## Crystal and Molecular Structure of Tetramethylformamidiniumphosphonate, $\left[\mathrm{Me}_{2} \mathrm{~N}\right]_{2} \mathrm{CPO}_{3} \mathrm{H}$

## By J. J. Daly, Monsanto Research S.A., Eggbühlstrasse 36, CH-8050 Zürich, Switzerland

Crystals of the title compound, an inner salt $\left[\mathrm{Me}_{2} \mathrm{~N}\right]_{2} \mathrm{CPO}_{3} \mathrm{H}$, are monoclinic, space-group $P 2_{1} / c$ with $a=8.415$ $b=7.719, c=12.719 \AA, \beta=91.5^{\circ}, Z=4$. The structure was solved by direct methods from diffractometer data for 1414 planes, and refined by least squares to a final $R$ of 0.047 . The $\left(\mathrm{PO}_{3} \mathrm{H}\right)$ - group is linked to the central carbon atom of the $\left(\mathrm{Me}_{2} \mathrm{~N}: \mathrm{C} \cdot \mathrm{NMe}_{2}\right)^{+}$group by a $\mathrm{P}-\mathrm{C}$ bond of $1 \cdot 890(2) \AA$. The central carbon atom and the two nitrogen atoms of the formamidinium group all adopt planar configurations.

BIRUM ${ }^{1}$ has shown that tetramethylformamidiniumphosphonate (I) may be synthesised according to equation (1). This novel compound is related to the

$+\left(\mathrm{Me}_{2} \mathrm{~N}\right)_{2} \mathrm{CO}+6 \mathrm{RCl}$
to find the effect of the environment on the $\mathrm{P}-\mathrm{C}$ bond length and to extend the knowledge of formamidinium and phosphonate derivatives.

EXPERIMENTAL
Crystal Data. $-\mathrm{C}_{5} \mathrm{H}_{13} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{P}, \quad M=180 \cdot 1$, Monoclinic, $a=8.415(5), b=7.719(5), c=12.719(8) \AA, \beta=91.5(2)^{\circ}$, $U=825.9 \AA^{3}, \quad D_{\mathrm{m}}=1445, Z=4, \quad D_{\mathrm{c}}=1449$. Мо- $K_{\alpha}$ radiation, $\quad \lambda=0.71069 \quad \AA ; \quad \mu\left(\mathrm{Mo}-K_{\alpha}\right)=2.94 \quad \mathrm{~cm}^{-1}$. Space-group $P 2_{1} / c$.

Cell dimensions were obtained by a least-square process from precession photographs and standard deviations derived from this process have been doubled to allow for

[^0]systematic errors. Throughout this paper the standard deviations are given in parentheses as units in the last place of decimals.

The intensities were collected round $a$ on a Hilger and Watts linear diffractometer ${ }^{2}$ equipped with strontium carbonate-zirconium oxide balanced filters. The crystal used was $0.6 \times 0.4 \times 0.2 \mathrm{~mm}$ and the 1414 strongest reflections were used for the analysis.

Structure Determination and Refinement.-The positions of all atoms except hydrogen were found from the $E$ map ${ }^{3}$ after an application of direct methods $\mathbf{4 , 5}^{5}$ and this trial structure was then refined, first with isotropic and then

Figure 1 The molecule projected on the least-squares plane through $P, C(1), N(1)$, and $N(2)$
with anisotropic temperature factors. When $R$ had fallen to 0.083 a difference map was calculated which gave the positions of the hydrogen atoms. After further refinement ( $R 0.064$ ) it was found that the scale-factors used for the layers $4-9 k l$ were the squares of the correct values. This error was put right and refinement was continued until convergence at $R \quad 0.044$ and $R^{\prime} 0.0045$ ( $R^{\prime}=\Sigma \omega \Delta^{2} / \Sigma \omega F_{o}{ }^{2}$ ).
Since the anisotropic temperature factors of the hydrogen atoms were unrealistic, they were replaced by isotropic ones 0.01 units of $U$ higher than the atoms to which they are bonded and the final structure-factors so calculated gave $R \quad 0 \cdot 047$. A least-squares block-diagonal $(3 \times 3$ for positional and $\mathbf{1} \times \mathbf{1}$ or $\mathbf{6} \times \mathbf{6}$ for thermal parameters) process was used with $w^{-1}=3.0+\left|F_{o}\right|+0.03 F_{0}{ }^{2}$.

## RESULTS AND DISCUSSION

The final observed and calculated structure-factors are listed in Supplementary Publication No. SUP 20344 ( 10 pp., 1 microfiche).* Table 1 summarises these data as a function of $h$ and of the magnitude of $\left|F_{\mathrm{o}}\right|$; it shows the usual trend found with our diffractometer, that $R$ increases as the magnitude of $\left|F_{\mathrm{o}}\right|$ decreases and so the weaker high layers exhibit less good agreement than the stronger lower layers. Tables 2-4 give the final parameters and the bond lengths and angles. Table 5 lists some important planes in the molecule. Figure 1 shows the molecule projected on the weighted ( $w=$ atomic number) plane through

* For details see Notice to Authors No. 7 in J. Chem. Soc. (A), 1970, Issue No. 20.
$\mathrm{P}, \mathrm{C}(1), \mathrm{N}(1)$, and $\mathrm{N}(2)$, and the labelling of the atoms. Figure 2 illustrates the packing and the hydrogen bonding.

The compound (I) forms centrosymmetric hydrogen

Isotropic temperature factors, $U_{\text {iso }}$, are defined by $\left[\left(U_{11}{ }^{2}+U_{22}{ }^{2}+U_{33}{ }^{2}\right) / 3\right]$.
group, $\mathrm{H}_{3} \mathrm{~N}^{+}-\mathrm{CH}_{2} \cdot \mathrm{CH}_{2} \cdot \mathrm{PO}_{3} \mathrm{H}^{-6}$ and $\mathrm{HN}^{+}\left(\mathrm{CH}_{2} \cdot \mathrm{PO}_{3} \mathrm{H}_{2}\right)_{2}$ $\left(\mathrm{CH}_{2} \cdot \mathrm{PO}_{3} \mathrm{H}\right)^{-7}$ have a more complex hydrogen-bonding system which involves $\mathrm{NH} \cdot \mathrm{O}$ hydrogen bonds.

Figure 2 The packing arrangement in the (010) projection. Hydrogen bonds are shown as dashed lines

The three phosphinic acids $\mathrm{Me}_{2} \mathrm{PO}_{2} \mathrm{H}^{,}{ }^{8} \mathrm{Pl}_{2} \mathrm{PO}_{2} \mathrm{H},{ }^{9}$ and $\mathrm{C}_{13} \mathrm{H}_{11} \mathrm{O}_{2} \mathrm{P}$ (IV) ${ }^{10}$ form infinite chains through hydrogen bonding.

The $O(3)$ oxygen atom, which is not involved in hydrogen bonding, undergoes more thermal motion ( $U_{\text {iso }} 0.064 \AA^{2}$ ) than the other two [ $U_{\text {iso }} 0.051$ for $\mathrm{O}(\mathrm{l})$

[^2]and 0.052 for $\mathrm{O}(2)]$ and if the $\mathrm{P}-\mathrm{O}$ bond lengths are corrected for riding thermal motion ${ }^{11}$ with these values for $U_{\text {iso }}$, their values become: $\mathrm{P}-\mathrm{O}(1) 1 \cdot 506, \mathrm{P}-\mathrm{O}(2)$ 1.571 , and $\mathrm{P}-\mathrm{O}(3) 1.495 \AA$. Although the validity of

such a simplified procedure is doubtful, it makes one cautious of saying that the $\mathrm{P}-\mathrm{O}(1)$ and $\mathrm{P}-\mathrm{O}(3)$ bond lengths are quite different. It does, however, seem

(IV)
reasonable to say that the $\mathrm{P}-\mathrm{OH}[\mathrm{P}-\mathrm{O}(2)]$ bond length is longer than the other two $\mathrm{P}-\mathrm{O}$ bond lengths; a similar difference has been observed ${ }^{6,7}$ in phosphonic acids. The angles at the phosphorus atom vary from $103.5^{\circ}$
bond radii ( $1.83 \AA$ ). The corresponding $\mathrm{C}-\mathrm{X}$ bond length in uronium (II) ${ }^{12-17}$ and thiouronium (III) ${ }^{18-20}$ compounds is considerably less than the normal $\mathrm{C}-\mathrm{X}$ length but in these compounds the lone-pair electrons may contribute to the bonding in forms such as $\left(\mathrm{H}_{2} \mathrm{~N}\right)_{2^{-}}$ $\mathrm{C}: \mathrm{X}^{+} \cdot \mathrm{R}$. In thiourea dioxide, $\left(\mathrm{H}_{2} \mathrm{~N}\right)_{2} \mathrm{CSO}_{2}$ also called Manofast, where the sulphur lone-pairs are no longer available for carbon-sulphur bonding, the $\mathrm{C}-\mathrm{S}$ bond length is $1.85 \AA$; the standard ${ }^{21}$ value is $1.82 \AA$.

The tetramethyl formamidinium group exhibits the main features of simple formamidinium compounds. ${ }^{12-20,22,23}$ The valences at the central carbon atom are very nearly coplanar and the $\mathrm{C}(1)-\mathrm{N}$ bond lengths (mean $1.330 \AA$ ) are close to the conjugated heterocyclic value ${ }^{21}(1.339 \AA)$. The equation of the least-squares plane through $\mathrm{P}, \mathrm{C}(1), \mathrm{N}(1)$, and $\mathrm{N}(2)$ is given in Table 5. The distance of the other heavy atoms from this plane are: $\mathrm{O}(1)-1 \cdot 05, \mathrm{O}(2)-0 \cdot 46$, $\mathrm{O}(3) 1 \cdot 42, \mathrm{C}(2)-0.36, \mathrm{C}(3) 0 \cdot 50, \mathrm{C}(4) 0 \cdot 68, \mathrm{C}(5)-0.60 \AA$. The planes of both $\mathrm{NMe}_{2}$ groups pass very close to $\mathrm{C}(1)$ [see planes (B) and (C) in Table 6] and are rotated in opposite senses about their $\mathrm{N}-\mathrm{C}(1)$ bonds relieving nonbonded intramolecular strains. The angle between planes (A) and (B) (Table 5) is $21^{\circ}$ and that between planes (A) and (C) is $32^{\circ}$. Despite these rotations the $C(5)$ and $C(3)$ atoms are quite close to one another $(2.85 ~ \AA)$; associated contacts are $\mathrm{H}(3 \mathrm{C}) \cdots \mathrm{H}(5 \mathrm{~A})$ $2 \cdot 25$, and $\mathrm{H}(3 \mathrm{~A}) \cdots \mathrm{H}(5 \mathrm{~B}) 2 \cdot 32 \AA$.

Table 5
The equations of some weighted ( $w=$ atomic number) least-squares planes in the molecule, in the form $l X^{\prime}+m Y^{\prime}+n Z^{\prime}+p=0 *$

| Plane | Atoms | $l$ | $n$ | $n$ | $p$ | Max. Deviation $(\AA)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | $\mathrm{P}, \mathrm{N}(1), \mathrm{N}(2), \mathrm{C}(1)$ | 0.79580 | 0.58083 | 0.17131 | 1.9482 | $\mathrm{C}(1),-0.013$ |
| B | $\mathrm{C}(1), \mathrm{N}(1), \mathrm{C}(2), \mathrm{C}(3)$ | 0.58204 | 0.81315 | 0.00389 | 0.9875 | $\mathrm{~N}(1),-0.027$ |
| C | $\mathrm{C}(1), \mathrm{N}(2), \mathrm{C}(4), \mathrm{C}(5)$ | 0.64074 | 0.38986 | 0.66141 | 2.9851 | $\mathrm{~N}(2),-0.013$ |

* $X^{\prime}, Y^{\prime}$, and $Z^{\prime}$ are orthogonal co-ordinates in $\AA$ related to $X, Y$, and $Z$ by $X^{\prime}=X+Z \cos \beta, Z^{\prime}=Z \sin \beta$.
$[\mathrm{O}(3)-\mathrm{P}-\mathrm{C}(1)]$ to $120 \cdot 4^{\circ}[\mathrm{O}(1)-\mathrm{P}-\mathrm{O}(3)]$ and the $\mathrm{HO}-\mathrm{P}-\mathrm{C}$ angle $\left(104 \cdot 1^{\circ}\right)$ lies well below the tetrahedral value as it does in $\beta$-ciliatine ${ }^{6}$ and in nitrilomethylene triphosphonic acid. ${ }^{7}$

The phosphorus-carbon bond length is slightly longer than those found in two ${ }^{6,7}$ phosphonic acids ( 1.820 and $1.807 \AA$ ) and than the sum of the single-

[^3]The van der Waals' contacts are mostly of the $\mathrm{O} \cdot \mathrm{H}$, $\mathrm{C} \cdots \mathrm{H}$, or $\mathrm{H} \cdots \mathrm{H}$ types and the shortest in these categories are $2 \cdot 5,2 \cdot 8$, and $2 \cdot 2 \AA$.

I thank Dr. G. Birum who suggested the problem and prepared the crystals.
