# Biotransformations

## A survey of the biotransformations of drugs and chemicals in animals

### Volume 3

Edited by: D. R. Hawkins, *Huntingdon Research Centre Ltd, UK*

**Biotransformations** is an important series which has been devised to bring together all current information on the subject, in a readily accessible form. **Volume 3** provides up-to-date information on the biotransformation of pharmaceuticals, pesticides, food additives, and environmental and industrial chemicals in animals and will be of great interest to chemists, biochemists and toxicologists in a wide variety of industries, as well as to regulatory authorities and legislative bodies. Each volume reviews biotransformation pathways that have been reported in the literature in the preceding twelve months and although successive volumes may cover similar compounds the biotransformation pathway in each case will differ.

**Volume 3** contains almost 270 abstracts covering the literature published during 1989 and provides the following information:

- ★ compound name
- ★ use/occurrence
- ★ key functional groups
- ★ test systems
- ★ structure and biotransformation pathway
- ★ precis of the test
- ★ references

The abstracts are arranged according to chemical classes and are assigned to key functional groups – a concept which has been developed to provide access to information on the biotransformations of compounds with similar structural features.

A listing of key functional groups is provided at the beginning of the book, together with an overview chapter which contains highlights such as novel biotransformations, mechanisms for toxicity and notable species differences.

**Biotransformations Volume 3** is cumulatively indexed by compound, key functional group and reaction type, covering all entries in Volumes 1–3.
