Hardcover. DM 98.-/£ 30.00. ISBN 3-527-26219-9

In recent years numerous governments have commissioned studies to investigate the level of fat in Western diets and its relationship to a range of diseases.

The role of fats in human nutrition is a controversial subject. This book presents facts about the biosynthesis, absorption and metabolism of fats and the biochemistry of saturated and polyunsaturated fatty acids. It discusses the physiological effects of unsaturated fatty acids and considers ways of reducing and changing the nature of fat in the diet to ensure the maintenance of an active and healthy life-cycle.

The book provides essential reading for all who are concerned with the effects of fat in the diet.

It will assist in placing recent publications in perspective.
