (0.021 mol) of 37 in 15 mL of  $(\text{CH}_3)_2\text{SO}$  was added. The dark solution was heated at 100 °C for 1 h and then poured into 800 mL of ice/ $\text{H}_2\text{O}$ . The mixture was extracted with three 100-mL portions of  $\text{C}_6\text{H}_6$ , and the combined extracts were washed twice with  $\text{H}_2\text{O}$  and once with brine, dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated. The residue was recrystallized from 2-propanol to yield 3.1 g (46%) of 39 as an off-white solid, mp 130–131 °C. Anal. ( $\text{C}_{20}\text{H}_{19}\text{NO}_7$ ) C, H, N.

**2-[3-(4-Chlorobenzoyl)-2-nitrophenyl]propanedioic Acid, Diethyl Ester (40).** With use of the above procedure, 3.9 g (0.08 mol) of 57%  $\text{NaH}$ /oil, 12.8 g (0.08 mol) of diethyl malonate, and 11.0 g (0.037 mol) of 38 in a total of 100 mL of  $(\text{CH}_3)_2\text{SO}$  gave 8.6 g (55%) of 40 as an off-white solid, mp 96–100 °C (2-propanol). Anal. ( $\text{C}_{20}\text{H}_{18}\text{ClNO}_7$ ) C, H, N.

**Method J. 3-Benzoyl-2-nitrobenzeneacetic Acid (23).** A solution of 11.5 g (0.03 mol) of 39 in 50 mL of 20%  $\text{H}_2\text{SO}_4$  and 50 mL of glacial  $\text{CH}_3\text{CO}_2\text{H}$  was heated at reflux under a nitrogen atmosphere overnight. The solution was concentrated, and the residue was made basic with 450 mL of 2 N  $\text{KHCO}_3$ . The mixture was extracted twice with  $(\text{C}_2\text{H}_5)_2\text{O}$ , and the aqueous layer was made acidic with 20 mL of concentrated  $\text{H}_2\text{SO}_4$ . The solid which precipitated was collected by filtration, washed with  $\text{H}_2\text{O}$ , and recrystallized from aqueous 2-propanol to yield 4.1 g (48%) of 23 as an off-white solid, mp 160–162 °C. Anal. ( $\text{C}_{15}\text{H}_{11}\text{NO}_6$ ) C, H, N.

**7-Methyl-3-phenyl-2,1-benzisoxazole (41).** A solution of 8.4 g (0.04 mol) of (2-amino-3-methylphenyl)phenylmethanone,<sup>15</sup> 150 mL of glacial  $\text{CH}_3\text{CO}_2\text{H}$ , and 40 mL of 30%  $\text{H}_2\text{O}_2$  was allowed to stand at ambient temperature for 3 days. The solution was poured into 800 mL of ice/ $\text{H}_2\text{O}$ , and the solid which precipitated was collected by filtration, washed with  $\text{H}_2\text{O}$ , dried, and recryst-

allized from 2-propanol to yield 4.1 g (49%) of 41 as tan crystals, mp 73–75 °C. Anal. ( $\text{C}_{14}\text{H}_{11}\text{NO}$ ) C, H, N.

**3-(4-Chlorophenyl)-7-methyl-2,1-benzisoxazole (42).** With use of the above procedure, 49 g (0.2 mol) of (2-amino-3-methylphenyl)(4-chlorophenyl)methanone,<sup>15</sup> 1 L of glacial  $\text{CH}_3\text{CO}_2\text{H}$ , and 200 mL of 30%  $\text{H}_2\text{O}_2$  gave 16.4 g (34%) of 42 as an off-white solid, mp 134–136 °C ( $\text{C}_6\text{H}_{12}$ ). Anal. ( $\text{C}_{14}\text{H}_{10}\text{ClNO}$ ) C, H, N.

**7-(Bromomethyl)-3-phenyl-2,1-benzisoxazole (43).** A mixture of 23.5 g (0.112 mol) of 41, 20.0 g (0.112 mol) of *N*-bromosuccinimide, and 0.5 g of dibenzoyl peroxide in 400 mL of  $\text{CCl}_4$  was heated at reflux while being illuminated by a white light lamp for 3 h. The mixture was filtered, and the filtrate was concentrated. The residue was recrystallized from 2-propanol to yield 25.2 g (77%) of 43 as yellow needles, mp 125.0–125.5 °C. Anal. ( $\text{C}_{14}\text{H}_{10}\text{BrNO}$ ) C, H, N.

**3-(4-Chlorophenyl)-7-(bromomethyl)-2,1-benzisoxazole (44).** With use of the above procedure, 15.7 g (0.065 mol) of 42, 11.6 g (0.065 mol) of *N*-bromosuccinimide, and 0.5 g of dibenzoyl peroxide in 400 mL of  $\text{CCl}_4$  gave 12.0 g (58%) of 44 as a fluffy, pale-yellow solid, mp 153–155 °C ( $\text{CH}_3\text{CN}$ ). Anal. ( $\text{C}_{14}\text{H}_9\text{BrClNO}$ ) C, H, N.

**3-Phenyl-2,1-benzisoxazole-7-acetonitrile (45).** A mixture of 17.3 g (0.06 mol) of 43, 17 g (0.26 mol) of KCN, 80 mL of  $\text{H}_2\text{O}$ , and 120 mL of dioxane was heated at reflux under a nitrogen atmosphere for 2 h. The mixture was cooled and diluted with 300 mL of  $\text{CH}_2\text{Cl}_2$ . The organic layer was separated, washed with  $\text{H}_2\text{O}$ , dried ( $\text{MgSO}_4$ ), and concentrated. The residue was recrystallized twice from absolute  $\text{C}_2\text{H}_5\text{OH}$  to give 10.3 g (74%) of 45 as yellow crystals, mp 125–138 °C. Anal. ( $\text{C}_{15}\text{H}_{10}\text{N}_2\text{O}$ ) C, H, N.

**3-(4-Chlorophenyl)-2,1-benzisoxazole-7-acetonitrile (46).** With use of the above procedure, 11.5 g (0.036 mol) of 44, 9.8 g (0.15 mol) of KCN, 75 mL of  $\text{H}_2\text{O}$ , and 150 mL of dioxane gave 5.8 g (61%) of 46 as a yellow-green powder, mp 165–169 °C (ethyl acetate). Anal. ( $\text{C}_{15}\text{H}_9\text{ClN}_2\text{O}$ ) C, H, N.

**Method K. 3-Phenyl-2,1-benzisoxazole-7-acetic Acid (25).** A mixture of 7.0 g (0.03 mol) of 45, 25 mL of 20%  $\text{NaOH}$ , and 75 mL of 95%  $\text{C}_2\text{H}_5\text{OH}$  was heated at reflux under a nitrogen atmosphere for 17 h. The mixture was diluted to 500 mL with  $\text{H}_2\text{O}$ , titrated with concentrated  $\text{HCl}$  to pH 7.0, and filtered. The filtrate was treated with charcoal, filtered through Celite, and then acidified with concentrated  $\text{HCl}$ . The precipitate was collected and recrystallized from 2-propanol to yield 5.0 g (66%) of 25 as yellow needles, mp 180.5–183.5 °C. Anal. ( $\text{C}_{15}\text{H}_{11}\text{NO}_3$ ) C, H, N.

**Method L. 1-(2-Amino-3-benzoylphenyl)ethanone (27).** A purple solution of 6.8 g (0.03 mol) of 17<sup>15</sup> and 21.8 g (0.07 mol) of benzyltriethylammonium permanganate<sup>21</sup> in 200 mL of  $\text{CH}_2\text{Cl}_2$  became a brown-black slurry on stirring for 16 h. The mixture was filtered, and the filter cake was washed with  $\text{CH}_2\text{Cl}_2$ . The filtrate and washings were combined and concentrated, and the residue was purified by column chromatography on 150 g of silica gel with  $\text{C}_6\text{H}_6$  as eluent. The appropriate fractions were combined and concentrated to yield 2.1 g (29%) of 27 as yellow crystals, mp 92–93 °C ( $\text{C}_6\text{H}_{14}/(\text{C}_2\text{H}_5)_2\text{O}$ ). Anal. ( $\text{C}_{15}\text{H}_{13}\text{NO}_2$ ) C, H, N.

**[3-[(Dimethylamino)methyl]-1*H*-indol-7-yl]phenylmethanone (47).** To a solution of 33.1 g (0.15 mol) of (1*H*-indol-7-yl)phenylmethanone<sup>23</sup> in 20 mL of glacial  $\text{CH}_3\text{CO}_2\text{H}$  and 100 mL of absolute  $\text{C}_2\text{H}_5\text{OH}$  was added a cold solution of 18 g (0.16 mol) of 40% aqueous  $(\text{CH}_3)_2\text{NH}$ , 12.2 g (0.15 mol) of 37% formalin, and 25 mL of glacial  $\text{CH}_3\text{CO}_2\text{H}$ . The mixture was heated on a steam bath for 0.5 h and concentrated, and the residue was partitioned between  $\text{CH}_2\text{Cl}_2$  and 5%  $\text{NaOH}$ . The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated and the residue was recrystallized from 2-propanol to yield 29 g (70%) of 47 as light-yellow crystals, mp 111.0–113.5 °C. Anal. ( $\text{C}_{18}\text{H}_{18}\text{N}_2\text{O}$ ) C, H, N.

**(4-Chlorophenyl)[3-[(dimethylamino)methyl]-1*H*-indol-7-yl]methanone (48).** With use of the above procedure, 28.1 g (0.11 mol) of (4-chlorophenyl)(1*H*-indol-7-yl)methanone,<sup>1</sup> 13.5 g (0.12 mol) of 40% aqueous  $(\text{CH}_3)_2\text{NH}$ , and 9.3 g (0.115 mol) of 37% formalin in a total of 45 mL of glacial  $\text{CH}_3\text{CO}_2\text{H}$  gave 35.3 g (99%) of 48 as a white solid, mp 95–99 °C (2-propanol). Anal. ( $\text{C}_{18}\text{H}_{17}\text{ClN}_2\text{O}$ ) C, H, N.

**2-[(7-Benzoyl-1*H*-indol-3-yl)methyl]propanedioic Acid, Diethyl Ester (49).** A mixture of 19.4 g (0.07 mol) of 47 and 32.5 g (0.2 mol) of diethyl sodiomalonate prepared from 8.5 g (0.2

mol) of 57% NaH in oil and 32 g (0.2 mol) of diethyl malonate in 50 mL of xylene was heated at reflux for 17 h. The mixture was cooled, diluted with  $(C_2H_5)_2O$ , and washed with  $H_2O$ . The solvent and excess reagents were removed by distillation at high vacuum. The pot residue was crystallized successively from 2-propanol and then  $[(CH_3)_2CH]_2O$  to give 12.6 g (46%) of 47 as light-yellow powder, mp 86–88 °C. Anal. ( $C_{23}H_{23}NO_5$ ) C, H, N.

**2-[[7-(4-Chlorobenzoyl)-1H-indol-3-yl]methyl]-propanedioic Acid, Diethyl Ester (50).** With use of the above procedure, 4.2 g (0.1 mol) of 57% NaH/oil, 80 g (0.5 mol) of diethyl malonate, and 31.2 g (0.1 mol) of 48 in 30 mL of  $(CH_3)_2SO$  gave 28.7 g (67%) of 50 as yellow crystals, mp 102.0–102.5 °C (90% aqueous  $C_2H_5OH$ ). Anal. ( $C_{23}H_{22}ClNO_5$ ) C, H, N.

**2-[(7-Benzoyl-1H-indol-3-yl)methyl]-1,3-propanedioic Acid (51).** A mixture of 10.0 g (0.025 mol) of 49 in 150 mL of 3 N NaOH was heated at reflux for 18 h and then treated with charcoal, cooled, and filtered. The dark-yellow filtrate was acidified by the dropwise addition of 50 mL of concentrated HCl. The addition of 20 mL of  $CH_2Cl_2$  caused the formation of a precipitate, which was collected and recrystallized from  $CHCl_3/CH_3OH$  to give 6.0 g (70%) of 51 as off-white crystals, mp 188–189 °C. Anal. ( $C_{19}H_{15}NO_5$ ) C, H, N.

**2-[[7-(4-Chlorobenzoyl)-1H-indol-3-yl]methyl]-propanedioic Acid (52).** With use of the above procedure, 28.8 g (0.067 mol) of 50 and 600 mL of 3 N NaOH gave 19.5 g (79%) of 52 as pale-yellow crystals, mp 197–201 °C dec ( $CHCl_3/CH_3OH$ ). Anal. ( $C_{19}H_{14}ClNO_5$ ) C, H, N.

**7-Benzoyl-1H-indole-3-propanoic Acid (53).** A 2.4 g (0.07 mol) sample of 51 was heated at 190 °C under vacuum for 0.5 h (until gas evolution ceased). The syrup was cooled to give a quantitative yield of 2.1 g of 53 as a yellow solid, mp 166.5–168.5 °C. Anal. ( $C_{18}H_{15}NO_3$ ) C, H, N.

**7-(4-Chlorobenzoyl)-1H-indole-3-propanoic Acid (54).** With use of the above procedure 18.9 g (0.05 mol) of 52 gave a quantitative yield of 16.6 g of 54 as a dark-yellow solid, mp 190–202 °C. Anal. ( $C_{18}H_{17}ClNO_3$ ) C, H, N.

**2-Amino-3-(4-chlorobenzoyl)- $\gamma$ -oxobenzenebutanoic Acid, Ethyl Ester (55).** A solution of 13.1 g (0.04 mol) of 54 in 450 mL of ethyl acetate and 150 mL of absolute  $C_2H_5OH$  was treated with ozone (Wellsbach ozonator) until  $O_3$  passed through the solution. The solution was then stirred with an aqueous solution of KI, followed by a wash with aqueous  $Na_2S_2O_3$ . The organic fraction was concentrated, and the residue was dissolved in 250 mL of 95%  $C_2H_5OH$ . The solution was heated to reflux, 150 mL of 6 N HCl was added, and heating was continued for 18 h. The mixture was diluted with 400 mL of  $H_2O$ , and a gummy solid was separated. The gum was partitioned between dilute NaOH solution and  $CH_2Cl_2$ . The basic aqueous fraction contained only a small amount of acidic material upon acidification, so it was discarded. The  $CH_2Cl_2$  layer was dried ( $Na_2SO_4$ ) and filtered through a column of silica gel. The yellow-colored eluent was concentrated, and the residue was recrystallized from cyclohexane to give 3.5 g (26%) of 55 as a bright-yellow powder, mp 112–115 °C. Anal. ( $C_{19}H_{18}ClNO_4$ ) C, H, N.

**Method M. 2-Amino-3-benzoyl- $\gamma$ -oxobenzenebutanoic Acid (28).** A solution of 8.7 g (0.03 mol) of 53 in 300 mL of ethyl acetate and 100 mL of absolute  $C_2H_5OH$  was ozonized (Wellsbach ozonator) until  $O_3$  passed through the solution. The yellow solution was then treated with 16.6 g (0.1 mol) of KI in 30 mL of  $CH_3CO_2H$  and 30 mL of  $H_2O$ . After 1 h of stirring, the liberated  $I_2$  was removed by washing with a 15%  $Na_2S_2O_3$  solution, and the yellow organic layer was concentrated. The residue was dissolved in 100 mL of  $C_2H_5OH$  and 20 mL of 6 N HCl and heated at reflux for 16 h. The dark red solution was concentrated, and

the residue was partitioned between 5% NaOH and  $CH_2Cl_2$ . The layers were separated, and the aqueous layer was made strongly acidic with concentrated HCl. The pH was adjusted to 2–3 by the addition of 5% NaOH, and the precipitate was collected by filtration, washed with  $H_2O$ , dried, and recrystallized from  $C_6H_6/[(CH_3)_2CH]_2O$  to yield 5.9 g (67%) of 28 as a yellow powder, mp 161.0–162.5 °C. Anal. ( $C_{17}H_{15}NO_4$ ) C, H, N.

**Method N. 2-Amino-3-(4-chlorobenzoyl)- $\gamma$ -oxobenzenebutanoic Acid (29).** A solution of 3.3 g (0.009 mol) of 55 in 70 mL of hot  $C_2H_5OH$  was treated with 40 mL of 4 N NaOH and the mixture was heated at reflux for 18 h. The hot mixture was filtered, and the insoluble material was discarded. The filtrate was cooled, and the precipitate was collected by filtration. This precipitate was partitioned between 2 N HCl and  $CH_2Cl_2$ . The organic layer was separated, dried ( $MgSO_4$ ), and concentrated to give 2.7 g (89%) of 29 as bright-yellow crystals, mp 172–177 °C. Anal. ( $C_{17}H_{14}ClNO_4$ ) C, H, N.

**Method O. 2-Amino-3-benzoyl- $\alpha$ -oxobenzeneacetic Acid, Sodium Salt, Hydrate (4:4:1) (22).** A solution of 4 g (0.016 mol) of 7-benzoyl-1H-indole-2,3-dione<sup>23</sup> in 100 mL of 1 N NaOH was stirred at ambient temperature for 0.25 h. The resulting precipitate was collected by filtration, washed with acetone, and recrystallized from  $C_2H_5OH/H_2O/[(CH_3)_2CH]_2O$  to yield 2.6 g (55%) of 22 as bright-yellow flakes, mp 270 °C. Anal. ( $C_{15}H_{10}N NaO_4 \cdot 0.25H_2O$ ) C, H, N.

**Acknowledgment.** We thank Dr. Larry W. Jaques, Ashby F. Johnson, John B. Forehand, and Malcolm D. Stone who determined the spectra and analytical data; Dr. Stephen Cheung (deceased), Carol Gathright, Rosa Mealy, Johnnie Nicholes, Donna Reese, Carlene Steward, and Larry Wagner for their technical assistance in conducting the pharmacological assays; Linda A. Anderson and Leroy Jefferson for their technical assistance in providing the cyclooxygenase inhibition data.
