

*Disorder and Ionic Polarons in Solid Electrolytes.* W. J. PARDEE AND G. D. MAHAN. Physics Department, Indiana University, Bloomington, Indiana. The role of ion-ion repulsion and ion-phonon coupling in superionic conduction is explored. It is argued that the order-disorder phase transition is not associated with the conductivity discontinuity, but with a higher temperature second-order phase transition that has been seen in some super ionic conductors, and which we predict for others. The specific heat, ion distribution, and conductivity are calculated.

*X ray and Neutron Diffraction Study of Intermediate Phases in Nonstoichiometric Cerium Dioxide.* S. P. RAY AND A. S. NOWICK. Henry Krumb School of Mines, Columbia University, New York, New York 10027. AND D. E. COX, Physics Department, Brookhaven National Laboratory, Upton, New York 11973. Powder samples of reduced ceria  $\text{CeO}_{2-x}$  of known compositions in the range  $0 < x < 0.3$  have been examined by X ray and neutron diffraction techniques to determine which intermediate phases belonging to the homologous series  $\text{Ce}_n\text{O}_{2n-2}$  (with  $n = \text{integer}$ ) truly exist. Through the appearance of superlattice lines in the neutron diffraction patterns, the existence of four distinct phases, corresponding to  $n = 7, 9, 10,$  and  $11$  was established. Aside from the phase  $\text{Ce}_7\text{O}_{12}$ , the structures of these phases cannot be accounted for with rhombohedral cells based on  $\langle 111 \rangle$  vacancy strings, but indicate lower (monoclinic or triclinic) symmetry. The structure of  $\text{Ce}_9\text{O}_{16}$  and  $\text{Ce}_{10}\text{O}_{18}$  do not agree with structures proposed for the analogous  $\text{Pr}_n\text{O}_{2n-2}$  compounds.

*$^{125}\text{Te}$  Mossbauer Spectra of the Te(IV) Oxides and Oxyfluorides.* P. DOBUD AND C. H. W. JONES. Department of Chemistry, Simon Fraser University, Burnaby, B.C., Canada V5A 1S6. The  $^{125}\text{Te}$  Mossbauer spectra of a number of Te(IV) oxides are reported in which the tellurium is present in either a distorted trigonal bipyramidal or distorted tetrahedral coordination with the lone-pair occupying one of the coordinate positions. The isomer shifts and quadrupole splittings are interpreted in terms of the relative  $s$  and  $p$  character of the stereochemically active lone-pair. Mossbauer data for  $\text{KTeF}_5$ ,  $\text{K}_2\text{TeO}_2\text{F}_2$ ,  $\text{Cs}_2\text{TeO}_2\text{F}_2$ , and  $\text{Cs}_2\text{TeOF}_4$  are also presented and discussed.

*Structural Studies in the  $\text{Li}_2\text{MoO}_4$ - $\text{MoO}_3$  System. II. The High Temperature Form of Lithium Tetramolybdate,  $\text{H-Li}_2\text{Mo}_4\text{O}_{13}$ .* B. M. GATEHOUSE AND B. K. MISKIN. Chemistry Department, Monash University, Clayton, Victoria, Australia, 3168.  $\text{H-Li}_2\text{Mo}_4\text{O}_{13}$  crystallizes in the triclinic space group,  $\text{P}\bar{1}$ , with cell parameters  $a = 8.612 \text{ \AA}$ ,  $b = 11.562 \text{ \AA}$ ,  $c = 8.213 \text{ \AA}$ ,  $\alpha = 94.45^\circ$ ,  $\beta = 96.38^\circ$ ,  $\gamma = 111.24^\circ$ , and  $Z = 3$ . The structure was solved using three-dimensional Patterson and Fourier techniques. Of the 4403 unique reflections collected by counter methods, 2883 with  $I > 3\sigma(I)$  were used in the least-squares refinement of the model to a conventional  $R$  of 0.031 ( $R_w = 0.035$ ). Like  $\text{L-Li}_2\text{Mo}_4\text{O}_{13}$ ,  $\text{H-Li}_2\text{Mo}_4\text{O}_{13}$  is a derivative structure of  $\text{V}_6\text{O}_{13}$  and can be related to  $\text{L-Li}_2\text{Mo}_4\text{O}_{13}$  by movement of one of the shear planes in the structure.

*Neutron Diffraction Determination of the Crystal Structure of  $\text{Ce}_7\text{O}_{12}$ .* S. P. RAY. Henry Krumb School of Mines, Columbia University, New York, New York 10027. AND D. E. COX. Physics Department, Brookhaven National Laboratory, Upton, New York 11973. A neutron diffraction study has been made on polycrystalline and single-crystal samples of  $\text{CeO}_{1.714}$ . The results confirm that the compound is isostructural with ternary oxides of the type  $\text{UY}_6\text{O}_{12}$ . The space group is  $R\bar{3}$  with hexagonal unit cell dimensions  $a = 10.37$  and  $c = 9.67 \text{ \AA}$  (rhombohedral cell  $a = 6.80 \text{ \AA}$  and  $\alpha = 99.4^\circ$ ). The hexagonal unit cell contains three formula units of  $\text{Ce}_7\text{O}_{12}$ . Totals of 79 and 24 independent reflections from the single crystal were measured at neutron wavelengths of  $1.185 \text{ \AA}$  and  $2.37 \text{ \AA}$ , respectively. Simultaneous refinement of the two sets of data yielded a weighted  $R$  factor of 0.144. The structure is a rhombohedral defect type of fluorite arrangement in which pairs of oxygen vacancies are ordered along the  $[111]$  axis.

*Mechanism of the Solid State Synthesis of Cobalt Molybdate.* JERZY HABER, ANNA SOSNOWSKA, AND JACEK ZIOLKOWSKI. Research Laboratories of Catalysis and Surface Chemistry, Polish Academy of Sciences, Krakow, Poland. Mechanism and kinetics of the solid state reaction  $2\text{CoO} + 2\text{MoO}_3 + \text{Mo} = \text{Co}_2\text{Mo}_3\text{O}_8(1)$  was studied in the temperature range  $500$ - $1100^\circ\text{C}$  by chemical and X ray analysis. At three intergranular contacts existing in such powder mixture the following reactions proceed at comparable rates:  $2\text{MoO}_3 + \text{Mo} = 3\text{MoO}_2(2)$ ,  $\text{MoO}_3 + \text{CoO} = \text{CoMoO}_4(3)$ ,
