Summary

Protonation with HBF_4 of equimolar mixtures of $[\text{M}(\text{arene})\text{X}_2(\text{C}_5\text{H}_5\text{N})]$ and $[\text{M}(\text{arene})\text{X}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ in methanol provides a convenient, high yield, synthetic route to the triple halide bridged arene complexes $[\text{M}_2(\text{arene})_2\text{X}_3]\text{BF}_4$ ($\text{M} = \text{Ru}$; $\text{X} = \text{Cl}, \text{Br}$; arene = C_6H_6 , 1,3,5- $\text{C}_6\text{H}_3\text{Me}_3$; $\text{M} = \text{Os}$, $\text{X} = \text{Cl}$, arene = C_6H_6).

Recently we reported that reaction of $[\{\text{Ru}(\eta\text{-C}_6\text{H}_6)\text{Cl}_2\}_2]$ in methanol at ambient temperature with a slight excess of NH_4PF_6 for 24 h gave, in high yield, $[(\eta\text{-C}_6\text{H}_6)\text{RuCl}_3\text{Ru}(\eta\text{-C}_6\text{H}_6)]\text{PF}_6$. The most likely mechanism of formation of this cation was proposed to be by intermolecular coupling of the weakly solvated monomers $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}_2(\text{MeOH})]$ and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}(\text{MeOH})_2]^+$. Unfortunately, attempts to prepare other triple halide bridged arene cations by reaction of the appropriate double halide bridged dimers with NH_4PF_6 in methanol were unsuccessful, probably because of the very insoluble nature of these $[\{\text{Ru}(\text{arene})\text{X}_2\}_2]$ compounds [1].

We now wish to report a more convenient, high yield, synthetic route to these $[\text{M}_2(\text{arene})_2\text{X}_3]^+$ cations (I). This involves the formation in situ of high equi-

$\text{M} = \text{Ru}, \text{X} = \text{Cl}, \text{Br}; \text{R} = \text{H} \text{ or } \text{Me}$

$\text{M} = \text{Os}, \text{X} = \text{Cl}; \text{R} = \text{H}$

molar concentrations of the solvated monomers $[M(\text{arene})X_2(\text{MeOH})]$ and $[M(\text{arene})X(\text{MeOH})_2]^+$ by protonation in methanol of the corresponding pyridine complexes $[M(\text{arene})X_2(\text{C}_5\text{H}_5\text{N})]$ and $[M(\text{arene})X(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ respectively.

Thus, for example, treatment of equimolar amounts of $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}_2(\text{C}_5\text{H}_5\text{N})]$ [2] and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ [1,3] in methanol with a slight excess of HBF_4 gave, after gently refluxing the solution for one hour, an almost quantitative yield of $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$. Similarly, reaction of $[\text{Ru}(\text{C}_6\text{H}_6)\text{Br}_2(\text{C}_5\text{H}_5\text{N})]$ and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Br}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ [3] with HBF_4 gave $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Br}_3]\text{BF}_4$ and analogous reactions with the appropriate pyridine monomers gave $[\text{Ru}_2(\text{C}_6\text{H}_3\text{Me}_3)_2\text{X}_3]\text{BF}_4$ ($\text{X} = \text{Cl}, \text{Br}$).

As observed earlier for the $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]^+$ cation [1], all these compounds undergo facile bridge cleavage reactions in solvents such as H_2O and Me_2SO , but fortunately, they are all soluble and stable in CH_3NO_2 . Thus, ^1H and $^{13}\text{C}\{-^1\text{H}\}$ NMR studies in CD_3NO_2 (Table 1) together with analytical data, conductivity (all 1/1 electrolytes) and far infrared studies (only bridging $\nu(\text{RuX})$ present) establish unequivocally the structure of the compounds.

In an attempt to make the mixed bridge compound $[(\text{C}_6\text{H}_6)\text{RuCl}_2\text{BrRu}(\text{C}_6\text{H}_6)]\text{-BF}_4$, equimolar amounts of $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}_2(\text{C}_5\text{H}_5\text{N})]$ and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Br}(\text{C}_5\text{H}_5\text{N})_2]\text{-PF}_6$ were treated with HBF_4/MeOH . However, although the product analysed closely for “ $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_2\text{Br}]\text{BF}_4$ ”, its ^1H NMR spectrum in CD_3NO_2 showed

TABLE 1

^1H AND $^{13}\text{C}\{-^1\text{H}\}$ NMR SPECTRA IN CD_3NO_2 OF SOME RUTHENIUM(II) AND OSMIUM(II) ARENE COMPLEXES

Compound	$^1\text{H}^a$	$^{13}\text{C}\{-^1\text{H}^a$
$[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$	5.944	82.04
$[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Br}_3]\text{BF}_4$	5.922	82.37
“ $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_2\text{Br}]\text{BF}_4$ ” “ $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{ClBr}_2]\text{BF}_4$ ”	5.944, 5.937, 5.929, 5.922	—
$[\text{Os}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$	6.64	73.55
$[\text{RuOs}(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$	6.46, 6.06	82.21, 73.82
$[\text{Ru}_2(\text{C}_6\text{H}_3\text{Me}_3)_2\text{Cl}_3]\text{BF}_4$	5.35(H), 2.22(Me)	102.01(CMe), 75.72(CH), 19.42(Me)
$[\text{Ru}_2(\text{C}_6\text{H}_6)(\text{C}_6\text{H}_3\text{Me}_3)\text{Cl}_3]\text{BF}_4$	5.92, 5.37(H), 2.20(Me)	102.01(CMe), 82.02, 75.89(CH), 19.28(Me)

^a Reference is $(\text{CH}_3)_4\text{Si}$; all singlets.

four $\eta\text{-C}_6\text{H}_6$ resonances at 5.944, 5.937, 5.929 and 5.922 ppm of relative intensity 8/12/6/1. The resonance at δ 5.944 ppm arises from $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$ and that at δ 5.922 ppm from $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Br}_3]\text{BF}_4$. Conversely, reaction of $[\text{Ru}(\text{C}_6\text{H}_6)\text{Br}_2(\text{C}_5\text{H}_5\text{N})]$ and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ (1/1 molar ratio) with HBF_4/MeOH gave a product analysing for " $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{ClBr}_2]\text{BF}_4$ " which showed the same four ^1H NMR $\eta\text{-C}_6\text{H}_6$ resonances but now with relative intensities 1/6/12/8. Thus, these experiments clearly show that statistical mixtures of $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]^+$, $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_2\text{Br}]^+$, $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{ClBr}_2]^+$ and $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Br}_3]^+$ and $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Br}_3]^+$ cations are formed in these reactions.

It is readily demonstrated that this facile halide exchange can occur prior to protonation since on mixing $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}_2(\text{PPh}_3)]^*$ and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Br}(\text{C}_5\text{H}_5\text{N})_2]^+$ in acetone- d_6 , ^1H NMR studies reveal that some $[\text{Ru}(\text{C}_6\text{H}_6)\text{Br}_2(\text{PPh}_3)]$ and $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}(\text{C}_5\text{H}_5\text{N})_2]^+$ are rapidly formed. However, the ^1H NMR spectrum of a mixture of $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$ and $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Br}_3]\text{BF}_4$ in CD_3NO_2 after several minutes at ambient temperature shows four $\eta\text{-C}_6\text{H}_6$ resonances, indicating that facile halide exchange can also occur after formation of the dimers (cf. the formation of some $[\text{PdPtCl}_4\text{L}_2]$ from reaction of $[\text{Pd}_2\text{Cl}_4\text{L}_2]$ and $[\text{Pt}_2\text{Cl}_4\text{L}_2]$ [4]).

In an attempt to synthesise the tetrameric cation $[\{\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}\}_4]^{4+}$ a suspension of $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ in methanol was treated with HBF_4 but the only product isolated was $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$ in low yield (ca. 25%). This clearly demonstrates that protonation removes some coordinated chloride as HCl which then reacts to form some $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}_2\text{MeOH}]$. Similarly, protonation of $[\text{Os}(\text{C}_6\text{H}_6)\text{Cl}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ [3] gave $[\text{Os}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$ whereas treatment of an equimolar mixture of $[\text{Ru}(\text{C}_6\text{H}_6)\text{Cl}_2(\text{C}_5\text{H}_5\text{N})]$ and $[\text{Os}(\text{C}_6\text{H}_6)\text{Cl}(\text{C}_5\text{H}_5\text{N})_2]\text{PF}_6$ with HBF_4/MeOH gave a statistical mixture of $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$, $[\text{Os}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$ and $[\text{RuOs}(\text{C}_6\text{H}_6)_2\text{Cl}_3]\text{BF}_4$. Mixing the pure ruthenium and osmium dimers at ambient temperature in CD_3NO_2 rapidly gave some $[\text{RuOs}(\text{C}_6\text{H}_6)_2\text{Cl}_3]^+$ cation.

Finally, using these methods, the $[(\text{C}_6\text{H}_6)\text{RuCl}_3\text{Ru}(\text{C}_6\text{H}_3\text{Me}_3)]^+$ cation can be generated, but not separated, from the $[\text{Ru}_2(\text{C}_6\text{H}_6)_2\text{Cl}_3]^+$ and $[\text{Ru}_2(\text{C}_6\text{H}_3\text{Me}_3)_2\text{Cl}_3]^+$ cations.
