

powder, fused vanadium pentoxide, iron filings, manganese dioxide, potassium nitrite or sodium fluoride in the carbon tetrachloride medium, the yields of potassium acid saccharate varied from 12 to 44%.

Oxidation of Glucose in Nitrogen Tetroxide Medium.—In a similar manner except for a 100-ml. round-bottom flask and 60 ml. of nitrogen tetroxide as solvent, a 25 to 44% yield of potassium acid saccharate was obtained by the oxidation of glucose (0.1 mole). A solution of urea was used to remove the last traces of the oxides of nitrogen. When 5 g. of potassium carbonate was added to the reaction mixture the yield of potassium acid saccharate, neut. equiv. 247.6, increased to 45%. When 5 g. of potassium carbonate was added to the reaction mixture at $35 \pm 0.2^\circ$, the yield of potassium acid saccharate, neut. equiv. 247.4, was 50%.

Treatment of Gluconic Acid and Its Lactone with Nitrogen Tetroxide.—D-Gluconolactone (0.05 mole) was dried over phosphorus pentoxide under a vacuum and then treated with nitrogen tetroxide (0.17 mole) in 150 ml. of carbon tetrachloride for 24 hours at $25 \pm 1^\circ$. The product was treated as was the glucose oxidation run to obtain 4.6 g. (37%) of potassium acid saccharate, neut. equiv. 246.5. Gluconic acid (0.1 mole) was dried in a vacuum over phosphorus pentoxide and treated with nitrogen tetroxide (0.35 mole) in 150 ml. of carbon tetrachloride for 9 hours at $25 \pm 1^\circ$. The product was treated as was the glucose oxidation run to obtain 8.39 g. (34%) of potassium acid saccharate, neut. equiv. 252.5. Gluconic acid (0.1 mole) was also treated with nitrogen tetroxide in a nitrogen tetroxide medium for 3 hours at $25 \pm 1^\circ$. The product was treated as was the glucose oxidation run to obtain 10.4 g. (42%) of potassium acid saccharate, neut. equiv. 248.2.

Treatment of Oxalic Acid with Nitrogen Tetroxide.—Anhydrous oxalic acid (0.05 mole) was treated with nitrogen tetroxide (0.17 mole) in carbon tetrachloride at a temperature of $25 \pm 1^\circ$ for 24 hours. After the period of oxidation, the excess nitrogen tetroxide was blown out and the water soluble component was extracted and transferred to a 250-ml. volumetric flask. To aliquots was added ammonium hydroxide to a pH of approximately 4. The calcium salt was precipitated out using calcium acetate. Following isolation and the dissolution of the calcium oxalate in sulfuric acid, the solution was titrated with standard potassium permanganate. The amount of oxalic acid found agreed within experimental error with that initially treated with nitrogen tetroxide.

Treatment of Potassium Acid Saccharate with Nitrogen Tetroxide.—Potassium acid saccharate (0.1 mole) and 6 ml. of glacial acetic acid were treated with nitrogen tetroxide (0.35 mole) in 150 ml. of carbon tetrachloride at $25 \pm 1^\circ$ for 8 hours. The product was treated to obtain 22.3 g. (90%) unreacted potassium acid saccharate, neut. equiv. 251.4. Potassium acid saccharate (0.1 mole) was also treated with nitrogen tetroxide in a nitrogen tetroxide medium for 3 hours at $25 \pm 1^\circ$. The product was treated to obtain 20.9 g. (84%) of potassium acid saccharate, neut. equiv. 249.3.

L-Rhamno-2,4-dinitrophenylhydrazone

BY JORGE ALEJANDRO DOMÍNGUEZ

In 1927 Glaser and Zuckermann¹ reported the preparation of glucose and galactose 2,4-dinitrophenylhydrazones. Subsequently, Allen² and Brady,³ unaware of this work, claimed that 2,4-dinitrophenylhydrazine did not give precipitates with the sugars.

L-Rhamno-2,4-dinitrophenylhydrazone.—Five ml. of glacial acetic acid and 0.3 g. of 2,4-dinitrophenylhydrazine were added to a solution of 1 g. of rhamnose in 5 ml. of water. This mixture was heated at 50° during 20 minutes, and allowed to stand at room temperature for 12 hours. The precipitated orange mass was collected, washed with water and a little cold alcohol, and recrystallized from hot alcohol.

- (3) O. L. Brady, *J. Chem. Soc.*, **1933**, 756 (1931).

The yield of the dry yellow crystals was 1.0 g. (71%) m. p. $164\text{--}165^\circ$ (uncor.). The melting point did not change after three recrystallizations.

Anal. Calcd. for $C_{12}H_{16}O_8N_4$: N, 16.27. Found: N, 16.18.

The "Exponential" Adsorption Isotherms of Fatty Acids on Activated Charcoal

BY E. GLUECKAUF

F. H. M. Nestler and H. G. Cassidy¹ have investigated the simultaneous adsorption of acetic, propionic and butyric acids on active charcoal from aqueous solution. They have tried to interpret these data by utilizing the binary exponential isotherm by Glueckauf² which should apply when the exponential form is caused by a statistical distribution of adsorbing centers of different affinity.^{2,3} However, they were able to obtain agreement with the observations only, by introducing an extra constant not provided by the theory. This note is intended to show that the exponential single-solute isotherms in this case need not be due to non-uniformity of the adsorbent, but can be caused by the strong affinity of activated charcoal for hydrogen ions, and that Nestler and Cassidy's binary adsorption data can be explained as an anion exchange process.

It has been shown by Steenberg⁴ that charcoal in a mixture of strong acids displays all the characteristics of an anion-exchanger, the primarily adsorbed group being the H_3O^+ ion. The chromatographically obtained data of Nestler and Cassidy fully support this view also for the weaker fatty acids, as the values obtained for the exchange factor k_3 are independent of the concentrations both for the pairs of acetic + propionic and propionic + butyric acids (see Table I). This feature is characteristic of exchange and of Langmuir isotherms, but is quite improbable for exponential ones.

TABLE I
ACETIC (1) AND PROPIONIC (2) ACID

$$k_3 = \frac{q_1 c_2}{c_1 q_2} = 1 - \frac{c_{1,1}(w_2 - w_1^q)}{c_1^q w_2} \quad (1)$$

$c_{1,1}$ and w_1^q = concentration and breakthrough volume of solute 1 (concentrations in wt. %). c_1^q = concentration of solute 1 at breakthrough of solute 2. w_2 = breakthrough volume of solute 2 (see ref. 1)

c_1^q	$c_{1,1}$	w_1	w_1^q	k_3
0.982	1.521	18.35	9.47	0.25
.759	1.145	22.35	11.05	(.24)
.752	1.153	22.75	11.79	.26
