

(too exhaustive to be useful; a few good references would be much more appropriate), on organometallic compounds of the Main Group V elements, on organoantimony compounds, on their analysis and on their medical, pharmaceutical and biocidal uses. The more specific sections will be a useful guide to the newcomer to organoantimony chemistry. A 29 page formula index concludes the book.

Happily for most readers, the present volume is one of the "new" Gmelins: it is written entirely in English. Those who are active in Group V organometallic chemistry will welcome this new book and will look forward to further volumes of this series.
