### Abstract

Unsymmetrical tetraorganotins,  $R_2R^1R^2Sn$  ( $R = Me$ ,  $R^1 = Bu$ ,  $R^2 = Pe$  ( $Pe = pentyl$ ) or  $Ph$ ;  $R = Bu$ ,  $R^1 = Pe$ ,  $R^2 = Ph$  or  $Me$ ;  $R = Pe$ ,  $R^1 = Bu$ ,  $R^2 = Me$  or  $Ph$ ),  $Bu_nR_{4-n}Sn$  ( $n = 1-3$ ,  $R = Me$  or  $Pe$ ) and  $Pe_2R_2Sn$  ( $R = Me$  or  $Ph$ ) have been synthesised. Various physical properties, including mass spectra,  $^1H$  and  $^{13}C$  NMR spectra, are reported.

### Introduction

As part of a study on organotin compounds in the environment, we had need to prepare tetraorganotin compounds to use as standards and/or derivatives for analyses by GLC. In this paper, we report on the syntheses and some physical data for unsymmetric tetraorganotin compounds of the types,  $R_nR_{4-n}Sn$  and  $R_2R^1R^2Sn$ .

### Experimental

*Apparatus.* The gas chromatographs used were a Perkin–Elmer Model F-33 GC, equipped with a flame ionization detector (F.I.D.) and a  $7\text{ m} \times 0.33\text{ mm}$  ID BP-1 glass capillary column, and a Shimadzu Model GC-8A, equipped with a flame photometric detector (F.P.D.) (610 nm filter) and a  $12\text{ m} \times 0.53\text{ mm}$  ID BP-1 glass capillary column. The tin analyses were carried out on a Pye Unicam Model SP-9 Atomic Absorption Spectrometer using a published procedure [1].

$^1H$  NMR spectra were obtained on a Perkin–Elmer R34 spectrometer operating at 220 MHz while a Varian CFT-20 Spectrometer was used for  $^{13}C$  NMR spectra. Mass spectra were recorded on an AEI-Kratos M30 instrument.

Column chromatography was conducted on a  $60\text{ cm} \times 4\text{ cm}$  ID column of 5% water-deactivated Florisil (Aldrich).

*Materials.* Tetramethyltin (99% purity), tetrabutyltin (98%), tributyltin chloride (95%), dibutyltin dichloride (97%), butyltin trichloride (95%), dimethyltin dichloride

(95%), and diphenyltin dichloride (96%) were purchased from Aldrich. Tributyltin chloride and butyltin trichloride were fractional distilled under reduced pressure and dimethyltin dichloride was recrystallised from hexane before use.

Diethyl ether was dried over sodium and distilled prior to use.

#### *Synthesis of tetraorganotin compounds*

The compounds,  $\text{MeBu}_3\text{Sn}$ ,  $\text{Me}_2\text{Bu}_2\text{Sn}$ ,  $\text{Me}_3\text{BuSn}$ ,  $\text{Bu}_3\text{PeSn}$ ,  $\text{Bu}_2\text{Pe}_2\text{Sn}$  and  $\text{BuPe}_3\text{Sn}$  (Pe = pentyl) were obtained from the appropriate  $\text{Bu}_n\text{SnCl}_{4-n}$  and an excess of the alkyl-Grignard reagent in  $\text{Et}_2\text{O}$ .  $\text{Me}_2\text{Pe}_2\text{Sn}$  and  $\text{Pe}_4\text{Sn}$  were prepared by the reaction of the pentyl-Grignard reagent (from  $\text{PeBr}$ ) with  $\text{Me}_2\text{SnCl}_2$  and  $\text{SnI}_4$  respectively.

*General Grignard procedure.* The solution of the alkyl halide in  $\text{Et}_2\text{O}$  was added dropwise with stirring to a slight excess of Mg. After the addition was complete, the mixture was stirred for 15 min, before the solution of the organotin halide in  $\text{Et}_2\text{O}$  was added. The mixture was stirred for 1 h, and then treated with 10% aq.  $\text{NH}_4\text{Cl}$ . The organic layer was separated and the aqueous layer extracted twice with  $\text{Et}_2\text{O}$ . The combined organic layers were collected and dried over  $\text{MgSO}_4$ , and the solvent was removed to leave a residue. The products were purified by passage through the Fluorisil column with hexane as eluant; appropriate fractions (10 ml) were pooled and the solvent removed. Further purification of  $\text{BuPe}_3\text{Sn}$ ,  $\text{Me}_2\text{Pe}_2\text{Sn}$ , and  $\text{Pe}_4\text{Sn}$  was achieved by fractional distillation under reduced pressure.

#### *Preparation of butyldimethylpentyltin from dimethyltin dichloride*

Treatment of  $\text{Me}_2\text{SnCl}_2$  (0.09 mol) in  $\text{Et}_2\text{O}$  (50 ml) with the Grignard reagent made from  $\text{PhI}$  (0.20 mol) provided  $\text{Me}_2\text{Ph}_2\text{Sn}$ ; the crude product was chromatographed on the Florisil column and then distilled under reduced pressure. Iodine was added in small portions with stirring to a solution of  $\text{Me}_2\text{Ph}_2\text{Sn}$  (0.05 mol) in hexane at room temperature, the reaction being followed by GLC-FID. Addition of iodine was stopped when less than 0.5% of the  $\text{Me}_2\text{Ph}_2\text{Sn}$  remained; at this stage  $\text{Me}_2\text{SnI}_2$  was beginning to be formed. The solution was filtered through anhydrous  $\text{Na}_2\text{SO}_4$ , the solvent removed, and the  $\text{Me}_2\text{PhSnI}$  purified by distillation under reduced pressure (B.p. 144–146 °C/12 torr;  $D_4^{20}$  1.73;  $n_D^{25}$  1.6240). (Anal. Found: Sn, 34.0%; calc: 33.7%).

A solution of  $\text{Me}_2\text{PhSnI}$  (0.025 mol) in  $\text{Et}_2\text{O}$  was treated with the Grignard reagent made from  $\text{BuBr}$  (0.03 mol). The product,  $\text{Me}_2\text{BuPhSn}$ , was purified by column chromatography and then by distillation. Treatment of  $\text{Me}_2\text{BuPhSn}$  (0.015 mol) in hexane with iodine (0.015 mol) gave  $\text{Me}_2\text{BuSnI}$  (b.p. 96–100 °C/12 torr). Distilled  $\text{Me}_2\text{BuSnI}$  (0.010 mol) was treated with the Grignard reagent made from  $\text{PeBr}$  (0.015 mol) to give  $\text{Me}_2\text{BuPeSn}$ , which was purified by column chromatography.

#### *Preparation of dibutylmethylpentyltin from dibutyltin dichloride*

The compound,  $\text{Bu}_2\text{Ph}_2\text{Sn}$ , obtained in 78% yield from  $\text{Bu}_2\text{SnCl}_2$  (0.04 mol) and  $\text{PhMgI}$  in  $\text{Et}_2\text{O}$  (from  $\text{PhI}$ , 0.09 mol), was treated with iodine in hexane until almost all the  $\text{Bu}_2\text{Ph}_2\text{Sn}$  had reacted, as shown by GC-FID. Fractional distillation of the mixture gave pure  $\text{Bu}_2\text{PhSnI}$  (b.p. 150–155 °C/12 torr;  $D_4^{20}$  1.77); treatment of  $\text{Bu}_2\text{PhSnI}$  (0.025 mol) with the pentyl-Grignard reagent from  $\text{PeBr}$  (0.03 mol) gave  $\text{Bu}_2\text{PePhSn}$  which was purified by column chromatography and then by distillation.

Table 1

Synthesised compounds: purity and analysis

Compound	Purity (%) by GLC-FID (GLC-FPD)	Sn analysis (Found (calc.) (%))
Me <sub>3</sub> BuSn	> 99.5 (98.2)	53.2 (53.7)
Me <sub>2</sub> Bu <sub>2</sub> Sn	97.4 (98.1)	45.6 (45.2)
MeBu <sub>3</sub> Sn	96.5 (96.4)	38.7 (38.9)
Bu <sub>3</sub> PeSn	96.7 (94.5)	32.9 (32.9)
Bu <sub>2</sub> Pe <sub>2</sub> Sn	95.7 (> 99.5)	31.3 (31.7)
BuPe <sub>3</sub> Sn	95.6 (97.9)	30.6 (30.5)
Pe <sub>4</sub> Sn	97.0 (99.1)	29.5 (29.5)
Me <sub>2</sub> Pe <sub>2</sub> Sn	> 99.5 (> 99.5)	40.8 (40.8)
Me <sub>2</sub> BuPeSn	96.1 (96.5)	42.6 (42.9)
MeBu <sub>2</sub> PeSn	97.6 (> 99.5)	37.2 (37.3)
MeBuPe <sub>2</sub> Sn	94.0 (93.8)	35.6 (35.2)
Me <sub>2</sub> BuPhSn	96.2 (99.1)	41.6 (42.0)
Bu <sub>2</sub> PePhSn	93.4 (97.5)	31.7 (31.2)
BuPe <sub>2</sub> PhSn	93.4 (92.8)	29.6 (30.0)
Pe <sub>2</sub> Ph <sub>2</sub> Sn	99.2 (97.7)	28.5 (28.6)

Reaction of Bu<sub>2</sub>PePhSn (0.010 mol) in CCl<sub>4</sub> with iodine (1 equiv.) gave Bu<sub>2</sub>PeSnI (b.p. 172–174 °C/12 torr;  $D_4^{20}$  1.52;  $n_D^{25}$  1.5345; Anal. Found: Sn, 27.9; calc: 27.6%). Redistilled Bu<sub>2</sub>PeSnI (0.075 mol) was treated with the Grignard reagent, made from MeI (0.01 mol) in Et<sub>2</sub>O, to give MeBu<sub>2</sub>PeSn, which was purified by fractional distillation under reduced pressure.

#### *Preparation of butylmethyldipentyltin from diphenyltin dichloride*

The compound Pe<sub>2</sub>Ph<sub>2</sub>Sn was obtained from Ph<sub>2</sub>SnCl<sub>2</sub> (0.03 mol) in Et<sub>2</sub>O and the reagent made from PeBr (0.07 mol); purification was achieved by column chromatography on Fluorisil. Treatment of Pe<sub>2</sub>Ph<sub>2</sub>Sn (0.025 mol) in hexane with iodine (1 equiv.), initially at room temperature and then under reflux, gave Pe<sub>2</sub>PhSnI (b.p. 190–200 °C/12 torr). Reaction of Pe<sub>2</sub>PhSnI (0.020 mol) in Et<sub>2</sub>O with BuMgBr made from BuBr (0.025 mol) provided Pe<sub>2</sub>SnPhBu, which was purified by column chromatography on Fluorisil, and then by fractional distillation under reduced pressure. Iodine and BuPe<sub>2</sub>PhSn (both 0.021 mol) in hexane at room temperature gave BuPe<sub>2</sub>SnI (b.p. 177–180 °C/12 torr); BuPe<sub>2</sub>SnI (0.0075 mol) was treated with MeMgI made from MeI (0.01 mol) in Et<sub>2</sub>O to give MeBuPe<sub>2</sub>Sn, which was column chromatographed and then fractionally distilled under reduced pressure.

The purity of all compounds were checked by both GLC-FID and GLC-FPD. Analytical and purity data of the prepared tetraorganotin compounds are listed in Table 1. Mass spectral data are given in Table 2. NMR spectral and other physical data are given in Tables 3 and 4.

## Results and discussion

Series of Me<sub>4-n</sub>Sn and Bu<sub>n</sub>Pe<sub>4-n</sub>Sn were prepared by appropriate alkylations of Bu<sub>n</sub>SnCl<sub>4-n</sub> [3] with Grignard reagents. For other tetra-organotin compounds, use was made of sequences involving both Grignard alkylations of organotin halides

and iodine cleavage of phenyl-tin bonds [4] as illustrated by the syntheses of  $\text{Me}_2\text{BuPeSn}$ ,  $\text{MeBu}_2\text{PeSn}$  and  $\text{MeBuPe}_2\text{Sn}$  depicted in Schemes 1–3.

Scheme 1. Reagents: (i) 2PhMgI,  $\text{Et}_2\text{O}$ ; (ii)  $\text{I}_2$ , hexane; (iii) BuMgBr,  $\text{Et}_2\text{O}$ ; (iv) PeMgBr,  $\text{Et}_2\text{O}$ .

Scheme 2. Reagents: (i) 2PhMgI,  $\text{Et}_2\text{O}$ ; (ii)  $\text{I}_2$ , hexane; (iii) PeMgBr,  $\text{Et}_2\text{O}$ ; (iv)  $\text{I}_2$ ,  $\text{CCl}_4$ ; (v) MeMgI,  $\text{Et}_2\text{O}$ .

Scheme 3. (i) PeMgBr,  $\text{Et}_2\text{O}$ ; (ii)  $\text{I}_2$ , hexane; (iii) BuMgBr,  $\text{Et}_2\text{O}$ ; (iv) MeMgI,  $\text{Et}_2\text{O}$ .

Products were purified by column chromatography on Fluorisil and/or fractional distillation under reduced pressure. The purity of each product was checked by both GLC-FID and GLC-FPD and was usually > 95%. The GLC retention time data will be reported separately.

The mass spectra at 20 eV of the products clearly showed that scrambling of organic groups had not occurred in the preparation (or during the MS) of mixed alkyl compounds,  $\text{R}_n\text{R}_{4-n}^1\text{Sn}$  or  $\text{R}_2\text{R}^1\text{R}^2\text{Sn}$ . In no case was the molecular ion observed in the mass spectrum, the heaviest mass ions always being triorganotin ions. For mixed tetraorganotin species,  $\text{R}_n\text{R}_{4-n}^1\text{Sn}$  and  $\text{R}_2\text{R}^1\text{R}^2\text{Sn}$ , all possible triorganotin ions were observed. It was established that the facility to lose an organic group to give a triorganotin ion was in the sequence  $\text{Pe} = \text{Bu} > \text{Me} \approx \text{Ph}$ ; the loss of Pe and Bu groups is almost equally easy in the compounds containing both groups. From the intensities of the various trialkyltin ions, and taking into account statistical factors, the relative ease of losing the alkyl groups Me, Bu, and Pe in the mass spectra of  $\text{Me}_2\text{BuPeSn}$ ,  $\text{MeBu}_2\text{PeSn}$  and  $\text{MeBuPe}_2\text{Sn}$  can be seen to be 6/36/37, 4/31/32, and 6/42/38 respectively. Kochi and co-workers quote the relative ease of loss of Me and Bu groups to be 1/8 [6], in keeping with our data. From the mass spectra of  $\text{BuPe}_2\text{PhSn}$  and  $\text{Bu}_2\text{PePhSn}$ , similar considerations indicate the relative ease of loss of Bu, Pe, and Ph to be 30/29/5 and 29/28/12 respectively. For  $\text{Me}_2\text{BuPhSn}$ , the relative ease of loss of Me, Bu, and Ph is estimated to be 8/100/8.

In addition to triorganotin ions, other ions observed in the mass spectra were di- and mono-organotin ions arising from further loss of alkyl groups. Furthermore, for butyl- and pentyl-containing tetraorganotins, hydride ions,  $\text{R}_2\text{SnH}^+$  (or  $\text{RR}^1\text{SnH}^+$ ) and  $\text{RSnH}_2^+$  (by loss of an alkene fragment) were also observed.

In the  $^1\text{H}$  NMR spectra of tetraalkyltins in  $\text{CDCl}_3$  at 220 MHz, it was possible to distinguish chemical shifts for  $\text{H}_\alpha$ ,  $\text{H}_\beta$ ,  $\text{H}_\gamma$  and  $\text{H}_\delta$  of the butyl-tin group (viz.  $\delta$ : 0.75–0.88; 1.44–1.50; 1.26–1.31 and 0.84–0.90) respectively and for  $\text{H}_\alpha$ ,  $\text{H}_\beta$ , ( $\text{H}_\gamma + \text{H}_\delta$ ) and  $\text{H}_\epsilon$  of the pentyl-tin groups (viz.  $\delta$ : 0.76–0.82; 1.46–1.50; 1.26–1.31 and 0.85–0.90). For phenyltrialkyltins and diphenylalkyltins,  $\delta(\text{H}_\alpha)$  values (for both butyl and pentyl groups) shift to 1.03–1.07 and 1.26 respectively. Coupling constants,  $J(^{119}\text{Sn}-^1\text{H})$  were ca. 51 Hz for Me-Sn and ca. 48 Hz for Bu-Sn and Pe-Sn in tetraalkyltins. Phenyl substitution slightly increases these  $J$  values (by 2 Hz).

In the  $^{13}\text{C}$  NMR (20 MHz) spectra in  $\text{CDCl}_3$ , it can be seen that for the series  $\text{Me}_n\text{Bu}_{4-n}\text{Sn}$ ,  $\delta(\text{Me})$  and  $\delta(\text{C}_\alpha)$  of the butyl group are increasingly shifted to lower field as  $n$  increases.

For the series,  $\text{Bu}_n\text{Pe}_{4-n}\text{Sn}$ , there is a consistency in the chemical shift values for  $\text{C}_\alpha$ ,  $\text{C}_\beta$ ,  $\text{C}_\gamma$  and  $\text{C}_\delta$  for Bu (8.94, 29.47, 27.58 and 13.78), respectively, and for  $\text{C}_\alpha$ ,  $\text{C}_\beta$ ,  $\text{C}_\gamma$ ,  $\text{C}_\delta$  and  $\text{C}_\epsilon$  for Pe (9.16, 26.78, 38.86, 22.39 and 14.11, respectively). The coupling constants  $J(^{119}\text{Sn}-^1\text{H})$  were ca. 315, 20, 50 and 0 for  $^1J$ ,  $^2J$ ,  $^3J$ , and  $^4J$  respectively. Another observation was that successive phenyl substitution for alkyl groups in the tetraorganotins led to progressive shifts to higher field for both  $\delta(\text{C}_\alpha)$  (of butyl and pentyl groups) and  $\delta(\text{Me})$ .
