# Bonding in 1,2,4-Triazoles. Part VI. ${ }^{1}$ Crystal Structure of 6-Mercapto-3-phenyl-s-triazolo[4,3-b]-s-tetrazine Pyridine Adduct 

By R. C. Seccombe and C. H. L. Kennard," Department of Chemistry, University of Queensland, Brisbane, Queensland 4067, Australia

The crystal structure of the title compound $(\mathrm{V})$ has been determined from three-dimensional diffractometer data. Crystals are orthorhombic, space group Pbcn, with $z=16$ in a unit cell of dimensions: $a=1204 \cdot 56(7), b=$ $1494.23(9)$, and $c=3153.2(1) \mathrm{pm}$. The refinement was halted at $R 0.044$ for 3483 observed reflections. The triazole and tetrazine rings are planar with the phenyl groups rotated by 7 and $12.5^{\circ}$ in the two molecules of an asymmetric unit.
Mean interatomic distances (pm; each $\pm 0 \cdot 3$ ): $\mathrm{C}-\mathrm{S} 167 \cdot 2, \mathrm{~N}-\mathrm{N}$ (ring) 137.2, $\mathrm{N}-\mathrm{N}$ (side-chain), $\mathrm{N}(4)-\mathrm{N}(9)$ 135•7. $N(7)-N(8) 136 \cdot 2$; ring $N(2)-C(3) 131 \cdot 6 ; C(3)-N(4) 137 \cdot 3$; $N(4)-C(5) 137 \cdot 3$, and $C(5)-N(1) 162 \cdot 1$.

Dickinson and Jacobsen ${ }^{2}$ have found that 4 -amino-3-hydrazino-5-mercapto-1,2,4-triazole (I) reacts with benzaldehyde in the presence of base to form an unstable monobenzylidene intermediate, either (II) or (III). This is rapidly converted into $1,2,3,4$-tetrahydro-6-mercapto-$s$-triazolo $[4,3-b]$-s-tetrazine (IV) which will revert back to the monobenzylidene but in the opposite conformation, (III) or (II). At the liquid-air interface, (IV) is rapidly oxidized (ca. 1 min ) by aerial oxygen to a purple 6-mercapto-3-phenyl-s-triazolo[4,3-b]-s-tetrazine (V). This contribution deals with the structure of (V).
${ }^{1}$ Part V, R. C. Seccombe and C. H. L. Kennard, preceding paper.

## discussion

The arrangement of the atoms in the molecules are shown in Figure 1.

Throughout this discussion, the mean for the two molecules in the asymmetric unit is given. In all cases, the two distances for a particular bond are very close to one another with the greatest deviation being for the $\mathrm{C}(15)-\mathrm{C}(16)$ bond ( 1.3 pm ).

In this structure, there is a six-membered tetrazine ring connected to the five-membered triazole ring along the $\mathrm{C}(3)-\mathrm{N}(4)$ bond.
${ }^{2}$ R. G. Dickinson and N. W. Jacobsen, Chem. Comm., 1970, 1719.

Of the three $\mathrm{N}-\mathrm{N}$ distances in the molecule $\mathrm{N}(7)-\mathrm{N}(8)$ $(129.7 \mathrm{pm})$ is shorter than $\mathrm{N}(4)-\mathrm{N}(9)(135.7 \mathrm{pm})$ in the tetrazine ring and $\mathrm{N}(1)-\mathrm{N}(2)(137 \cdot 2 \mathrm{pm})$ in the triazole ring. This compares with the $\mathrm{N}(1)-\mathrm{N}(2)$ length in $1,2,4$ triazole ${ }^{3}(135 \cdot 9 \mathrm{pm})$. The $\mathrm{S}-\mathrm{C}$ bond length ( $167 \cdot 2 \mathrm{pm}$ ) is

shorter than the single $\mathrm{S}-\mathrm{C}$ bond in methanesulphonanilide ${ }^{4}(174 \cdot 6 \mathrm{pm})$ and similar to that in 4 -amino-3-( $\beta-$ benzoylhydrazino)-5-mercapto-1,2,4-triazole ${ }^{5}$ ( 166.8 pm ) and in (I) ${ }^{6}(\mathbf{1 6 8} \cdot 1 \mathrm{pm})$. This suggests that the tetrazine ring has no influence on the $\mathrm{S}-\mathrm{C}$ bond. One $\mathrm{C}-\mathrm{N}$ distance within the triazole ring, $[\mathrm{N}(2)-\mathrm{C}(3) 131.6 \mathrm{pm}]$, is significantly shorter than the other three $[\mathrm{N}(1)-\mathrm{C}(5) 135 \cdot 7$, $\mathrm{C}(5)-\mathrm{N}(4) \quad 137 \cdot 3$, and $\mathrm{N}(4)-\mathrm{C}(3) \quad 137 \cdot 3 \mathrm{pm}]$. The $\mathrm{C}(5)-\mathrm{N}(1)$ bond is longer than observed in other triazoles. ${ }^{1,5-8}$ This lengthening may be due to the influence of the tetrazine ring although it has no apparent effect on the $\mathrm{N}(2)-\mathrm{C}(3)$ bond. The $\mathrm{C}(3)-\mathrm{N}(4)$ and $\mathrm{N}(4)-\mathrm{C}(5)$ bond lengths are equivalent although the $\mathrm{C}(3)-\mathrm{N}(4)$ bond is common to both ring systems. Apart from this bond, there are two other $\mathrm{C}-\mathrm{N}$ distances in the tetrazine ring: $\mathrm{C}(10)-\mathrm{N}(8)(141.8 \mathrm{pm})$ which is close to a single-bond and $\mathrm{C}(10)-\mathrm{N}(9)(130 \cdot 4 \mathrm{pm})$ which is close to

a double-bond distance. Of the possible canonical forms, (A) comes closest to describing the bonding scheme.

Molecule (A)

Figure 1 Stereochemical arrangements of 6-mercapto-3-phenyl-$s$-triazolo $[4,3$ - $b]$ - $s$-tetrazine pyridine adduct; $\sigma$ : for bond distances 0.3 pm , for bond angles $0.2^{\circ}$; including hydrogen: distances 0.9 pm , angles $1.3^{\circ}$

[^0]In the unit cell the tetrazine molecules are stacked in two sheets almost perpendicular to the $b c$ plane and arranged at $c a .130^{\circ}$ to each other (Figure 2). The pyridine molecules are also arranged parallel to the tetrazine molecules, along the $c$ axis: at $y=0, \frac{1}{2}$, as an unconnected string of pyridine molecules, while the triazole molecules occur at $y=\frac{1}{4}, \frac{3}{4}$. Intermolecular

distances are not $<330 \mathrm{pm}$, e.g. $\mathrm{S} \cdots \mathrm{N}\left(\mathbf{7}^{\prime}\right) 347$, $\mathrm{S}^{\prime} \cdots \mathrm{N}(8) 345$, and $\mathrm{N}(9) \cdots \mathrm{C}\left(5^{\prime}\right) 332 \mathrm{pm}$.

The atoms of the triazole ring and the sulphur atom constitute a plane, with tetrazine and phenyl rings bent away. The phenyl groups are rotated by ca. $7^{\circ}$ in one molecule and $12.5^{\circ}$ in the other.

## EXPERIMENTAL

Crystal Data.- $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{~N}_{7} \mathrm{~S}, M=309.35$. Orthorhombic $a=1204 \cdot 56(7), \quad b=1494 \cdot 23(9), \quad c=3153 \cdot 2(1) \mathrm{pm}, \quad U=$ $5.6775 \mathrm{~nm}^{3}, D_{\mathrm{m}}=1.40$ (by flotation), $Z=16, D_{\mathrm{c}}=1.45$, $F(000)=2560 . \quad \mathrm{Cu}-K_{\alpha} \quad$ radiation, $\quad \lambda=154 \cdot 18 \mathrm{pm}$; $\mu\left(\mathrm{Cu}-K_{\alpha}\right)=20.96 \mathrm{~cm}^{-1}$. Space group $\operatorname{Pbcn}\left(D_{2 h}^{14}\right.$, No. 60$)$. Unit-cell parameters were refined by least-squares from highangle reflections. Data were obtained from a crystal measuring $0.15 \times 0.175 \times 0.25 \mathrm{~mm}$ on a Siemens automatic singlecrystal diffractometer. ${ }^{9,10}$ The integrated intensities were recorded by the $\theta-20$ scan using a five value method. ${ }^{11}$ Scan speed was preset with an upper limit of 0.6 s per step of $0.01^{\circ}$. Nickel attenuators were selected so that the total

Figure 2 Packing in the unit cell
recorded counts for all reflections was of the same order of magnitude (i.e. ca. $10^{5}$ counts $\mathrm{min}^{-1}$ ). A standard reflection was monitored every 50 reflections. To prevent decomposition the crystal used was coated with a thin film of Vaseline, which was found to be effective, since the variation of the standard reflection was less than its standard deviation. 3843 of the 5397 independent reflections collected up to $2082^{\circ}$ were considered observed having $I>2 \cdot 5 \sigma$ ( $I$ ). The data were corrected for Lorentz, polarisation, and absorption.

Structure Determination.-The structure was determined by the symbolic addition method. The largest $345 E$ values were used to generate $\Sigma_{2}$ relationships. Three origin-defining reflections were selected: $1,4,3, E 6 \cdot 45$; $1,4,4, E 4.91$; and $1,5,6, E 3 \cdot 26$. Four other reflections were also chosen and given symbols: $0,4,3, E 5 \cdot 35, A$; $2,8,7, E 4 \cdot 55, B ; 8,1,19, E, 4 \cdot 18, C$; and $1,8,6, E 3 \cdot 28, D$. Signs or symbols were generated for the 345 largest $E$ values by use of the $\Sigma_{2}$ relationships. A set of signs ( $A-, B+$, $C-, D-$ ), giving the strongest indications of being correct, was chosen and an $E$ map computed.

Because of the nature of the packing of the molecules in the unit cell, some reflections have very large $E$ values ( $1,4,3,6.45 ; 0,4,3,5 \cdot 35 ; 1,4,4,4 \cdot 92$; and $2,8,7,4 \cdot 55$ ). Other reflections involved will therefore have a high triplet product. The structure was solved by restricting the $\Sigma_{2}$ relationships used to expand the sign and symbol relationships to those which had a triple minimum value $>10 \cdot 0$. All the non-hydrogen atom positions were found from the $E$ map. Full-matrix least-squares refinement reduced the residual $R$ from an initial value of 0.497 to 0.097 . A differ-ence-Fourier synthesis revealed the positions of the hydrogen atoms. Full-matrix least-squares refinement with anisotropic temperature factors for all non-hydrogen atoms and

[^1]isotropic temperature factors for the hydrogen atoms reduced $R$ to 0.044 and the weighted residual $R^{\prime}$ to $0.036\left\{R^{\prime}=\right.$ $\left.\left[\Sigma \omega\left(\left|F_{\mathrm{o}}\right|-\left|F_{\mathrm{c}}\right|\right)^{2} / \Sigma \omega\left|F_{\mathrm{o}}\right|^{2}\right]^{\frac{1}{2}}\right\}$.

Although the refinement had not yet converged, it was halted at this stage because of excessive computing time involved. Three reflections were seen to be affected by extinction from a plot of $I_{\mathrm{c}} / I_{\mathrm{a}}$ vs. $I_{\mathrm{c}}{ }^{12}$ but no correction to the data was made. A final difference electron-density map revealed no features. None of the 345 phases determined during the symbolic addition procedure changed sign during the refinement stages. A weighting scheme using the $\sigma$ values calculated from counting statistics was chosen. The final atomic parameters together with their standard deviations are in the Table. Observed and calculated structure factor amplitudes are listed in Supplementary Publication No. SUP 20508 ( 7 pp., 1 microfiche).* Atomic scattering factors for carbon and nitrogen were taken from ref. 13, for sulphur from ref. 14, and for hydrogen from ref. 15 ; those for sulphur were corrected for anomalous dispersion. ${ }^{13}$

All computations ${ }^{16}$ were made on an IBM 360/50 at the University of New South Wales, Sydney.

We thank Dr. N. W. Jacobsen and R. G. Dickinson for suggesting the work and supplying the crystals, the Australian Research Grant Committee and the University of Queensland for financial support, Professor N. C. Stephenson, for making the diffractometer available, at the University of New South Wales, D. C. Craig for data collection, and Dr. C. T. Grainger for the use of ' Direct Methods ' programs.
