

Taken as a whole, the book is one of the best short manuals of blowpiping to be had. It will scarcely be adopted as a means for general qualitative analysis, but it is well worth the price asked, for use in the blowpipe laboratory or even as an adjunct to a qualitative course. It is well printed, well indexed and contains few errors.

CHARLES L. PARSONS.

---

**CORRECTION.**

In the paper by W. Geo. Waring on "The Volumetric Determination of Zinc," page 29, the factors for zinc ammonium phosphate and zinc pyrophosphate should be, respectively, 36.64 and 42.91 instead of 37.28 and 42.77, as given.
