## Crystallization: The low energy separation method for organics

Crystallization is a "one way" process. There are no repeated evaporations and condensations to effect purification. Latent heats of fusion are very low, making total utility costs low. Cooling crystallizations may be done without costly vacuum system, or other complex and energy intensive auxiliary equipment.

Armstrong continuous cooling crystallizers have been used with many organic separations such as fatty acids, paraxylene, naphthalene, dichlorobenzene, cresol, waxes and many others.

Pilot plant crystallizers available to rent to test new processes.
