## Abstract

Ketonyl complexes [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COR)Cl][η<sup>2</sup>-pap = 2-(phenylazo)phenyl-C<sup>1</sup>,N<sup>2'</sup>] react i) with various salts [AgAc, Ac = MeCO<sub>2</sub>, or NaI] to give neutral complexes [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)X] [X = Ac (1), I (2)], ii) with PPh<sub>3</sub> to give [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COR)Cl(PPh<sub>3</sub>)] (R = Me (3), C<sub>6</sub>H<sub>2</sub>(OMe)<sub>3-3,4,5</sub> (4)), iii) with PPh<sub>3</sub> and KCN to give [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)CN(PPh<sub>3</sub>)] (5), iv) with Ph<sub>2</sub>P(CH<sub>2</sub>)<sub>2</sub>PPh<sub>2</sub> (dppe) (1:1) to give [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)(μ-dppe)]<sub>2</sub> Cl<sub>2</sub> (6a) which in turn reacts with NaClO<sub>4</sub> to give [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)(μ-dppe)]<sub>2</sub> (ClO<sub>4</sub>)<sub>2</sub> (6b), v) with PhNH<sub>2</sub> to give [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>C(=NPh)Me)Cl] (7), or vi) with AgClO<sub>4</sub> or Ag(CF<sub>3</sub>SO<sub>3</sub>) to give [Au(η<sup>2</sup>-pap)(η<sup>2</sup>-CH<sub>2</sub>COMe)X] [X = ClO<sub>4</sub> (8a), CF<sub>3</sub>SO<sub>3</sub> (8b)]. The complex [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)Cl(PPh<sub>3</sub>)] shows dynamic behaviour in solution. Low-temperature crystal structures have been determined for complexes 3 and 4. 3 crystallizes in the triclinic space group *P* $\bar{1}$  with *a* = 10.389(3), *b* = 11.269(3), *c* = 14.482(3),  $\alpha$  = 89.20(2),  $\beta$  = 72.95(2),  $\gamma$  = 63.43(2)°, *U* = 1436.0 Å<sup>3</sup>, *Z* = 2, 4399 observed reflections [*F* > 4.0σ(*F*)], *R* = 4.6%, and *wR* = 5.7%. Complex 4 crystallizes in the monoclinic space group *P*2<sub>1</sub> with *a* = 11.151(3) Å, *b* = 18.468(5) Å, *c* = 17.780(3) Å,  $\beta$  = 92.11(2)°, *U* = 3659.2(15) Å<sup>3</sup>, *Z* = 4, 9657 observed reflections [*F* > 4.0σ(*F*)], *R* = 2.62%, and *wR* = 2.61%. Both complexes show a square-planar coordination around the gold atom with chloride *trans* to aryl. The ketonyl group is unambiguously bonded through the carbon atom in complex 4, but may be disordered in complex 3.

## 1. Introduction

Metallated ketones play a very important role in organic synthesis [1]. They can be prepared by direct metallation of the ketone, oxidation-addition reactions (with α-halogenocarbonyl compounds or epoxides), or transmetallation reactions, *etc.* [1,2]. We have recently reported that an unusual [3] C–H activation of acetone occurs by intramolecular co-operation between the metal [Au<sup>III</sup>] and a ligand attached to it [4]. Thus, [Au(η<sup>2</sup>-pap)Cl<sub>2</sub>][η<sup>2</sup>-pap = 2-(phenylazo)phenyl-C<sup>1</sup>,N<sup>2'</sup>] when treated in acetone with various reagents such as Tl(acac) (Hacac = acetylacetone), KCN, AgClO<sub>4</sub>, 1,10-phenanthroline, [HgR<sub>2</sub>] (R = C<sub>6</sub>F<sub>5</sub>, pap), [PdR<sub>2</sub>] (R = C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>-2), gives [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-

CH<sub>2</sub>COMe)Cl]. Some intermediates in this process (see Scheme 1) were isolated. We have also studied the C–H activation of other ketones [5]. We now report the study of the reactivity of the new ketonyl complexes and X-ray structural studies of some phosphine derivatives.

## 2. Results

The complex [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)Cl] [η<sup>2</sup>-pap = 2-(phenylazo)phenyl-C<sup>1</sup>,N<sup>2'</sup>], obtained by C–H activation of acetone (see Scheme 1) [4], reacts with AgAc (Ac = MeCO<sub>2</sub>) in equimolar proportions, or with an excess of NaI, to give the corresponding substitution products [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COMe)X] [X = Ac (1) or I (2)] (see Scheme 2).

PPh<sub>3</sub> reacts readily with ketonyl complexes [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COR)Cl] to give the corresponding

Scheme 1. Proposed reaction pathway for the carbon-hydrogen activation process of ketones with 2-(phenylazo)phenylgold(III) complexes, CN = C<sub>6</sub>H<sub>4</sub>N<sub>2</sub>Ph-2: (i) X = acac-C, CN, C<sub>6</sub>H<sub>4</sub>N<sub>2</sub>Ph-2, C<sub>6</sub>F<sub>5</sub>, or C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>-2; (ii) + Me<sub>2</sub>CO; (iii) - XH.

adducts [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COR)Cl(PPh<sub>3</sub>)] [R = Me (3) or R = C<sub>6</sub>H<sub>2</sub>(OMe)<sub>3</sub>-3,4,5(tmp) (4)]. The related species [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)CN(PPh<sub>3</sub>)] (5) was prepared to compare its solution behaviour with that of 3 (see below) by adding PPh<sub>3</sub> (1:1) and then, after 30 min, KCN (1:1:5), to [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)Cl].

1,2-bis(diphenylphosphino)ethane (dppe) reacts with [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)Cl] (1:1) to give [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)(μ-dppe)]<sub>2</sub>Cl<sub>2</sub> (6a), which in turn reacts with NaClO<sub>4</sub> (1:1) to give [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)(μ-dppe)]<sub>2</sub>(ClO<sub>4</sub>)<sub>2</sub> (6b).

Reaction of [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)Cl] with PhNH<sub>2</sub> yields the imine complex [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>C(=NPh)Me)Cl] (7). [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>CO-Me)(Ac)] reacts with aqueous HClO<sub>4</sub> to give [Au(η<sup>2</sup>-pap)(η<sup>2</sup>-CH<sub>2</sub>COME)]ClO<sub>4</sub> (8a) and with (pyH)ClO<sub>4</sub> (py = pyridine) to give the known complex [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)(py)]ClO<sub>4</sub> [5]. An alternative preparation of 8a is the reaction between [Au(η<sup>1</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)(bipy)]ClO<sub>4</sub> [5] (bipy = 2,2'-bipyridine) and AgClO<sub>4</sub>. However, the most direct method consists in reaction of [Au(η<sup>2</sup>-pap)Cl<sub>2</sub>] with AgClO<sub>4</sub> (1:2) in acetone. In this way, [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)Cl] is formed at first [4,5], and then reacts with AgClO<sub>4</sub> to give 8a. Because 8a is too unstable in solution to yield a <sup>1</sup>H NMR spectrum, we isolated [Au(η<sup>2</sup>-pap)(η<sup>2</sup>-CH<sub>2</sub>COME)]CF<sub>3</sub>SO<sub>3</sub> (8b), which is slightly more stable in solution, by reaction of [Au(η<sup>2</sup>-pap)(η<sup>1</sup>-CH<sub>2</sub>COME)Cl] with AgCF<sub>3</sub>SO<sub>3</sub>.

### 3. Discussion

The reactions between the ketonylgold(III) complexes and PPh<sub>3</sub> are fast and are accompanied by a change from yellow to orange-red, presumably due to the change of coordination of the aryl ligand from di- to mono-hapto (see Scheme 2). This behaviour is similar to that found for [Au(η<sup>2</sup>-pap)Cl<sub>2</sub>] [6]. [Au(η<sup>2</sup>-

Scheme 2. Synthesis of complexes 1-8: (i) + AgAc - AgCl or + NaI - NaCl; (ii) + PPh<sub>3</sub>; (iii) + PPh<sub>3</sub> + KCN - KCl; (iv) + dppe or + dppe + NaClO<sub>4</sub>; (v) + PhNH<sub>2</sub> - H<sub>2</sub>O; (vi) + AgX - AgCl; (vii) + HClO<sub>4</sub> - HAc; (ix) + 2 AgClO<sub>4</sub> + Me<sub>2</sub>CO - 2 AgCl - HClO<sub>4</sub>.

pap)( $\eta^1$ -CH<sub>2</sub>COMe)Cl] also resembles [Au( $\eta^2$ -pap)Cl<sub>2</sub>] in its reactions with some more labile donors, such as AsPh<sub>3</sub>, SbPh<sub>3</sub> and pyridine because, although the same colour change in solution was observed, the starting products were recovered unchanged, probably because of an equilibrium between the starting complex and the neutral adducts [6].

The reaction between [Au( $\eta^2$ -pap)( $\eta^1$ -CH<sub>2</sub>COMe)Cl] and dppe leads to the dimer **6a** even using a 2:1 ratio. In this case, a mixture of **6a** and the starting gold(III) complex was obtained. This result contrasts with that previously described [6] for [Au( $\eta^2$ -pap)Cl<sub>2</sub>], which, upon reaction with dppe (2:1 or 1:1), gave the neutral dimer with a bridging diphosphine, *cis*-[Au<sub>2</sub>( $\eta^1$ -pap)<sub>2</sub>Cl<sub>4</sub>( $\mu$ -dppe)].

The condensation reaction giving complex **7** occurs under very mild conditions which contrasts with the fact that ketones add primary amines only at high temperatures [7]. The difference may be attributed to the increase in electrophilic character of the carbonyl carbon atom on substitution of a hydrogen in acetone by the Cl(pap)Au<sup>III</sup> moiety.

### 3.1. Structure and spectroscopic properties of the complexes

A strong absorption corresponding to  $\nu$ (CO) appears at *ca.* 1675 cm<sup>-1</sup> in the ketonyl complexes 1–6. In the cationic chelating ketonyls **8** this band shifts to *ca.* 1580 cm<sup>-1</sup> as a result of the coordination of the carbonyl oxygen to the metal. Complex **1** shows two strong absorptions at *ca.* 1625 and 1300 cm<sup>-1</sup> due to  $\nu_{\text{asym}}$ (CO<sub>2</sub>) and  $\nu_{\text{sym}}$ (CO<sub>2</sub>), respectively, of the acetate. Complex **7** shows  $\nu$ (CN) as a medium band at 1620 cm<sup>-1</sup>. The  $\nu$ (AuCl) band appears around 300 cm<sup>-1</sup> in chloro-complexes **3**, **4** and **7**, indicating that the chloro ligands are *trans* to the phenyl group, consistent with the X-ray structure of **3** and **4** (see below) and other related complexes [4].

The <sup>1</sup>H NMR spectra of ketonyl complexes **1** and **2** show CH<sub>2</sub> resonances as a singlet in the range 3.2–3.8 ppm, consistent with the coordination of the ketonyl group through the CH<sub>2</sub> carbon atom [4,5]. Complexes **8a,b** rapidly decompose in solution and only the <sup>1</sup>H NMR spectrum of **8b** could be recorded, showing a singlet at 3.5 ppm. Complexes **3** and **4** show the CH<sub>2</sub> resonance as a broad peak and a singlet, respectively, indicating dynamic behaviour in solution, while **5** shows a doublet at 3.2 ppm (<sup>3</sup>J(HP) = 14.7 Hz).

A conductivity study of complex **6b** in nitromethane gives the values expected for a 1:2 electrolyte [8]. The *cis* geometry is based on the <sup>31</sup>P NMR spectrum.

As far as we are aware, **7**, **8a,b** are the only complexes containing a dihapto-acetonyl and a monohapto CH<sub>2</sub>C(=NPh)Me ligand. In the complex [W( $\eta^5$ -

Cp)(CO)<sub>2</sub>( $\eta^3$ -CH<sub>2</sub>COMe)], the acetonyl is assumed to be coordinated as  $\eta^3$ -oxaallyl [2a].

An interesting feature of the phosphine complex **3** is that it undergoes slow spontaneous reductive elimination to give [AuCl(PPh<sub>3</sub>)] and the coupling product pap-CH<sub>2</sub>COMe. The synthesis and characterization of these new C–C coupling derivatives are currently under study. We have recently described [9] a family of substituted biphenyls, Ar–Ar', prepared by reaction of complexes [Au(Ar)(Ar')Cl] with PPh<sub>3</sub>.

The X-ray diffraction studies of complexes **3** and **4** (see Tables 1 and 2, Figs. 1 and 2) reveal the expected square-planar geometry at the metal atom, with the ketonyl groups *trans* to the phosphine (as indicated by the IR and low-temperature NMR data). The ketonyl group in **3** displayed relatively high displacement parameters for a low-temperature structure (*ca.* 0.1 Å<sup>2</sup>), and the hydrogen atoms were not located. However, no such problems were encountered in the structure of **4**, where the hydrogen atoms were all located and the coordination of the ketonyl group through the carbon atom thus confirmed.

The two independent molecules of **4** display similar molecular dimensions, the main difference being in the Au–Cl bond lengths of 2.372, 2.382(1) Å. These values are similar to that of **3** [2.368(3) Å], but surprisingly, much longer than the 2.347(1) Å observed *trans* to the aryl in [Au( $\eta^2$ -mpap)Cl<sub>2</sub>] [5] [ $\eta^2$ -mpap = 2-(4'-methylphenylazo)-5-methylphenyl-C<sup>1</sup>,N<sup>2</sup>]. This may be due to a larger *cis* influence of ketonyl and phosphine ligands compared with chloro and azo-N, but *cis* influences in gold complexes have not been studied in any detail.

The Au–C(aryl) bond lengths in **3**, **4**, [Au( $\eta^2$ -mpap)Cl<sub>2</sub>], and [Au( $\eta^2$ -mpap)( $\eta^1$ -CH<sub>2</sub>COMe)(py)]-ClO<sub>4</sub> [5] are very similar [range 2.011(5)–2.033(11) Å], despite the different *trans* ligands (Cl in the first three complexes, acetonyl C in the latter).

The C(ketonyl)–Au bonds in **4** [2.100, 2.114(6) Å] are longer than in [Au( $\eta^2$ -mpap)( $\eta^1$ -CH<sub>2</sub>COMe)(py)]-

$\text{ClO}_4$  [2.061(6) Å], [5] because the *trans* ligand in the latter is an azo-N atom. Other bond lengths of the ketonyl in both compounds are similar, and are consistent with C–metal bonding [e.g. C=O 1.217(7)–1.229(7), C–CH<sub>2</sub> 1.481(7)–1.487(9) Å]. The bond lengths of the ketonyl in **3** do not fit this pattern because C=O is 1.35(3) and C–CH<sub>2</sub> is 1.28(3) Å; the structure of **3** is in any case imprecise, and a static disorder involving superposition of *O*- and *C*-bonded ketonyl cannot be ruled out.

#### 4. Experimental section

The IR spectra, the C, H, N and Au analyses, conductance measurements, melting point determina-

tions, NMR spectra and general reaction conditions were as described elsewhere [10]. The starting complexes  $[\text{Au}(\text{pap})(\text{CH}_2\text{COR})\text{Cl}]$  and  $[\text{Au}(\eta^1\text{-pap})(\eta^1\text{-CH}_2\text{COMe})(\text{bipy})]\text{ClO}_4$  [4,5] were prepared as reported.

#### 4.1. $[\text{Au}(\eta^2\text{-pap})(\eta^1\text{-CH}_2\text{COMe})\text{X}]$ [*X* = Ac (**1**) or I (**2**)]

To an acetone solution of  $[\text{Au}(\eta^2\text{-pap})(\text{CH}_2\text{COMe})\text{Cl}]$  (0.1 mmol) solid AgAc (0.1 mmol), or NaI (0.3 mmol) was added and the suspension stirred for 5 h or 5 min respectively. The solvent was removed to dryness and the residue extracted with  $\text{CH}_2\text{Cl}_2$  and filtered through  $\text{MgSO}_4$ . The solution was concentrated (1 cm<sup>3</sup>), whereupon addition of  $\text{Et}_2\text{O}$ /hexane (10 cm<sup>3</sup>) and recrystallization from  $\text{Et}_2\text{O}$ /hexane gave the complexes as yellow solids. Yields: 70 (**1**); 79 (**2**)%. M.p. (°C): 148 (**1**); 150 (decomp.) (**2**).  $\nu(\text{CO})$  (cm<sup>-1</sup>) 1670 (**1**), (**2**). <sup>1</sup>H NMR ( $\text{CDCl}_3$ ) (**1**):  $\delta$  7.7 (m, 9H, Ph), 3.2 (s, 2H, CH<sub>2</sub>); 2.3 (s, 3H, Me), 1.9 (s, 3H, Me(Ac)) ppm; <sup>1</sup>H NMR ( $\text{CDCl}_3$ ) (**2**):  $\delta$  7.6 (m, 9H, Ph), 3.8 (s, 2H, CH<sub>2</sub>), 2.4 (s, 3H, Me) ppm. <sup>13</sup>C NMR ( $\text{CDCl}_3$ ) (**1**):  $\delta$  207.4 (CO), 176.7 (CO<sub>2</sub>), 38.1 (CH<sub>2</sub>), 31.0 [Me(Ac)], 24.6 (Me) ppm. Anal. Calc. for C<sub>17</sub>H<sub>17</sub>AuN<sub>2</sub>O<sub>3</sub> (**1**): C, 41.3; H, 3.5; N, 5.7; Au, 39.8. Found: C, 41.4; H, 4.0; N, 5.9; Au, 39.1%. Anal. Calc. for C<sub>15</sub>H<sub>14</sub>AuIN<sub>2</sub> (**2**): C, 32.0; H, 2.5; N, 5.0; Au, 35.0. Found: C, 32.5; H, 2.8; N, 4.6; Au, 34.6%.

#### 4.2. $[\text{Au}(\eta^1\text{-pap})(\eta^1\text{-CH}_2\text{COR})\text{Cl}(\text{PPh}_3)]$ [*R* = Me (**3**) or *R* = *tmp* (**4**)]

To a  $\text{CH}_2\text{Cl}_2$  (15 cm<sup>3</sup>) solution of  $[\text{Au}(\text{pap})(\text{CH}_2\text{COMe})\text{Cl}]$  (0.1 mmol), solid  $\text{PPh}_3$  (0.1 mmol) was added and the resulting solution stirred for 1 h. The solution was concentrated (1 cm<sup>3</sup>) and hexane (5 cm<sup>3</sup>) added to

#### 4.3. X-ray structure determination of compound 3

##### 4.3.1. Crystal data

C<sub>33</sub>H<sub>29</sub>AuClN<sub>2</sub>OP, M = 733.0, triclinic, space group  $P\bar{1}$ ,  $a = 10.389(3)$ ,  $b = 11.269(3)$ ,  $c = 14.482(3)$  Å,  $\alpha = 89.20(2)$ ,  $\beta = 72.95(2)$ ,  $\gamma = 63.43(2)^\circ$ ,  $U = 1436.0$  Å<sup>3</sup>,  $Z = 2$ ,  $D_x = 1.695$  Mg m<sup>-3</sup>,  $\lambda(\text{Mo K}\alpha) = 0.71069$  Å,  $\mu = 5.3$  mm<sup>-1</sup>,  $T = 178$  K,  $F(000) = 720$ .

##### 4.3.2. Data collection and reduction

An orange tablet  $0.3 \times 0.35 \times 0.1$  mm was mounted in inert oil on a glass fibre and transferred to the cold

gas stream of the diffractometer (Siemens R3 with LT-2 low temperature attachment). Data were collected to  $2\theta_{\text{max}} = 50^\circ$  with monochromated Mo K $\alpha$  radiation. Cell constants were refined from diffractometer angles of 50 reflections in the  $2\theta$  range 20–23°. An absorption correction was applied (after isotropic refinement, see below) using the program DIFABS [11] with transmission factors 0.78–1.30. Of 5307 reflections, 5028 were unique ( $R_{\text{int}} 0.025$ ) and  $4399 > 4\sigma(F)$  used for all calculations (program system Siemens SHELXTL PLUS).

##### 4.3.3. Structure solution and refinement

The structure was solved by the heavy-atom method. Au, P, and Cl atoms were refined anisotropically. Hydrogen atoms were included using a riding model, except for those of the acetylonyl, which were not located. Refinement proceeded to  $R 0.046$ ,  $wR 0.057$ . The weighting scheme was  $w^{-1} = \sigma^2(F) + 0.0002F^2$ . 172 parameters;  $S 2.4$ ; max.  $\Delta/\sigma 0.007$ ; max.  $\Delta\rho 2.9 \times 10^{-6}$  e pm<sup>-3</sup>. Final atomic coordinates are given in Table 3.

#### 4.4. X-ray structure determination of compound 4

##### 4.4.1. Crystal data

C<sub>41</sub>H<sub>37</sub>AuClN<sub>2</sub>O<sub>4</sub>P, M = 885.1, monoclinic, space group  $P2_1$ ,  $a = 11.151(3)$ ,  $b = 18.468(5)$ ,  $c = 17.780(3)$  Å,  $\beta = 92.11(2)^\circ$ ,  $U = 3659.2$  Å<sup>3</sup>,  $Z = 4$ ,  $D_x = 1.607$  Mg m<sup>-3</sup>,  $\lambda(\text{Mo K}\alpha) = 0.71069$  Å,  $\mu = 4.2$  mm<sup>-1</sup>,  $T = 178$  K,  $F(000) = 1760$ .

#### 4.4.2. Data collection and reduction

As for **3**, with the following differences; orange prism  $0.25 \times 0.2 \times 0.2$  mm, absorption correction based on  $\psi$ -scans, with transmission factors 0.63–0.87. Of 11545 reflections, 10709 were unique ( $R_{\text{int}}$  0.020) and  $9657 > 4\sigma(F)$  used for all calculations.

#### 4.4.3. Structure solution and refinement

The structure was solved by the heavy-atom method. All non-H atoms were refined anisotropically. Hydrogen atoms were included using a riding model. The absolute structure was determined by an  $\eta$  refinement, with  $\eta = +1.022(8)$ . Refinement proceeded in two blocks (each independent molecule separately) to  $R$  0.026,  $wR$  0.026. The weighting scheme was  $w^{-1} = \sigma^2(F) + 0.0002F^2$ . 900 parameters (451 per block);  $S$  1.1; max.  $\Delta/\sigma$  0.011; max.  $\Delta\rho$   $1.6 \times 10^{-6}$  e  $\text{pm}^{-3}$ . Final atomic coordinates are given in Table 4.

#### 4.5. $[\text{Au}(\eta^1\text{-pap})(\eta^1\text{-CH}_2\text{COMe})\text{CN}(\text{PPh}_3)]$ (**5**)

To an acetone solution of  $[\text{Au}(\text{pap})(\text{CH}_2\text{COMe})\text{Cl}]$  (80 mg, 0.17 mmol), solid  $\text{PPh}_3$  (49 mg, 0.17 mmol) was added and after stirring for 30 min solid KCN (11 mg, 0.17 mmol) was added. After 52 h the solvent was removed to dryness and the residue extracted with  $\text{CH}_2\text{Cl}_2$ . Filtration through  $\text{MgSO}_4$ , concentration to 1  $\text{cm}^3$  and addition of hexane gave an orange solid. Yield: 65%. M.p.  $151^\circ\text{C}$ ;  $\nu(\text{CO})$   $1670 \text{ cm}^{-1}$ .  $^1\text{H NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.4 (m, 24H, Ph), 3.2 [d, 2H,  $\text{CH}_2$ ,  $^3J(\text{HP})$  14.7 Hz], 2.1 (s, 3H, Me) ppm.  $^{31}\text{P NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  29.9 ppm. Anal. Calc. for  $\text{C}_{34}\text{H}_{29}\text{AuN}_3\text{OP}$ : C, 56.4; H, 4.0; N, 5.8; Au, 27.2. Found: C, 57.1; H, 4.4; N, 6.0; Au, 27.3%.

#### 4.6. $[\text{Au}(\eta^1\text{-pap})(\eta^1\text{-CH}_2\text{COMe})(\mu\text{-dppe})_2\text{Cl}_2]$ (**6a**)

To an acetone solution of  $[\text{Au}(\eta^2\text{-pap})(\text{CH}_2\text{COMe})\text{Cl}]$  (34 mg, 0.07 mmol) solid dppe (29 mg, 0.07 mmol) was added and the solution stirred for 40 min. The solution was concentrated (1  $\text{cm}^3$ ) whereupon addition of  $\text{Et}_2\text{O}$  (5  $\text{cm}^3$ ) and recrystallization from  $\text{CH}_2\text{Cl}_2/\text{Et}_2\text{O}$  gave an orange solid **6a**. Yield: 85%. M.p.  $282^\circ\text{C}$ .  $\nu(\text{CO})$   $1665 \text{ cm}^{-1}$ .  $^1\text{H NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.5 (m, 29H, Ph), 3.0 [m, 6H,  $\text{CH}_2\text{CH}_2$  (dppe) +  $\text{AuCH}_2$ ], 1.3 (s, 3H, Me) ppm.  $^{31}\text{P NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  51.6, 48.6 ppm. Anal. Calc. for  $\text{C}_{82}\text{H}_{76}\text{Au}_2\text{Cl}_2\text{N}_3\text{O}_2\text{P}_4$ : C, 56.7; H, 4.4; N, 3.2; Au, 22.7. Found: C, 55.9; H, 4.6; N, 2.8; Au, 23.0%.

#### 4.7. $\{[\text{Au}(\eta^1\text{-pap})(\eta^1\text{-CH}_2\text{COMe})(\mu\text{-dppe})_2](\text{ClO}_4)_2\}$ (**6b**)

To an acetone solution of **6a** (50 mg, 0.06 mmol) solid  $\text{NaClO}_4 \cdot \text{H}_2\text{O}$  (8 mg, 0.06 mmol) was added and the solution stirred for 50 min. Concentration of the solution (1  $\text{cm}^3$ ) gave **6b** as an orange precipitate. Yield: 82%. M.p.  $130^\circ\text{C}$ ;  $\nu(\text{CO})$   $1665 \text{ cm}^{-1}$ .  $^1\text{H NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.0 (m, 29H, Ph), 3.0 [m, 6H,  $\text{CH}_2\text{CH}_2$  (dppe) +  $\text{AuCH}_2$ ], 1.3 (s, 3H, Me) ppm.  $^{31}\text{P NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  51.6, 48.0 ppm. Anal. Calc. for  $\text{C}_{82}\text{H}_{76}\text{Au}_2\text{Cl}_2\text{N}_3\text{O}_{10}\text{P}_4$ : C, 52.8; H, 4.1; N, 3.0; Au, 21.1. Found: C, 52.7; H, 4.6; N, 2.6; Au, 21.3%.

#### 4.8. $[\text{Au}(\eta^2\text{-pap})\{\eta^1\text{-CH}_2\text{C}(=\text{NPh})\text{Me}\}\text{Cl}]$ (**7**)

To a  $\text{CH}_2\text{Cl}_2$  solution of  $[\text{Au}(\eta^2\text{-pap})(\text{CH}_2\text{COMe})\text{Cl}]$  (50 mg, 0.11 mmol)  $\text{PhNH}_2$  (2  $\text{cm}^3$ ) was added and the mixture stirred over molecular sieves. After 1 h the solution was filtered through  $\text{MgSO}_4$ , the solvent evaporated to 1  $\text{cm}^3$  and hexane (5  $\text{cm}^3$ ) added to obtain a yellow solid that was recrystallized from  $\text{CH}_2\text{Cl}_2/\text{hexane}$ . Yield: 62%. M.p.  $123^\circ\text{C}$ .  $\nu(\text{CN})$   $1620 \text{ cm}^{-1}$ .  $^1\text{H NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.7 (m, 14H, Ph), 4.9 (s, 2H,  $\text{CH}_2$ ), 2.4 (s, 3H, Me) ppm. Anal. Calc. for  $\text{C}_{21}\text{H}_{19}\text{AuClN}_3$ : C, 46.2; H, 3.5; N, 7.7; Au, 36.1. Found: C, 45.6; H, 3.1; N, 7.4; Au, 36.8%.

4.9.  $[Au(\eta^2\text{-pap})(\eta^2\text{-CH}_2\text{COMe})]ClO_4$  (8a)

**Method a:** To an acetone solution of  $[Au(\eta^2\text{-pap})Cl_2]$  (40 mg, 0.09 mmol) solid  $AgClO_4$  (38 mg, 1.8 mmol) was added. After 30 min the solvent was removed to dryness and the residue extracted with  $CH_2Cl_2$  (15  $cm^3$ ), filtered through  $MgSO_4$  and the solution concentrated to 2  $cm^3$ . Addition of  $Et_2O$  (7  $cm^3$ ) and recrystallization from  $CH_2Cl_2/Et_2O$  gave 8a. Yield: 75%.

**Method b:** To an acetone solution of 1 (50 mg, 0.1 mmol) an excess of aqueous  $HClO_4$  (conc.) was added. After 1 h the solvent was evaporated to 1  $cm^3$  and  $Et_2O$  added to obtain a yellow solid. Yield: 50%.

**Method c:** To an acetone solution of  $[Au(\eta^1\text{-pap})(\eta^1\text{-CH}_2\text{COMe})(bipy)]ClO_4$  (50 mg, 0.07 mmol) solid  $AgClO_4$  (16 mg, 0.07 mmol) was added. After 15 min the suspension was filtered to obtain a white precipitate of  $Ag(bipy)ClO_4$  (by IR) and an orange solution.

Concentration to 5 cm<sup>3</sup> and addition of Et<sub>2</sub>O gave **8a**. Yield: 65%. M.p. 135°C (decomp.).  $\Lambda_M = 134 \Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}$  ( $2.5 \times 10^{-4} \text{ mol dm}^{-3}$  acetone).  $\nu(\text{CO})$  1580 cm<sup>-1</sup>. Anal. Calc. for C<sub>15</sub>H<sub>14</sub>AuClN<sub>2</sub>O<sub>5</sub>: C, 33.7; H, 2.6; N, 5.2; Au, 36.8. Found: C, 34.3; H, 2.7; N, 4.6; Au, 37.1%.

#### 4.10. [Au( $\eta^2$ -pap)( $\eta^2$ -CH<sub>2</sub>COMe)]CF<sub>3</sub>SO<sub>3</sub> (**8b**)

To an acetone solution of [Au( $\eta^2$ -pap)( $\eta^1$ -CH<sub>2</sub>COMe)Cl] (84 mg, 0.18 mmol) solid Ag(CF<sub>3</sub>SO<sub>3</sub>) (46 mg, 0.18 mmol) was added. After 1 h the solvent was evaporated (1 cm<sup>3</sup>). Addition of Et<sub>2</sub>O (10 cm<sup>3</sup>) gave **8b** as a yellow solid. Yield: 84%. M.p. 145°C.  $\Lambda_M = 115 \Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}$  ( $4.4 \times 10^{-4} \text{ mol dm}^{-3}$  acetone).  $\nu(\text{CO})$  1580 cm<sup>-1</sup>. <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  8.2 (d, 1H, Ph), 7.9 (m, 2H, Ph), 7.8 (d, 1H, Ph), 7.5 (m, 5H, Ph), 3.5 (s, 2H, CH<sub>2</sub>), 2.4 (s, 3H, Me) ppm. Anal. Calc. for C<sub>16</sub>H<sub>14</sub>AuF<sub>3</sub>N<sub>2</sub>O<sub>4</sub>S: C, 32.9; H, 2.4; N, 4.8; Au, 33.7. Found: C, 33.5; H, 2.7; N, 4.2; Au, 33.6%.

### 5. Supplementary materials available

Further details of the structure determinations (complete bond lengths and angles, H atom coordinates, structure factors, temperature factors) have been deposited at the Fachinformationszentrum Karlsruhe, Gesellschaft für Wissenschaftlich-technische Information mbH, W-7514 Eggenstein-Leopoldshafen 2, Germany. Any request for this material should quote a full literature citation and the reference number CSD-57304.

### Acknowledgments

We thank Dirección General de Investigación Científica y Técnica (PB89-0430) and the Fonds der Chemischen Industrie for financial support.
