

amine¹⁹ produced the silyl ether of cholesterol. Deprotection of the 3 β -hydroxyl group yielded cholesterol which was spectroscopically identical with an authentic sample (¹³C NMR, 360-MHz ¹H NMR, and IR).

The alkylideneoxirane **5** provided the complementary proof for our methodology. Addition of lithium methylocyanocuprate to **5** resulted in the formation of equal amounts of 1,4 and 1,2 adducts, **7**²⁰ and **8**,²¹ respectively. The unanticipated 1,2 adduct (**8**) can only be rationalized this time by the differences in the steric bulk of the alkylidene substituents (i.e., methyl vs. isohexyl). Comparison of the 360-MHz ¹H NMR spectra of the enantiomeric adducts **6** and **7** revealed a clear distinction in the absorptions for the respective C-21 methyl groups (0.97 for **6** and 1.11 for **7**). Intermediate **7** was then converted to the known isocholesterol²² by the same sequence of steps used for the preparation of cholesterol.

As a final check on the purity of the C-20 epimers produced in this study, we subjected the dimethyl ethyl silyl (DMES) ethers of compounds **6**, **7**, **9**, **10**, cholesterol, and isocholesterol to GC analysis.²³ While the retention times for the DMES ethers of **6** and **7** were very close, the ethers of compounds **9**, **10**, cholesterol, and isocholesterol separated well enough that it was possible to detect less than 1% epimeric contaminants. The GC analyses²⁴ confirmed that our synthetic products, **6**, **7**, **9**, **10**, cholesterol, and isocholesterol were >99.5% pure epimers at C-20.

In conclusion, the 1,4-trans addition of alkyl cyanocuprates to alkylideneoxiranes of sterols provides the only stereospecific methodology for the concomitant introduction of the C-21 asymmetric center and the 15 β -hydroxyl group. This synthetic

Page 6099, column 1, first paragraph: The NMR data for 1-(N-methylanilino)-1-phenyl-1-propene (**3**) should read: ¹H NMR (CDCl₃) 1.7 (3 H, doublet), 3.1 (3 H, singlet), 6.1 (1 H, quartet), 6.6-7.4 ppm (10 H, multiplet). The authors are indebted to Professor H. Ahlbrecht, Giessen, for detecting and communicating the error.

Synthesis of β -Lactams from Substituted Hydroxamic Acids [*J. Am. Chem. Soc.* **1980**, *102*, 7026]. M. J. MILLER,* P. G. MATTINGLY, M. A. MORRISON, and J. F. KERWIN, JR., Department of Chemistry, University of Notre Dame, Notre Dame, Indiana 46556.

The products from the intermolecular N-alkylation of O-benzyl hydroxamates (RCONHOCH₂Ph) with alcohols (R²OH) in the presence to DEAD/PPh₃ (last four entries in Table I) have been subsequently shown to be the O-alkyl isomers

and not the N-alkyl isomers

as reported. The products from the intermolecular alkylation of O-acylhydroxamates and the intramolecular alkylations to give β -lactams are correctly assigned.
