

improved, and the various methods of stirring the electrolyte during the process of electrolysis so as to secure better and more rapid results have received special attention. The description of antiquated measuring instruments has happily been omitted. The descriptive parts contain much new matter, the electrolytic deposition and separation of the metals being detailed in the light of recent researches, to which references are given in considerable detail. About thirty-five pages are devoted to the analysis of technical products. The book represents a great improvement over previous editions. It is the best treatise on electrochemical analysis extant, and will be welcomed by analysts. The volume is neatly bound and well printed.
