

Pd-Si (Palladium-Silicon)

H. Okamoto

The Pd-Si phase diagram in [Massalski2] was assessed by [1989Cha]. The phase diagram was revised by [1993Mas], as reported by [1993Oka].

Figure 1 shows the Pd-Si phase diagram thermodynamically assessed by [2006Du] primarily based on the work of [1993Mas]. Figure 2 shows the detail of Fig. 1 from 10 to 25 at.% Si. Special points in these figures are summarized in Table 1.

Although the calculated phase diagram appears to be a good presentation of numerous experimental data points, the following points must be confirmed.

- Stability of $\alpha\text{Pd}_2\text{Si}$, $\text{Pd}_{39}\text{Si}_{20}$, and $\text{Pd}_{19}\text{Si}_{10}$: It is unlikely that two or more compounds with closely comparable compositions exist over a wide temperature range.
- Curvature of the $\text{Pd}_{21}\text{Si}_4/(\text{Pd}_{21}\text{Si}_4 + \text{Pd}_5\text{Si})$ phase boundary: A smooth extrapolation of this boundary to the low-temperature side appears to lead to a transition of Pd_5Si to $\text{Pd}_{21}\text{Si}_4$ on cooling, which is unlikely.

Table 2 summarizes Pd-Si crystal structure data given in [1989Cha] and [Pearson3].
