SYMBOLS FOR THERMODYNAMICAL AND PHYSICO-CHEMICAL QUANTITIES AND CONVENTIONS RELATING TO THEIR USE, ADOPTED AS RECOMMENDED PRACTICE BY THE CHEMICAL SOCIETY.

(Where two or more symbols separated by commas or semicolons are given for a quantity, these symbols are to be regarded as alternatives for which no preference is expressed. On the other hand, where two symbols are separated by a dotted line, the former is the first preference.)

#### 1. To be Printed in Black Italic.

(Certain important physical constants.)

- F Faraday's constant.
  J Mechanical equivalent of heat.
  N Avogadro's number.
  Gas constant per mol.
  Rydberg's constant.
- Velocity of light in vacuo.
  Electronic charge (charge equal and opposite in sign to that of an electron).
- **g** Acceleration due to gravity (standard value, if variation from standard is significant).
- h Planck's constant.
- **k** Boltzmann's constant.
- m Rest mass of an electron.

### 2. To be Printed in Ordinary Italic, when not Greek.

General Physics and Chemistry.

| gram .   |        |        |        |       | •      | •      | •      |      | g.   |
| litre .  |        |        | •      | •     | •      | •      | •      | •    | 1.   |
| Röntgen u  |        | •      | •      | •     | •      | •      | •      | •    | r.   |
| †Normal (d   | conce  | ntrat  | ion)   |       |        | •      |        |      | N.   |
| †Molar (cò   | ncent  | tratio | n) ´   | •     |        | •      |        |      | м.   |
|  |        |        |        |       |        |        |        |      |  |
| * E.g. "ma." for "milliampère"; but "amp." is preferred for "ampère." † Separated by a hyphen (and no full stop) from a chemical formula which follows it. |        |        |        |       |        |        |        |      |  |

The following prefixes to abbreviations for the names of units should be used to indicate the specified multiples or sub-multiples of these units:

| M | mega-  | $10^{6} 	imes$          |
|---|--------|-------------------------|
| k | kilo-  | $10^3 \times$           |
| d | deci-  | $10^{	extsf{-1}} 	imes$ |
| С | centi- | $10^{-2} \times$        |
| m | milli- | $10^{-3} \times$        |
| μ | micro- | $10^{-6} \times$        |

e.g.,  $M\Omega$ . denotes megohm; kw., kilowatt; and  $\mu g$ ., microgram. The use of  $\mu \mu$ . instead of  $\mu \mu$ . to denote  $10^{-7}$  cm., or of  $\gamma$  to denote microgram is deprecated.

## 4. Subscripts and other Modifying Signs.

(a) Subscripts to symbols for quantities.

| I, II<br>1, 2<br>A, B<br>i | (especially with symbols for thermodynamic functions, referring to different systems or different states of a system. referring to molecular species A, B, etc. referring to a typical ionic species i. referring to an undissociated molecule. |
|----------------------------|---|
| +, -                       | referring to a positive or negative ion, or to a positive or negative electrode.  |
| p, v, T                    | indicating constant pressure, volume, and temperature respectively.   |
| q                          | indicating adiabatic conditions.  |
| ¥                          | indicating that no work is performed.   |
| p, c, a                    | with symbol for an equilibrium constant, indicating that it is expressed in terms of pressure, concentration, or activity.  |
| g, v, l, x                 | referring to gas, vapour, liquid, and crystalline states, respectively.   |
| f, e, s, t, d              | referring to fusion, evaporation (vaporisation of liquid), sublimation, transition, and dissolution or dilution respectively.   |
| c                          | referring to the critical state or indicating a critical value.   |
| 0                          | referring to a standard state, or indicating limiting value at infinite dilution.   |
| 0, D, F                    | with symbols for optical properties, referring to a particular wavelength.  |
| ****                       |   |

Where a subscript has to be added to a symbol which already carries a subscript, the two subscripts may be separated by a comma or the symbol with the first subscript may be enclosed in parentheses with the second subscript outside.

#### (b) Other modifying signs.

- o as right-hand superscript to symbol, referring to a standard state.

  [] enclosing formula of chemical substance, indicating its molar concentration.
- {} enclosing formula of chemical substance, indicating its molar activity.

```
In crystallography it is recommended that:

Millerian indices be enclosed in parentheses, ();

Laue indices be unenclosed;

Indices of a plane family be enclosed in braces, {};

Indices of a zone axis or line be enclosed in brackets, [].
```

Numerals attached to a symbol for a chemical element in various positions have the following meanings:

```
upper left mass number of atom. nuclear charge of atom. lower right number of atoms in molecule. e.g., {}_{3}^{7}\text{Li}; {}_{1}^{2}\text{H}_{2} (= D_{2}).
```

# ALPHABETICAL INDEX OF RECOMMENDED SYMBOLS, and single-letter abbreviations.

including all those given in the above lists except prefixes, subscripts and other modifying signs.

The name of any quantity for which a given symbol is a second preference is printed in parentheses.

```
\boldsymbol{A}
     free energy—Helmholtz; atomic weight; surface area.
     Angstrom unit.
A.
     activity; (acceleration).
a
     ampère, in sub-units-see footnote, p. 2093.
a.
\boldsymbol{B}
     magnetic induction.
     concentration; electrostatic capacity.
     with subscript: molecular heat capacity.
c.
     Centigrade.
     velocity of light in vacuo.
c
     velocity; concentration.
С
     with subscript: specific heat.
D
     diffusion coefficient.
     diameter; distance; (density).
d
d
     differential.
     partial differential.
\boldsymbol{E}
     energy; (intrinsic energy); potential difference, especially electromotive
       force of voltaic cells.
     with subscript: single electrode potential.
     electronic charge—charge equal and opposite in sign to that of an electron.
e
     quantity of electricity, especially electrostatic charge.
     with subscript: single electrode potential.
     base of natural logarithms.
е
     Faraday's constant.
     force; (free energy—Helmholtz).
\boldsymbol{F}
     farad; Fahrenheit.
     acceleration; activity coefficient, for molar concentration; partition
f
       function.
```

```
f
    function.
G
    thermodynamic potential, Gibbs function, free energy-G. N. Lewis.
    acceleration due to gravity, standard value.
\boldsymbol{g}
    acceleration due to gravity, as a variable; osmotic coefficient.
g
\overline{H}
    enthalpy, total heat, heat content; magnetic field strength.
н.
    henry.
    Planck's constant.
h
h
    height.
Ι
    moment of inertia; ionic strength; electric current; intensity of light.
    vapour pressure constant; van 't Hoff's factor.
J
    mechanical equivalent of heat.
J_K
     gram-equivalent weight.
    chemical equilibrium constant; (compressibility).
    K_s solubility product.
    Kelvin.
ĸ.
    Boltzmann's constant.
k
\boldsymbol{k}
    thermal conductivity; velocity constant of chemical reaction.
L
    latent heat per mol; self inductance; (solubility product).
    latent heat per g.; length; mean free path of molecules.
    with subscript: equivalent ionic conductance, "mobility".
1.
    litre.
M molecular weight; mutual inductance; magnetic moment.
    molar concentration.
m rest mass of an electron.
m mass.
m. metre.
    Avogadro's number.
N
    mol fraction.
    normal concentration.
     number of mols.
     with subscript: (transport number).
     with subscript: refractive index.
     pressure.
[P] parachor.
\stackrel{p}{Q}
     pressure.
     quantity of electricity.
     heat entering a system.
     gas constant per mol; Rydberg's constant.
\bar{R}
     electrical resistance.
[R] with subscript: molecular refraction.
     radius; (specific resistance).
     with subscript: specific refraction.
     Röntgen unit.
S
     entropy.
     solubility; (surface area).
T
     temperature, on absolute Kelvin scale.
     with subscript: transport number.
     time; (temperature—not on absolute scale).
```

```
U
    intrinsic energy.
    velocity component.
    with subscript: velocity of ions.
    volume; potential, potential difference, including Volta potential.
v.
    volume; velocity; velocity component.
v
W
    (work done by or on a system).
    work done by or on a system; velocity component.
X
    force component; potential gradient in electric field.
    mol fraction.
Y
    force component.
    force component; g.-equivalent weight; number of molecular collisions
Z
       per second; atomic number.
z
    valency of an ion.
    degree of electrolytic dissociation; angle of optical rotation.
    specific optical rotation.
    surface concentration excess.
    ratio of specific heats; surface tension.
    increment.
δ
    very small increment.
    dielectric constant; molar extinction coefficient.
ε
ζ
    electrokinetic potential.
     efficiency of any process; viscosity; electrolytic polarisation, overvoltage.
\theta
     angle of contact; temperature—not on absolute scale.
    compressibility; specific conductance; magnetic susceptibility—volume.
Λ
    equivalent conductance.
λ
    wave length.
    chemical potential; dipole moment; magnetic permeability.
\mu
    with subscript: (refractive index).
    frequency; wave number.
Π
    pressure, especially osmotic pressure.
Π
    product.
     (electrolytic polarisation, overvoltage).
\pi
π
    ratio of circumference to diameter.
    density; specific resistance.
    diameter of molecules; (surface tension); (specific conductance).
σ
    time interval, especially half or mean life.
    fluidity; electronic exit work function; magnetic flux.
φ
     function.
    magnetic susceptibility—mass.
     wave function.
    ohm.
    angular velocity; specific magnetic rotation.
     6 \, \bar{\mathrm{u}}
```
