

290. *The Reactions of Nitrosulphonyl Chlorides. Part III. Identification and Characterisation of Aldehydes and Ketones as Nitrobenzenesulphonhydrazones.*

By JAMES M. L. CAMERON and FREDERICK R. STORRIE.

CERTAIN mononitrobenzenesulphonhydrazones of aldehydes and ketones

have been described by Davies, Storrie, and Tucker (J., 1931, 624) and by Witte (*Rec. trav. chim.*, 1932, 51, 299). We describe below some more of these derivatives and give in Table I the melting points of those which have so far been prepared. We are indebted to Miss M. C. Nelmes for the observation that acetone-*p*-nitrobenzenesulphonhydrazone (*loc. cit.*) is dimorphic, and since these compounds sometimes exhibit dimorphism, the solvent used in crystallisation is stated in each case.

TABLE I.

*Mononitrobenzenesulphonhydrazones.*

Aldehyde or ketone.	Ortho-.	Meta-.	Para-.
1. Acetaldehyde .....	—	—	121—122°
2. Acetone.....	147—148° <i>a</i>	148—150° <i>a</i>	169—171 <i>a</i>

29. Phenyl <i>p</i> -tolyl ketone.....	128—130 ‡	—	—
30. Benzoin.....	—	159—160	—
31. Benzil (dihydrazone) .....	—	166—167	—

*a.* Prepared by Davies, Storrie, and Tucker. *b.* Prepared by Witte.

\* We find m. p. 130—131°. † Witte gives 178—179°. ‡ All melt with decomposition except those marked thus.

We also describe certain 2-chloro-5-nitrotoluene-4-sulphonhydrazones (some of which have already been prepared by Dann and Davies, J., 1929, 1050) and 2 : 4-dinitrobenzenesulphonhydrazones, and intend to prepare more of these derivatives. We are investigating a rapid method of analysing these substances, which should increase their importance in the identification and characterisation of aldehydes and ketones.

EXPERIMENTAL.

The *o*-, *m*-, and *p*-nitrobenzenesulphonhydrazones are prepared by the method described earlier (Davies, Storrie, and Tucker, *loc. cit.*), except that it has since been found that the *o*-nitrobenzenesulphonhydrazide can be isolated and dried without decomposition. Where

acetone is mentioned as the crystallising solvent, it is not, of course, the solvent used in the preparation of the derivative.

The number preceding each compound corresponds to that in Table I.

*o*-Nitrobenzenesulphonhydrazones.

No.	Appearance.	Solvent.	Formula.	N, %.	
				Found.	Calc.
3	Slightly yellow hexagonal prisms	EtOH	C <sub>10</sub> H <sub>13</sub> O <sub>4</sub> N <sub>3</sub> S	15·7	15·5

All the following hydrazones melt with decomposition. 2 : 4-Dinitrobenzenesulphonhydrazide is prepared as described by Davies, Storrie, and Tucker (*loc. cit.*), and its derivatives are prepared in the same manner as the mononitro-derivatives, except that the temperature must be kept below  $-10^{\circ}$  on account of the increased instability of the hydrazide. 2 : 4-Dinitrobenzenesulphonhydrazones of: (2) colourless, silky needles from acetone, m. p.  $148^{\circ}$  (Found : N, 18.8.  $C_9H_{10}O_6N_4S$  requires N, 18.6%); (17) yellow micro-crystals from acetone, m. p.  $188^{\circ}$  (Found : N, 16.0.  $C_{13}H_{10}O_6N_4S$  requires N, 16.0%); (19) yellow micro-crystals from acetone, m. p.  $177^{\circ}$  (Found : N, 11.6.  $C_{14}H_9O_8N_4BrS$  requires N, 11.6%); (20) orange needles from acetone, m. p.  $172-173^{\circ}$  (Found : N, 14.5.  $C_{14}H_{10}O_8N_4S$  requires N, 14.2%); (28) yellowish micro-crystals from acetone, m. p.  $132-133^{\circ}$  (Found : N, 12.8.  $C_{19}H_{14}O_6N_4S$  requires N, 13.1%).

2-Chloro-5-nitrotoluene-4-sulphonhydrazide is described by Dann and Davies (*loc. cit.*); the hydrazones are prepared as for the nitrobenzenesulphonhydrazones. Acetone-2-chloro-5-nitrotoluene-4-sulphonhydrazone, stout, colourless, hexagonal prisms from acetone, m. p.  $156-157^{\circ}$  (Found : N, 14.1.  $C_{10}H_{12}O_4N_3ClS$  requires N, 13.8%). Benzaldehyde-2-chloro-5-nitrotoluene-4-sulphonhydrazone, stout, colourless prisms from alcohol, m. p.  $158-160^{\circ}$  (Found : N, 11.8.  $C_{14}H_{12}O_4N_3ClS$  requires N, 11.6%).

The acetone-*p*-nitrobenzenesulphonhydrazone described by Davies, Storrie, and Tucker (*loc. cit.*) as melting at  $169-171^{\circ}$  when crystallised from acetone, has m. p.  $183-184^{\circ}$  when crystallised from alcohol, the latter being the more stable form.

The authors thank Miss M. E. C. Anderson, and Messrs. R. B. Carswell, R. L. Jones, and J. Lindsay for preparing some of the compounds described above.

THE UNIVERSITY OF GLASGOW.
