Harvard University, Cambridge, Massachusetts 02138

Received July 10, 2000

The nicandrenone (NIC) family of structurally complex, steroid-derived natural products includes the active principals of *Nicandra physaloides* (the Peruvian “shoofly” plant) which give rise to its insect repellent and antifeedant properties.<sup>1</sup> The novel structures of the nicandrenones were elucidated independently by groups in the US<sup>2</sup> and UK<sup>3</sup> almost 30 years ago. The NIC family is structurally related to another and even larger class of plant products, the withanolides.<sup>4</sup> No member of either group has been made by total synthesis. We describe herein the first syntheses of nicandrenones, specifically NIC-1 lactone (**1**), NIC-1 (**2**), and NIC-10 (**3**), by an approach which is both enantio- and diastereoselective.

The synthesis of the tetracyclic nicandrenone nucleus (Scheme 1) commenced with a highly unusual *exo*-selective Diels–Alder reaction to generate all four rings in a stereocontrolled way. Addition of diene **5**<sup>6</sup> (1.05 equiv) to a mixture of the chiral  $\alpha,\beta$ -enone **4**<sup>6</sup> and methylaluminum dichloride (1.05 equiv) in CH<sub>2</sub>Cl<sub>2</sub> at –78 °C over 2.5 h resulted in formation of the *exo* adduct **6** (85%, *exo-endo* selectivity >15:1 by <sup>1</sup>H NMR analysis). The mechanistic basis of the high *exo* selectivity in the reaction leading to **6** has recently been analyzed in detail.<sup>7,8</sup> Conversion of **6** to the benzoyloxymethyl (BOM) ether **7**<sup>9</sup> was accomplished in 82% overall yield by reduction with LiAlH<sub>4</sub> (1.05 equiv) in Et<sub>2</sub>O at –78 °C for 20 min and subsequent reaction with BOM-Cl (2 equiv) and EtN(*i*-Pr)<sub>2</sub> in CH<sub>2</sub>Cl<sub>2</sub> at 23 °C for 46 h. The  $\alpha,\beta$ -enone **8** was obtained from **7** in 64% overall yield by the following sequence: (1) TES cleavage with 0.6 equiv of *p*-toluenesulfonic acid in MeOH–CH<sub>2</sub>Cl<sub>2</sub> at 23 °C for 5 min, (2) trimethylsilyl enol ether formation with LDA–TMSCl in THF at –78 °C, and (3)  $\alpha,\beta$ -enone formation with 10 mol % Pd(OAc)<sub>2</sub> and O<sub>2</sub> in dimethyl sulfoxide (DMSO) in the presence of 2,6-di-*tert*-butyl-4-methylpyridine at 23 °C for 12 h. The carbonyl group of **8** was reduced (L-selectride, THF, –78 °C, 20 min) and the resulting allylic alcohol was subjected to *cis* epoxidation (*t*-BuOOH, 0.3 equiv of VO(acac)<sub>2</sub>, CH<sub>2</sub>Cl<sub>2</sub>, 0 °C, 20 h) and subsequent acetylation to give **9**<sup>9</sup> (71% from **8**). Deallylation of **9** (5 mol % Pd(Ph<sub>3</sub>P)<sub>4</sub>, excess Et<sub>2</sub>NH, CH<sub>2</sub>Cl<sub>2</sub>, 3 h at 40 °C) and

## Scheme 1

<sup>a</sup> MeAlCl<sub>2</sub>, CH<sub>2</sub>Cl<sub>2</sub>, –78 °C. <sup>b</sup> LiAlH<sub>4</sub>, Et<sub>2</sub>O, –78 °C. <sup>c</sup> C<sub>6</sub>H<sub>5</sub>CH<sub>2</sub>OCH<sub>2</sub>Cl, EtN(*i*-Pr)<sub>2</sub>, CH<sub>2</sub>Cl<sub>2</sub>, 23 °C. <sup>d</sup> *p*-TsOH, MeOH, 23 °C. <sup>e</sup> LDA, TMSCl, –78 °C. <sup>f</sup> Pd(OAc)<sub>2</sub>, O<sub>2</sub>, DMSO, 23 °C. <sup>g</sup> L-selectride, THF, –78 °C. <sup>h</sup> *t*-BuOOH, VO(acac)<sub>2</sub>, CH<sub>2</sub>Cl<sub>2</sub>, 0 °C. <sup>i</sup> Ac<sub>2</sub>O, Et<sub>3</sub>N, DMAP, –25 °C. <sup>j</sup> Pd(Ph<sub>3</sub>P)<sub>4</sub>, Et<sub>2</sub>NH, CH<sub>2</sub>Cl<sub>2</sub>, 40 °C. <sup>k</sup> C<sub>4</sub>F<sub>9</sub>SO<sub>2</sub>F, Et<sub>3</sub>N, CH<sub>2</sub>Cl<sub>2</sub>, 23 °C. <sup>l</sup> H<sub>2</sub>, Pd–C, 23 °C. <sup>m</sup> Dess–Martin periodinane, CH<sub>2</sub>Cl<sub>2</sub>, 23 °C. <sup>n</sup> K<sub>2</sub>CO<sub>3</sub>, MeOH, 23 °C. <sup>o</sup> MgI<sub>2</sub>, NaI, CH<sub>2</sub>Cl<sub>2</sub>–CH<sub>3</sub>CN, 0 °C. <sup>p</sup> CH<sub>3</sub>SO<sub>2</sub>Cl, Et<sub>3</sub>N, –60 to 23 °C. <sup>q</sup> *t*-BuOOH, VO(acac)<sub>2</sub>, CH<sub>2</sub>Cl<sub>2</sub>, 0 °C.

reaction with nonafluorobutanesulfonyl fluoride (NfF) and Et<sub>3</sub>N in CH<sub>2</sub>Cl<sub>2</sub> for 18 h at 23 °C produced the nonaflate **10**<sup>9</sup> (93% from **9**). Epoxy ketone **11**<sup>9</sup> was accessed from **10** in 86% overall yield by the following sequence: (1) BOM ether cleavage (1 atm H<sub>2</sub>, Pd–C, EtOAc–HOAc, 23 °C, 7 h), (2) Dess–Martin periodinane oxidation of the resulting alcohol (in CH<sub>2</sub>Cl<sub>2</sub> at 23 °C for 2 h), and (3) deacetylation (K<sub>2</sub>CO<sub>3</sub> in CH<sub>3</sub>OH at 23 °C). The oxiranyl carbinol subunit of **11** was unusually reactive as demonstrated by transformation to the corresponding 6 $\beta$ -iodo-5,7-diol structure upon treatment with 6 equiv of MgI<sub>2</sub> and 6 equiv of NaI in CH<sub>3</sub>CN–CH<sub>2</sub>Cl<sub>2</sub> at 0 °C for 10 min. Reaction of this diol with CH<sub>3</sub>SO<sub>2</sub>Cl–Et<sub>3</sub>N (2 equiv, 3 equiv) at –66 °C to +23 °C over 1.5 h resulted in elimination to form **12**<sup>9</sup> in 72% overall yield.<sup>10,11</sup> Epoxidation of **12** with *t*-BuOOH and 0.1 equiv of VO(acac)<sub>2</sub> in CH<sub>2</sub>Cl<sub>2</sub> at 0 °C for 44 h gave **13**<sup>9</sup> in 76% yield.

The enantioselective synthesis of the NIC-1 side chain fragment is outlined in Scheme 2, the starting point being the known lactone **14**.<sup>12</sup> Amidation with a reagent from 2.5 equiv of trimethylaluminum and 2.5 equiv of *N,O*-dimethylhydroxylamine hydrochloride

(5) Diene **5** was synthesized from 6-allyloxy-1-tetralone by the following sequence: (1) addition of 1-ethoxyvinyl lithium, (2) dehydration of the resulting tertiary alcohol, (3) hydrolysis of vinyl ether to methyl ketone, and (4) triethylsilyl (TES) enol ether formation using triethylsilyltriflate and triethylamine in CH<sub>2</sub>Cl<sub>2</sub> at 0 °C.

(7) Ge, M.; Stoltz, B. M.; Corey, E. J. *Org. Lett.* **2000**, *2*, 1927.

(8) The structure of adduct **6** (a racemic sample) was confirmed by reaction with CuCl<sub>2</sub> in dimethylformamide at 60 °C to form the corresponding  $\Delta$ (8)–1,7-diketone (steroid numbering, mp 172–3 °C) and subsequent X-ray crystallographic analysis. Detailed X-ray crystallographic data are available from the Cambridge Crystallographic Data Center, 12 Union Road, Cambridge, CB2 1EZ, U.K.

(9) This product was purified by column chromatography on silica gel.

(10) The formation of **12** from the 6 $\beta$ -iodo-5,7 $\alpha$ -diol precursor is considered to occur via the 7 $\alpha$ -mesylate by solvolysis to the 6,7- $\beta$ -iodonium ion which undergoes I<sup>+</sup> transfer to Et<sub>3</sub>N forming Et<sub>3</sub>NI<sup>+</sup>. The transfer of positive halogen to amines is well-known. For a similar elimination see: Corey, E. J.; Marfat, A.; Falck, J. R.; Albright, J. O. *J. Am. Chem. Soc.* **1980**, *102*, 1433.

(11) (a) Attempts to generate **12** by a Wharton elimination of 5,6- $\alpha$ -epoxy-7-keto intermediate with hydrazine were completely unsuccessful. See: Dupuy, C.; Luche, J. L. *Tetrahedron* **1989**, *45*, 3437. (b) For epoxidation reactions catalyzed by VO(acac)<sub>2</sub> see: Sharpless, K. B.; Michaelson, R. C. *J. Am. Chem. Soc.* **1973**, *95*, 6136.

(12) Lactone **14** was synthesized in two steps from 2,3-dimethylbutadiene as described by Aumann et al. (Aumann, R.; Ring, H.; Krüger, C.; Goddard, R. *Chem. Ber.* **1979**, *112*, 3644) using sequential monoepoxidation and Pd-catalyzed carbonylation.

## Scheme 2

ride<sup>13</sup> in  $\text{CH}_2\text{Cl}_2$  at  $-5^\circ\text{C}$  for 30 min followed by silylation of the resulting hydroxy amide **15** (*tert*-butyldimethylsilyl chloride, 2,6-lutidine,  $\text{CH}_2\text{Cl}_2$  at  $0^\circ\text{C}$  for 10 min) provided the protected amide **16**<sup>9</sup> (64% from **14**). Ethynylation of **16** with lithium trimethylsilylacetylide (THF,  $-20^\circ\text{C}$ , 1 h) produced ynone **17**<sup>9</sup> (61%) which was subjected to CBS reduction<sup>14</sup> using 1.2 equiv of catechol borane and 5 mol % of oxazaborolidine **18**<sup>15</sup> in  $\text{CH}_2\text{Cl}_2$  at  $-40^\circ\text{C}$  for 40 min to give after desilylation (KOH,  $\text{CH}_3\text{OH}$ ,  $23^\circ\text{C}$ , 10 min) the propargylic alcohol **19** in 92% yield and 95% ee.<sup>9,16</sup> Vinylstannane **20** was prepared by reaction of **19** with 1.5 equiv of tributyltin hydride and 0.1 equiv of  $\text{RhCl}(\text{PPh}_3)_3$  at  $23^\circ\text{C}$  for 20 h (47% yield).

The coupling of nonaflate **13** with vinylstannane **20** using the conditions recently developed for such difficult Stille reactions<sup>17</sup> (0.5 equiv of  $\text{Pd}(\text{Ph}_3\text{P})_4$ , excess of  $\text{CuCl}$ , and excess of  $\text{LiCl}$  in dimethyl sulfoxide at  $60^\circ\text{C}$  for 48 h) afforded **21**<sup>9</sup> in 74% yield. The completely diastereoselective transformation of **21** into the epoxide **22**<sup>9</sup> was effected in 88% overall yield by (1) reduction of terminal methylene with 1 atm of  $\text{H}_2$  and 0.4 equiv of  $\text{Rh}(\text{ncd})(\text{dppb})\text{BF}_4$ <sup>18</sup> in  $\text{CH}_2\text{Cl}_2$  at  $0^\circ\text{C}$  for 48 h and (2) epoxidation with *t*-BuOOH and 0.1 equiv of  $\text{VO}(\text{acac})_2$  in  $\text{CH}_2\text{Cl}_2$  at  $0^\circ\text{C}$  for 2 h. Conversion of **22** to the epoxy lactone **23**<sup>9</sup> was carried out in 90% overall yield by (1) TBS ether cleavage (3 equiv of  $\text{Bu}_4\text{NF}$  in THF at  $0^\circ\text{C}$ ) and (2) oxidation with 3 equiv of  $\text{NaOCl}$ , 10 mol %  $\text{KBr}$ , and 5 mol % TEMPO (Aldrich Co.) in  $\text{CH}_2\text{Cl}_2\text{-H}_2\text{O}$  at  $0^\circ\text{C}$  for 10 min. NIC-1 lactone (**1**) was obtained from **23** by (1) replacement of  $\text{Me}_2\text{PhSi}$  by hydroxyl using 5 equiv of  $\text{Hg}(\text{OAc})_2$  and  $\text{CH}_3\text{CO}_3\text{H}$  in  $\text{HOAc}$  at  $23^\circ\text{C}$  for 3 h<sup>19</sup> and (2)  $\beta$ -elimination by acetylation ( $\text{Ac}_2\text{O}$ ,  $\text{Et}_3\text{N}$ , DMAP at  $23^\circ\text{C}$ ) followed by treatment of the resulting  $\beta$ -acetoxy ketone with 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in  $\text{CH}_2\text{Cl}_2$  at  $23^\circ\text{C}$  for 3 h. NIC-1 lactone (**1**) was converted into NIC-1 (**2**) by the following sequence: (1) reduction at both C(1) and lactone carbonyls by diisobutylaluminum hydride in toluene, (2) selective acetylation of the more reactive lactol hydroxyl by  $\text{Ac}_2\text{O}\text{-Et}_3\text{N}$ , (3) Dess–Martin oxidation at C(1), and (4) deacetylation ( $\text{K}_2\text{CO}_3\text{-CH}_3\text{OH}$ ). Synthetic NIC-1 (**2**) was compared to authentic

samples<sup>20</sup> (500-MHz  $^1\text{H}$  NMR, 100-MHz  $^{13}\text{C}$ , IR, TLC, optical rotation, and mixed mp) and found to be indistinguishable.

The nonaflate **13** also provided ready access to NIC-10 (**3**) as shown in Scheme 4. Ring A hydroxy desilylation<sup>19</sup> and  $\beta$ -elim-

## Scheme 4

ination via the acetate, as described in Scheme 3 for **23**  $\rightarrow$  **1**, generated the  $\alpha,\beta$ -enone **24** (92%).<sup>9</sup> Stille coupling of **24** with 1-ethoxyvinyltributylstannane, as described for **13**  $\rightarrow$  **21**, afforded the corresponding tetracyclic 1-ethoxyvinyl ether, hydrolysis of which using 10 equiv of wet acetic acid in  $\text{CH}_2\text{Cl}_2$  at  $25^\circ\text{C}$  for 20 min provided NIC-10 (**3**),<sup>9</sup> as demonstrated by comparison with published physical data.

Apart from establishing the first totally synthetic route to nicanrenones **1–3**, there are a number of noteworthy features of the synthesis described herein: (1) the remarkably powerful *exo*-selective Diels–Alder construction **4** + **5**  $\rightarrow$  **6**, (2) the emplacement of the complex pattern of functionality of the A and B rings, (3) the development of new conditions for the otherwise unworkable coupling **13** + **20**  $\rightarrow$  **21**, and (4) the simple elaboration of the complex side chain.

**Acknowledgment.** We are grateful to the National Institutes of Health for financial support, Eduardo Martinez for the X-ray structure, and the following group members for valuable assistance: Drs. X. Han, M. Ge, and G. Sarakinos.
