

Abstracts

developed, depending upon the manner of life and the environmental conditions of each country. This paper presents the recent situation of laundry detergents and the detergent industry in the Far East in relation to the washing conditions in each country. Specifically, the development of phosphate-free, heavy-duty detergents is discussed from the viewpoint of the relationship between the formulations and their performances in reference to the selected surfactants and zeolite builders. Possible future trends of laundry detergents are discussed.

5.4 Surfactants in Non-Soap Detergent Bars and Pastes

During the past 15 years, in many developing nations, particularly India and those of southeast Asia, a new product type has emerged that complements non-soap detergent (NSD) powders and laundry soaps. The product is a direct-application one typified by NSD bars and pastes. Although the performance of individual actives and their accompanying builders is important, other factors can be just as influential in gaining consumer acceptance. As well as accounting for consumer habits and mode of use, it is necessary to ensure that the physical characteristics of the product are adequate. Factors such as hardness, rate wear and feel are important for bars, while phase stability and feel are essential for pastes. Lately, some interest has been shown in surfactants derived from natural products such as coconut oil. The properties and problems posed by the incorporation of coconut alcohol sulfate and α -sulfomethyl cocoate into bars and pastes have been investigated. The commercial use of such surfactants depends on political and ecological as well as financial considerations.

5.5 Surfactants for Laundry Liquids

O. Carl Kerfoot, Ted P. Matson and Michael F. Cox
Vista Chemical Co., PO Box 500, Ponca City, OK 74602, USA

Although the acceptance of laundry liquids varies dramatically among U.S., European and Japanese markets, most products worldwide still contain two or more of the following four surfactant types: (a) linear alkylbenzene sulfonates, (b) alcohol ethoxylates, (c) alcohol ether sulfates and (d) fatty acid soaps. Advances in surfactant technology

have concentrated on reoptimizing various blends of these surfactants to achieve maximum performance of other solution components (enzymes, softeners, etc.). The ability of each surfactant to meet various performance criteria under U.S., European and Japanese wash conditions, as well as their compatibility with other solution components, is discussed in relation to past, current and projected surfactant usage data.

Session VI—Formulation Technology: Surfactants in Non-laundry Products

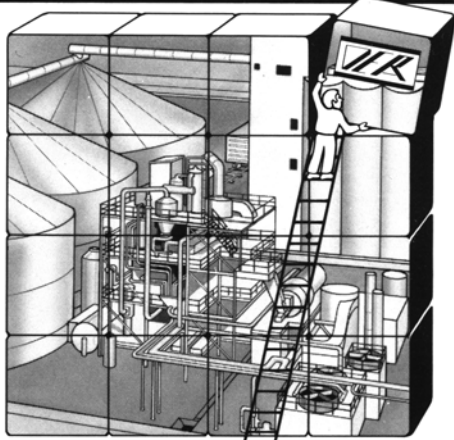

6.1 Dishwashing Products—U.S. Decade Review

Kathleen M. Fernee
Colgate-Palmolive Co., 909 River Rd., Piscataway, NJ 08854, USA

Overall, the U.S. dishwashing detergent category can be described as a competitive, mature market that has exhibited a sustained, modest growth pattern through the

Getting it together

takes an engineering consulting firm with a lot of experience.

At DER — "Getting It Together" — is taking the seed of an idea and developing it in a professional manner into a workable and cost-effective project. This means not only meeting immediate needs but also careful planning for the future. Our geographic location in the heart of corn and soybean country has given us a unique opportunity to serve the engineering needs of the grain processing industry. At DER, our team of engineering specialists has worked to solve many difficult and complex new construction and retrofit problems. Our services involve not only engineering but the dovetailing of the efforts of a contractor and suppliers. DER would like to put this expertise to work for your company.

WE INVITE YOU TO WRITE FOR OUR INFORMATIVE PORTFOLIO.
