Page C31, paragraph 2 should read:

Tri-t-butoxy-praseodymium and -neodymium add three moles of CO₂ per lanthanide atom in hexane. In this case, according to the IR spectrum (1580, 1370 and 1250 cm⁻¹, Fig. 1) the insertion of CO₂ into the O—Ln bond occurs with formation of carbonate derivatives (t-BuOCO₂)₃Ln.

The formation of [PPN][RuCo₃(CO)₁₂], from the reaction of [PPN]-[Co(CO)₄], was in an unexpectedly low yield, in view of the previous results obtained with Na[Co(CO)₄] [9,10]. Unfortunately this complex is somewhat difficult to separate
