# Crystal Structure of Potassium Tetra-acetatoborate 

By Alberto Dal Negro and Giuseppe Rossi, Centro di Studio del C.N.R. per la Cristallografia Strutturale Istituto di Mineralogia dell'Università, and Angelo Perotti, Istituto di Chimica Generale dell'Università, 27100 Pavia, Italy

The crystal structure of the title compound has been solved by direct methods from three-dimensional $X$-ray diffractometer data and refined by least-squares methods to $R 0.075$ for 848 observed reflections. All hydrogen atoms were located. Crystals are monoclinic, space group $P 2_{1} / n$, with $a=17 \cdot 665(2), b=12 \cdot 456(2), c=6 \cdot 090$ (3) $\AA, \beta=100 \cdot 11^{\circ}, Z=4$. The structure consists of slightly distorted boron-oxygen tetrahedra held together by potassium ions. Four acetoxy-groups with only one B-O bond form each boron-oxygen tetrahedron of the anionic unit $\mathrm{B}(\mathrm{OAc})_{4}{ }^{-}$. The potassium ion is co-ordinated to seven oxygen atoms, with $\mathrm{K}-\mathrm{O}$ distances 2.68 $3.02 \AA$, so that all but one of the oxygen atoms of each anionic unit are linked to $K+$ ions. The eighth is far removed.

There has been recently considerable interest in the boron acetates and their derivatives with acetates of several cations. ${ }^{1}$ We have previously ${ }^{2}$ reported the crystal and molecular structure of the tetra-acetyldiborate. To find out more of the co-ordination chemistry and crystallo-chemical behaviour of boron, ${ }^{3}$ we have carried out and report here the crystal structure of potassium tetra-acetatoborate.

## EXPERIMENTAL

Crystal Data.- $\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{BKO}_{8}, \quad M=286.08$, Monoclinic, $a=17 \cdot 665(2), b=12 \cdot 456(2), c=6.090(3) \AA, \beta=100 \cdot 11$ $(0 \cdot 1)^{\circ}, U=1319 \AA^{3}, Z=4, D_{\mathrm{c}}=1.438 \mathrm{~g} \mathrm{~cm}^{-3}, F(000)=$ 592. Space group $P 2_{1} / n$ from systematic absences: $0 k 0$ with $k$ odd, and $h 0 l$ with $(h+l)$ odd. Mo- $K_{\alpha}$ radiation, $\lambda=0.7107 \AA ; \mu\left(\mathrm{Mo}-K_{\alpha}\right)=4.26 \mathrm{~cm}^{-1}$.

Preparation of the Crystals.-Acetic anhydride ( 20 ml ) was added to orthoboric acid ( 3.05 g ) and heated under nitrogen on a steam-bath, until all solid had dissolved. Anhydrous potassium acetate ( 4.9 g ) was then added and the mixture heated, after addition of further acetic anhydride ( $15-20 \mathrm{ml}$ ), until a clear solution was obtained. From this solution colourless, prismatic crystals, suitable for $X$-ray investigation were obtained after some months. They were air-sensitive and many were twinned; a prismatic crystal, elongated along $c$, with dimensions $c a$. $0.1 \times 0.03 \times 0.5 \mathrm{~mm}$ was mounted in a capillary which was sealed after addition of mother liquor.

Intensity Data.-Intensity data were measured with a Philips PW 1100 computer-controlled automatic diffractometer, by use of $\mathrm{Mo}-K_{\alpha}$ radiation monochromatized with a

graphite crystal. Cell dimensions were determined by the least-squares method from 20 high-angle reflections by use of monochromatic $\mathrm{Cu}-K_{\alpha}$ radiation $(\lambda=1.5418 \AA)$. Intensities were measured by $\omega$-scans, scan rate $0.1^{\circ} \mathrm{s}^{-1}$, scan range $1^{\circ}$. The background time was half the scanning time. Rapid data collection was necessary because of crystal instability. (An attempt to use a lower scan-speed failed because the crystal decomposed before a sufficient number of reflections had been collected.)

All reflections in the quadrant of reciprocal space $\pm h, k, l$ (with $l<5$ ) were collected to $2040^{\circ}$. Of 1127 independent reflections obtained, 848 having $I>\sigma(I)$ were processed. ${ }^{4}$

Structure Determination and Refinement.-The structure was solved by direct methods, with the MULTAN program. ${ }^{5}$ The potassium and all the oxygen atoms were located from the $E$ map. ${ }^{6}$ With these co-ordinates, successive three-dimensional Fourier syntheses revealed the positions of all the carbon atoms. These parameters were then refined, first isotropically ( 3 cycles), then anisotropically ( 2 cycles) by full-matrix least-squares calculations, ${ }^{7}$ yielding $R^{\prime} 0.051$. The weighting scheme used throughout refinement was: $\sqrt{ } w=1 / \sigma\left(F_{0}\right)$.
A difference-Fourier synthesis gave the positions of all the hydrogen atoms. A structure-factor calculation, taking into account the hydrogen atoms (for which the methyl-carbon isotropic thermal parameter was used), and a further cycle of anisotropic refinement for all the non-hydrogen atoms, yielded a final $R^{\prime}$ of 0.039 and $R 0.075$ for all observed reflections.
Atomic scattering factors used in the structure-factor

atomic and thermal parameters for non-hydrogen atoms are listed in Tables 1 and 2, and positional parameters for hydrogen atoms in Table 3.

## DISCUSSION

Figure 1 shows the crystal structure and the tetrahedral environment of the boron atom. Each boronoxygen tetrahedron, which forms the basic unit of the $\left[\mathrm{B}(\mathrm{OAc})_{4}\right]^{-}$anion, is built up by a boron atom bonded to four oxygen atoms, one from each acetoxy-group. In the $\mathrm{BO}_{4}$ tetrahedron the $\mathrm{B}-\mathrm{O}$ distances (mean

Figure 1 Projection down $c$ of the unit-cell contents. Boron atoms (not drawn) are in the centre of each tetrahedron
$1 \cdot 472 \AA$ ) and the $\mathrm{O}-\mathrm{B}-\mathrm{O}$ angles (Table 4; mean $109.5^{\circ}$ ) are as expected for such an environment, but $\mathrm{O}(1)-\mathrm{B}-\mathrm{O}(2)$ and $\mathrm{O}(3)-\mathrm{B}-\mathrm{O}(4)$ are significantly less than the mean ( $103 \cdot 1$ and $102 \cdot 3^{\circ}$ ). This is because the two pairs of oxygen atoms [i.e. $\mathrm{O}(1)$ and $\mathrm{O}(2)$, and $\mathrm{O}(3)$ and $\mathrm{O}(4)$ ] are oppositely attracted by two different potassium atoms (Figures 2 and 3 ); consequently the other $\mathrm{O}-\mathrm{B}-\mathrm{O}$ angles are enlarged and the tetrahedron slightly distorted.

The $\mathrm{B}-\mathrm{O}$ and $\mathrm{C}-\mathrm{O}$ bond lengths are interdependent and also sensitive to the $\mathrm{K}-\mathrm{O}$ distances: $\mathrm{C}(1)-\mathrm{O}(\mathbf{1})$ is the longest, and $\mathrm{K}-\mathrm{O}(1)$ is the shortest of the $\mathrm{K}-\mathrm{O}$ distances involving oxygen atoms of the $\mathrm{BO}_{4}$ tetrahedron; $\mathrm{B}-\mathrm{O}(\mathbf{1})$ is one of the longest $\mathrm{B}-\mathrm{O}$ distances.

[^1] Cryst., 1964, 17, 1041.

The shortest of the $\mathrm{C}-\mathrm{O}$ bonds is $\mathrm{C}(4)-\mathrm{O}(4)$, whereas $\mathrm{B}-\mathrm{O}(4)$ is the longest $\mathrm{B}-\mathrm{O}$ bond, and $\mathrm{K}-\mathrm{O}(4)$ is longer

Figure 2 Clinographic projection of the unit cell showing the potassium co-ordination. Primed atoms are at $x, y, 1+z$, and double primed atoms at $\frac{1}{2}-x, y-\frac{1}{2}, \frac{3}{2}-z$
than $\mathrm{K}-\mathrm{O}(1)$. Finally, $\mathrm{C}(2)-\mathrm{O}(2)$ and $\mathrm{C}(3)-\mathrm{O}(3)$ have the same length, intermediate between $\mathrm{C}(1)-\mathrm{O}(1)$ and $\mathrm{C}(4)-\mathrm{O}(4)$, since although $\mathrm{B}-\mathrm{O}(2)$ is shorter than $\mathrm{B}-\mathrm{O}(3)$, $\mathrm{K}-\mathrm{O}(2)$ is longer than $\mathrm{K}-\mathrm{O}(3)$. Whereas all the oxygen atoms of the $\mathrm{BO}_{4}$ tetrahedron are also co-ordinated to the potassium, only three of every four carbonyl oxygen atoms of the acetoxy-groups are involved in such co-ordination. The $\mathrm{C}=\mathrm{O}$ bond lengths are therefore mainly related to the $\mathrm{K}-\mathrm{O}$ distances: $\mathrm{O}(8)$, which does not co-ordinate to potassium, forms the shortest
$(1 \cdot 183 \AA) \mathrm{C}=\mathrm{O}$ bond; $\mathrm{O}(5)$ and $\mathrm{O}(6)$ which form long and nearly equal $\mathrm{C}=\mathrm{O}$ bonds $[\mathrm{C}(1)=\mathrm{O}(5)$ and $\mathrm{C}(4)=\mathrm{O}(6)]$ also have the shortest $\mathrm{K}-\mathrm{O}$ contacts. The $\mathrm{C}(3)=\mathrm{O}(7)$ bond ( $1 \cdot 198 \AA$ ) is intermediate in length, close to the accepted value for organic carboxylic acids. ${ }^{9}$ In general we conclude that the shorter $\mathrm{K}-\mathrm{O}$, the longer is the corresponding $\mathrm{C}=\mathrm{O}$ distance, and vice versa.

The $\mathrm{C}-\mathrm{C}$ are mainly dependent on $\mathrm{C}=\mathrm{O}$ bond lengths, the longest and shortest of each corresponding: i.e. $\mathrm{C}(2)-\mathrm{C}(6)$ with $\mathrm{C}(2)=\mathrm{O}(8), \mathrm{C}(1)-\mathrm{C}(5)$ with $\mathrm{C}(1)=\mathrm{O}(5)$, and $\mathrm{C}(4)-\mathrm{C}(8)$ with $\mathrm{C}(4)=\mathrm{O}(6)$.

Bond angles involving oxygen and carbon atoms for the acetoxy-groups are listed in Table 4; the acetoxygroups are nearly planar, with a maximum deviation

Table 5
(a) Equation * of planes through acetoxy-groups, in the form $A x+B y+C z=D$

| A | $B$ | C | D |
| :---: | :---: | :---: | :---: |
| Plane (1) |  |  |  |
| $\mathrm{O}(1), \mathrm{O}(5), \mathrm{C}(1), \mathrm{C}(5)$ |  |  |  |
| -1.9270 | $12 \cdot 2657$ | $-0.6971$ | $9 \cdot 0009$ |
| Plane (2) |  |  |  |
| $\mathrm{O}(2), \mathrm{O}(8), \mathrm{C}(2), \mathrm{C}(6)$ |  |  |  |
| $1 \cdot 6939$ | $12 \cdot 3714$ | $-0.4977$ | $10 \cdot 3139$ |
| Plane (3) |  |  |  |
| $\mathrm{O}(3), \mathrm{O}(7), \mathrm{C}(3), \mathrm{C}(7)$ |  |  |  |
| $-15.9582$ | 5-2252 | $1 \cdot 4996$ | $2 \cdot 4861$ |
| Plane (4) |  |  |  |
| $\mathrm{O}(4), \mathrm{O}(6), \mathrm{C}(4), \mathrm{C}(8)$ |  |  |  |
| $-16.0575$ | $5 \cdot 1200$ | $0 \cdot 5579$ | $1 \cdot 6293$ |

(b) Deviations $(\AA)$ of atoms from planes

Plane (1): $O(1)-0.002(4), O(5)-0.002(4), C(1) 0.006(6)$, $\mathrm{C}(5)-0.002(7)$
Plane (2): $O(2)-0.003(4), O(8)-0.004(5), C(2) 0.009(7)$, $C(6)-0.002(7)$
Plane (3): $\mathrm{O}(3) 0.001(4), \mathrm{O}(7) 0.001(4), \mathrm{C}(3)-0.001(6), \mathrm{C}(7)$ 0.001(7)

Plane (4): $\mathrm{O}(4) 0.002(4), \mathrm{O}(6) 0.003(4), \mathrm{C}(4)-0.007(6), \mathrm{C}(8)$ $0.002(7)$

* $x, y, z$ are the fractional co-ordinates of the atoms, and $D$ is the distance $(\AA)$ of the planes from the origin.
from the plane of $0.009(7) \AA$ (Table 5). Interatomic distances and bond angles involving hydrogen atoms are listed in Table 6.

The Potassium Co-ordination.-Each $\mathrm{K}^{+}$ion is linked (Figure 2) to three anionic units as follows: to one via a carbonyl oxygen $\left[O\left(7^{\prime \prime}\right)\right]$, and to the second and third
${ }^{9}$ See e.g., J. Sime, J. C. Speakman, and R. Parthasaraty, J. Chem. Soc. (A), 1970, 1919.
via two oxygen atoms of the $\mathrm{BO}_{4}$ tetrahedron $[\mathrm{O}(1)$, $\mathrm{O}(2)$ and $\left.\mathrm{O}\left(3^{\prime}\right), \mathrm{O}\left(4^{\prime}\right)\right]$ and one carbonyl oxygen $[\mathrm{O}(6)$

Table 6
Geometry of $\mathrm{C}-\mathrm{H}$ bonds
(a) Distances $(\AA)$

| $\mathrm{C}(7)-\mathrm{H}(1)$ | 1.00 |
| :--- | :--- |

$\begin{array}{lr}\mathrm{H}(7)-\mathrm{C}(8)-\mathrm{H}(9) & 99 \cdot 9 \\ \mathrm{H}(8)-\mathrm{C}(8)-\mathrm{H}(9) & 98.6\end{array}$
$\mathrm{C}(4)-\mathrm{C}(8)-\mathrm{H}(7) \quad 116.3$
$\begin{array}{ll}\mathrm{C}(4)-\mathrm{C}(8)-\mathrm{H}(8) & 118 \cdot 4\end{array}$
$\mathrm{C}(4)-\mathrm{C}(8)-\mathrm{H}(9)$

| $\mathrm{C}(6)-\mathrm{H}(4)$ | $1 \cdot 01$ |
| :--- | :---: |
| $\mathrm{C}(6)-\mathrm{H}(5)$ | $1 \cdot 01$ |
| $\mathrm{C}(6)-\mathrm{H}(6)$ | 0.99 |
| $\mathrm{C}(5)-\mathrm{H}(10)$ | 0.98 |
| $\mathrm{C}(5)-\mathrm{H}(11)$ | 1.10 |
| $\mathrm{C}(5)-\mathrm{H}(12)$ | 1.02 |
|  |  |
| $\mathrm{H}(4)-\mathrm{C}(6)-\mathrm{H}(5)$ | $104 \cdot 3$ |
| $\mathrm{H}(4)-\mathrm{C}(6)-\mathrm{H}(6)$ | 127.5 |
| $\mathrm{H}(5)-\mathrm{C}(6)-\mathrm{H}(6)$ | $105 \cdot 4$ |
| $\mathrm{C}(2)-\mathrm{C}(6)-\mathrm{H}(4)$ | $108 \cdot 8$ |
| $\mathrm{C}(2)-\mathrm{C}(6)-\mathrm{H}(5)$ | 97.2 |
| $\mathrm{C}(2)-\mathrm{C}(6)-\mathrm{H}(6)$ | $109 \cdot 2$ |
| $\mathrm{H}(10)-\mathrm{C}(5)-\mathrm{H}(11)$ | 107.5 |
| $\mathrm{H}(10)-\mathrm{C}(5)-\mathrm{H}(12)$ | $104 \cdot 3$ |
| $\mathrm{H}(11)-\mathrm{C}(5)-\mathrm{H}(12)$ | $95 \cdot 0$ |
| $\mathrm{C}(1)-\mathrm{C}(5)-\mathrm{H}(10)$ | $116 \cdot 6$ |
| $\mathrm{C}(1)-\mathrm{C}(5)-\mathrm{H}(11)$ | $110 \cdot 2$ |
| $\mathrm{C}(1)-\mathrm{C}(5)-\mathrm{H}(12)$ | $120 \cdot 6$ |

and $\left.\mathrm{O}\left(5^{\prime}\right)\right]$. Each potassium atom thus has sevenfold co-ordination; one oxygen atom for every anionic unit [ $\mathrm{O}(8)$ ] does not participate in the potassium co-ordination. The minimum $\mathrm{K} \cdots \mathrm{O}(8)$ contact is $5 \cdot 00 \AA$.

This co-ordination is strictly related to the $\mathrm{BO}_{4}$ tetrahedra and to the acetoxy-groups' geometry. The $\mathrm{O}-\mathrm{K}-\mathrm{O}$ angles involving oxygen atoms which both belong to acetoxy-groups co-ordinated to the same boron
atom are thus the smallest. Furthermore, the smallest among them $\left[\mathrm{O}(1)-\mathrm{K}-\mathrm{O}(2) \quad 46 \cdot 7\right.$ and $\mathrm{O}\left(3^{\prime}\right)-\mathrm{K}-\mathrm{O}\left(4^{\prime}\right)$ $47 \cdot 1^{\circ}$ ] result because $\mathrm{O}(1), \mathrm{O}(2)$ and $\mathrm{O}\left(3^{\prime}\right), \mathrm{O}\left(4^{\prime}\right)$ belong to two $\mathrm{BO}_{4}$ tetrahedra (Figure 3) in which the $\mathrm{O} \cdots \mathrm{O}$ distances are necessarily small.

Figure 3 Potassium co-ordination pattern (in the same orientation as the clinographic projection of Figure 2)

As a result, the potassium co-ordination pattern consists of a ten-faced polyhedron, which can be considered as being derived from a highly distorted octahedron in which a vertex is split to give two vertices, namely $O(2)$ and $O\left(3^{\prime}\right)$. The base is formed by the vertices $O(1), O(6), O\left(4^{\prime}\right)$, and $O\left(5^{\prime}\right)$, and the apical vertex is $O\left(7^{\prime \prime}\right)$.
