# Preparation and Crystal Structure of Aqua[bis(2-hydroxyphenylimino)-ethanato-OO'NN'-]dioxouranium 

By Giuliano Bandoli and Dore A. Clemente,* Laboratorio di Chimica e Tecnologia dei Radioelementi del C.N.R., Via Vigonovese 52, 35100 Padova, Italy

#### Abstract

The preparation and $X$-ray crystal structure of the title complex determined by three-dimensional $X$-ray methods are reported. The blue crystals are monoclinic, space group $P 2_{1} / c$, with cell dimensions: $a=7 \cdot 834$ (9), $b=$ $15 \cdot 483(14), c=11 \cdot 824(13) A, \beta=92 \cdot 65(7)^{\circ}$, and $Z=4$. The structure was solved by the heavy-atom method from 2130 counter reflections, and refined by least-squares methods to $R 0.067$. The uranyl group is surrounded equatorially by a roughly regular pentagon formed by two oxygen and two nitrogen atoms of the Schiff base and by the oxygen atom of a water molecule. The pentagon is slightly puckered around the uranium, only the water oxygen having a significant deviation ( $0 \cdot 12 \AA$ ). Bond lengths and angles are as expected [U-O (apical) $1 \cdot 77(2)$ and $1 \cdot 76(2), \mathrm{U}-\mathrm{O}(\mathrm{eq}) 2 \cdot 33(1)$ and $2 \cdot 37(2), \mathrm{U}-\mathrm{OH}_{2} 2 \cdot 41(1), \mathrm{U}-\mathrm{N} 2 \cdot 53(2)$ and $2 \cdot 54(2) \AA$.

Following previous investigations ${ }^{1}$ on ligands with mixed nitrogen-oxygen donors specially designed to interact with actinide ions of the type $\left[\mathrm{UO}_{2}\right]^{2+}$, we have investigated complexes of uranyl salts with $2,2^{\prime}$-bibenzoxazoline. We wished to ascertain (i) the coordination number in the equatorial plane of this complex which contains three five-membered chelating rings and can be compared with analogous quadridentate Schiffbase complexes also containing six-membered rings, ${ }^{1 a-c}$ (ii) to investigate in the likely presence of small molecules of solvent or water in the equatorial plane, and/or the possible intermolecular bond involved, and (iii) whether the system of condensed rings aids the planarity of the quadridentate molecule in its arrangement in the equatorial plane (the complex has a blue colour, whereas analogous Schiff-base complexes ${ }^{1 a-c}$ are red-yellow).

Preliminary reports have been published. ${ }^{2}$

## EXPERIMENTAL

Preparation.-The complex was obtained from uranyl salts ( $\left[\mathrm{UO}_{2}\right] \mathrm{Cl}_{2}, 3 \mathrm{H}_{2} \mathrm{O}$ or $\left.\left[\mathrm{UO}_{2}\right]\left[\mathrm{NO}_{3}\right]_{2}, 6 \mathrm{H}_{2} \mathrm{O}\right)$ with stoicheiometric amounts of $2,2^{\prime}$-bibenzoxazoline in absolute ethanol at room temperature. Such a ligand reacts with transition metals in the Schiff-base tautomeric form ${ }^{3,4}$ and the $\left[\mathrm{UO}_{2}\right]^{2+}$ ion undergoes similar reaction, according to Scheme:

Scheme:
The tautomeric Schiff-base form is confirmed by the presence in the i.r. spectrum of $v(\mathrm{C}=\mathrm{N})$ stretch bands ( 1585
and $1578 \mathrm{~cm}^{-1}$ ) and, consequently, by the relative absence of the $v(\mathrm{NH})$ stretch band present for the free ligand at 3370 $\mathrm{cm}^{-1}$. The ${ }^{1} \mathrm{H}$ n.m.r. spectrum is also consistent with this formulation (Found: C, $32.05 ; \mathrm{H}, 2.45 ; \mathrm{N}, 5 \cdot 45$. Calc. for $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{U}$ : C, $\left.31.95 ; \mathrm{H}, 2 \cdot 30 ; \mathrm{N}, 5 \cdot 32 \%\right)$. The co-ordinated water undergoes substitution in solution with unidentate ligands such as pyridine, $\mathrm{PhNH}_{2}, \mathrm{Me}_{2} \mathrm{SO}$, and $\mathrm{Ph}_{3} \mathrm{PO}$ under mild conditions.

Crystal Data. $-\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{U}, M=526 \cdot 3$, Monoclinic, $a=$ $7 \cdot 834(9), b=15 \cdot 483(14), c=11 \cdot 824(13) \AA, \beta=92 \cdot 65(7)^{\circ}$, $U=1432 \cdot 6 \AA^{3}, D_{\mathrm{m}}=2 \cdot 45$ (by flotation), $Z=4, D_{\mathrm{c}}=2 \cdot 44$ $\mathrm{g} \mathrm{cm}^{-3}, F(000)=1024 . \quad \mathrm{Cu}-K_{\alpha}$ radiation, $\lambda=1.54178 \AA$; $\mu\left(\mathrm{Cu}-K_{\alpha}\right)=445 \cdot 9 \mathrm{~cm}^{-1}$. Space group $P 2_{1} / c$. Crystal dimensions: $0.09 \times 0.05 \times 0.07 \mathrm{~mm}^{3}$.

Data were collected on a Siemens AED automated fourcircle diffractometer with nickel-filtered $\mathrm{Cu}-K_{\alpha}$ radiation and a $\mathrm{Na}(\mathrm{Tl}) \mathrm{I}$ scintillation counter. Lattice and orientation parameters were derived by use of the Busing and Levy procedure ${ }^{5}$ on 30 reflections. In the reciprocal space corresponding to $2 \theta=120^{\circ}$ there are 2130 non-equivalent lattice sites, of which 1836 were considered observed having $I>2 \sigma(I) .{ }^{6}$ Also, all reflections were remeasured with the same tube-current setting; the $\left|F_{o}\right|$ data were the best least-squares values derived from the two sets of measurements, by the method of Hamilton, Rollett, and Sparks. ${ }^{\top}$ The scale of the $\left|F_{0}\right|$ data and the overall temperature factor were estimated from a Wilson plot.

Solution and Refinement of the Structure.-An unsharpened threc-dimensional Patterson revealed the position of the uranium atom, refinement of which gave $R 0 \cdot 17$. An elec-tron-density difference synthesis, based upon the uranium signs, revealed the positions for all 21 non-hydrogen atoms;

three least-squares cycles with the neutral atom scattering factors of ref. 8, and the weighting scheme of ref. 9 and isotropic temperature factors, reduced $R$ to $0 \cdot 10$. A weighting scheme based on counter statistics was unsuccessful. ${ }^{10}$

A weighting function $w^{-1}=A\left|F_{\mathrm{o}}\right|^{2}+B\left|F_{\mathrm{o}}\right|+C$ with $A=0.0004, B=1 \cdot 0, C=40$ was checked by plotting $w\left(\left|F_{0}\right|-\left|F_{\mathrm{c}}\right|\right)^{2}$ vs. $\left|F_{0}\right|$. At this stage, anisotropic temperature factors of the form, $\exp \left[-0 \cdot 25\left(B_{11} a^{* 2} h^{2}+B_{22}\right]^{* 2} k^{2}+\right.$ $\left.\left.B_{33} c^{* 2} l^{2}+2 B_{12} a^{*} b^{*} h k+2 B_{13} a^{*} c^{*} h l+2 B_{23} b^{*} c^{*} k l\right)\right]$, were assigned to the uranium atom and refinement of the structure proceeded to $R 0.067$ with the full-matrix least-squares method. A difference-Fourier map computed at this stage showed few peaks up to a maximum of $2 \cdot 1 \mathrm{e}^{-3}$ in the vicinity of the uranium atom position, whilst elsewhere peaks were $<0.7 \mathrm{e}^{-3}$, occurring in some cases at positions expected for hydrogen atoms. We attempted to apply geometrical and experimental absorption corrections, but no significant improvement over refinement was observed.

Observed and calculated structure factors are listed in Supplementary Publication No. SUP 21240 ( 11 pp., 1 microfiche). $\dagger$ Final atomic positional and thermal parameters are given in Table 1, bond lengths and angles, and details of selected planes within the molecule in Tables 2 and 3. Standard deviations for the atomic parameters are derived from the full-matrix least-squares program.

The solution and refinement of the structure were carried out by the use of the Crystal Structure Calculations System ' $X$-Ray ' $70^{\prime}$ '11 with calculations on the Consorzio Interuniversitario dell'Italia Nord-Orientale, Casalecchio (Bologna), CDC 6600 computer.

Schiff base and the water oxygen atom (Figure 1). This pentagon is only slightly puckered around the uranium, only the water oxygen having any significant deviation ( $-0.12 \AA$ ) from the least-squares plane through the $U$ and the other four atoms [Table 3, plane (2)].

The basic features of the structure closely resemble those of similar compounds, ${ }^{1 a-c}$ containing mixed five- and six-membered chelating rings, at least as far as the co-ordination geometry is concerned. In fact the apical U-O distances $[1 \cdot 77(2)$ and $1 \cdot 76(2) \AA]$ are as expected considerably shorter than the equatorial $\mathrm{U}-\mathrm{O}$ distances $[2 \cdot 33(1), 2 \cdot 37(2)$, and $2 \cdot 41(1) \AA]$. Furthermore,

[^1]from consideration of previous uranyl structure determinations, the $\mathrm{U}-\mathrm{N}\left(s p^{2}\right)$ bond lengths [2.53(2) and $2 \cdot 54(2) \AA]$ are as expected and longer than the $\mathrm{U}-\mathrm{O}$

equatorial distances [for a complete list see Table 7 of ref. $1(c)]$.
However, the most interesting feature of the complex is that it is almost planar. The only significant deviations [plane (6) of Table 3] involving one benzene ring [ $\mathrm{C}(9)-(14)]$. This planarity is due to the fact that the planarity of the ligand is required for co-ordination; the planar tautomeric quadridentate Schiff-base form of $2,2^{\prime}$-bibenzoxazoline has all three ' bites' of $c a \cdot 2 \cdot 7 \AA$
(estimated assuming ' normal ' bond lengths and angles), values very close to those after co-ordination [part (c) of Table 2]. The lack of planarity of the C(9)-(14)

Figure 1 Projection of the molecule on the mean molecular plane; $O(1)$ and $O(2)$ omitted for clarity. The atom numbering system used in the analysis is shown
benzene ring is therefore due not to co-ordination, but to packing effects.
In order to clarify this feature further, it is necessary to consider the packing of the molecules (Figure 2): the

Figure 2 Arrangement of the molecules in the unit cell viewed along the $c^{*}$ axis; dashed lines show hydrogen bonding
co-ordinated water molecule is hydrogen-bonded to two oxygen atoms of two adjacent molecules ( $\mathrm{O} \cdots \mathrm{O} 2 \cdot 61$ and $2.68 \AA, \mathrm{O} \cdots \mathrm{HOH} \cdots \mathrm{O} 101 \cdot 5^{\circ}$, Table 4). Thus, in order to form the highest number of hydrogen bonds, two different molecules are constrained to approach each other as shown in Figures 3 and 4. This overlap, which
brings one uranyl oxygen atom in a direction perpendicular to the $C(9)-(14)$ benzene ring, brings this ring out of

Table 4

\mathrm{O}\left(4^{\mathrm{II}}\right) & 101 \cdot 5^{\circ} \\
\mathrm{O}\left(3^{\mathrm{II}}\right) \cdots \mathrm{O}(5) & \cdots & \mathrm{O}(5) & \cdots \mathrm{U} \\
& 117 \cdot 8^{\circ} & 140 \cdot 6^{\circ}
\end{array}
$$

the molecular plane (6). In fact, if the whole molecule were planar, so that the $C(9)$-(14) benzene ring were constrained in the molecular plane (6), the distance

Figure 3 Projection of two molecules at $x, y, z$, and $1+x, y, z$ (III) towards the $\mathrm{U}-\mathrm{O}(5)$ bond $[\mathrm{O}(5)$ omitted for clarity]. Relative heights in $\AA$ are shown
between the uranyl $\mathrm{O}(2)$ atom and the $\mathrm{C}\left(12^{\text {III }}\right)$ atom would become impossibly short ( $1 \cdot 3 \AA$, Figure 3 ). The molecule is therefore not strictly planar, the angle

Figure 4 Projection of the three molecules at $x, y, z, \bar{x}, y, \bar{z}(\mathrm{I})$ and $1-x, \bar{y}, \bar{z}$ (II) on the mean molecular plane; dashed lines denote hydrogen bonding and the arbitrary thicknesses of the atoms represent their respective levels from the observer's point of view. $\mathrm{O}\left(4^{1}\right) \cdots \mathrm{O}(5) 2 \cdot 61, \mathrm{O}\left(3^{\mathrm{II}}\right) \cdots \mathrm{O}(5) 2 \cdot 68 \AA$
between the normals to planes (4) and (6) being $15.5^{\circ}$ (Table 3). The crystal energy is mainly due to the threedimensional network of hydrogen bonds, which has grown at the expense of little distortions in the molecular geometry. This, as far as we are aware, is the first Schiff-base complex to be coloured blue, other similar complexes being yellow or red-yellow. ${ }^{1}$ We consider the blue colour to be due to the mesomerism of the coordinated organic ligand, and the presence of an almost planar system of conjugated double bonds.

We thank F. Benetollo for allowing us use of the automatic diffractometer.
