#### Abstract

$N, N, N^{\prime}, N^{\prime}$-Tetraethylbenzene-1,3-bis(methylamine) (L) undergoes regiospecific double cyclopalladation with $\mathrm{Li}_{2}\left[\mathrm{PdCl}_{4}\right]$ at the 4,6 positions of the benzene ring to produce the chloro-bridged polymeric complex $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right]$. Reactions of this complex with $\mathrm{PPh}_{3}$, methylpyridines, acetylacetone, ethylacetoacetate, monothiodibenzoylmethane and trifluoro(thenoyl) acetone have been studied and the products characterized by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy. Treatment of $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$ with $\mathrm{MeCO}_{2} \mathrm{H}$ and LiCl produces at room temperature the nitrogen-protonated species $\left[\mathrm{Pd}_{2} \mathrm{~L}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{4}\right]$, but trans$\left[\mathrm{Pd}_{2}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{4}\right]$ and the metal-free ligand (L) are formed at $80^{\circ} \mathrm{C}$. The complex $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right]$ undergoes exchange reaction with ligands capable of forming monocyclopalladated coinplexes. The crystal structure of $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$ has been determined: monoclinic, space group $C 2 / c$, $a=20.676(4), b=12.436(3), c=19.445(4) \AA, \beta=104.29(3)^{\circ}$ and $Z=4$; refinement led to $R=0.035$ and $R^{\prime}=0.043$ using 3533 unique reflections with $/>2 \sigma(I)$.

The chemistry of $\mathrm{C}^{-}, \mathrm{N}$-chelated cyclopalladated compounds has received sustained attention ${ }^{1,2}$ over the past two decades. The focus of attention has ranged from exploring substrates that may be subjected to cyclometallation reaction to the reactivities of these compounds and their applications in organic synthesis. ${ }^{3-5}$

Orthopalladated complexes constitute the major bulk of known palladocycles. Double cyclometallation occurring at two different phenyl rings of azobenzene, ${ }^{6,7}$ benzalazines, ${ }^{8} 4,6$ diphenylpyrimidine ${ }^{9}$ and 2-phenyl-4,6-bis(pyrazolylmethyl)pyrimidine ${ }^{10}$ have also been reported. However, whether two different sites of the same benzene ring can be involved in double cyclometallation reaction has so far received far less attention. Trofimenko ${ }^{11}$ was the first to explore this possibility and briefly reported doubly orthopalladated compounds of $N, N, N^{\prime}, N^{\prime}$ -tetraalkyl-p-(or $-m$ )xylene- $\alpha, \alpha^{\prime}$-diamines. We have recently made extensive studies ${ }^{12}$ on the dipalladiobenzene derivatives of $N, N^{\prime}$-dialkylbenzene-1,3-dicarbaldimines $\left(\mathrm{L}^{\prime}\right)$ and have reported the structures of $\left[\mathrm{Pd}_{2}\left(\mathrm{~L}^{\prime}-2 \mathrm{H}\right)(\mathrm{py})_{4}\right] \mathrm{Cl}_{2}{ }^{12 a}$ and $\left[\mathrm{Pd}_{2}\left(\mathrm{~L}^{\prime}-2 \mathrm{H}\right)(\mathrm{btac})_{2}\right]^{12 \mathrm{c}}\left[\right.$ alkyl $=$ ethyl $\left(\mathrm{L}^{\prime}\right), \mathrm{py}=$ pyridine, Hbtac $=$ benzoyltrifluoroacetone]. Phillips and Steel ${ }^{13}$ have also recently observed that $1,3-$ and 1,4 -diacetylbenzene dioximes undergo double cyclopalladation reaction. The present study is concerned with the reactions of the chlorobridged doubly orthopalladated complex $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right]$ of $N, N, N^{\prime}, N^{\prime}$-tetraethylbenzene-1,3-bis(methylamine) (L). The structure of $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$ is also reported.

## Results and Discussion

Cyclometallation Reaction.- $N, N, N^{\prime}, N^{\prime}$-Tetraethylbenzene-1,3-bis(methylamine) on reaction with 2 equivalents each of $\mathrm{Li}_{2}\left[\mathrm{PdCl}_{4}\right]$ and $\mathrm{NEt}_{3}$ in methanol afforded the doubly cyclometallated compound $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right] 1$ in nearly quantitative yield. When this reaction was carried out in the absence of $\mathrm{NEt}_{3}$ a mixture of 1 and a non-cyclometallated

[^0]
polymeric product $\left[\mathrm{Pd}_{2} \mathrm{LCl}_{4}\right]$ was obtained in an overall yield of $60 \%$. Complex 1 , which is insoluble in common organic solvents, is also polymeric. Its IR spectrum showed two $v(\mathrm{Pd}-\mathrm{Cl})$ vibrations at 330 and $260 \mathrm{~cm}^{-1}$. Although dipalladation of the diamine was possible at either the 4,6 or 2,4 positions, subsequent reactions of the chloro-bridged complex with monodentate donors (see later) disclosed that the 4,6 isomer was formed regiospecifically. Apparently, reaction at the 2,4 positions is sterically more demanding. Attempts to restrict the cyclopalladation reaction to the 4 or 6 position were unsuccessful, indicating that both of these $\mathrm{C}-\mathrm{H}$ bonds are equally activated towards electrophilic attack of palladium. Exclusive metallation at the 2 position of benzene-1,3-bis(methylamines) was achieved ${ }^{14}$ through a different synthetic approach.

The chloro bridges of complex 1 can be substituted by other halides or bridging anions. Thus, complexes of composition $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{X}_{2}\right]\left(\mathrm{X}=\mathrm{Br} 2, \mathrm{~N}_{3} 3\right.$ or NCS 4) were obtained by treating a suspension of 1 in MeCN with the stoichiometric amount of $\mathrm{Ag}\left[\mathrm{ClO}_{4}\right]$ followed by the addition of an aqueous solution of the appropriate alkali-metal salt. The presence of $v_{\text {asym }}\left(\mathrm{N}_{3}^{-}\right)$at $2080 \mathrm{~cm}^{-1}$ for 3 and $v\left(\mathrm{NCS}^{-}\right)$at $2050 \mathrm{~cm}^{-1}$ for 4 confirmed the involvement of these anions in the bridge formation. ${ }^{15}$

Reactions of Complex 1 with Mono- and Bi-dentate Ligands.A suspension of $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right]$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ on treatment with 2 equivalents of $\mathrm{PPh}_{3}$ readily turned into a clear solution from which the bis(phosphine) complex $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2^{-}}\right.$ $\mathrm{Cl}_{2}$ ] 5 was isolated almost quantitatively. The relative molecular mass of this non-electrolytic compound determined in $\mathrm{CHCl}_{3}$ (1040) was in agreement with that required (1055) for 5. The IR spectrum, in contrast to 1 , showed a single $v(\mathrm{Pd}-\mathrm{Cl})$ at $280 \mathrm{~cm}^{-1}$. There are three possible ways to juxtapose the $\mathrm{PPh}_{3}$

1

5

Scheme 1

7
molecules and Cl atoms in 5: (i) each of the $\mathrm{PPh}_{3}$ is trans to a nitrogen, i.e. they are in the endo position; (ii) each of the $\mathrm{PPh}_{3}$ is trans to a Pd-C bond, i.e. they are in the exo position; (iii) a situation midway between (i) and (ii), i.e. the donor atoms are in the sequence $\mathrm{P}, \mathrm{Cl}, \mathrm{P}, \mathrm{Cl}$. A symmetric structure was indicated by a single resonance at $\delta 35.2$ in the ${ }^{31} \mathrm{P}$ NMR spectrum. The ${ }^{1} \mathrm{H}$ NMR spectrum showed a triplet at $\delta 5.52$ and a singlet at $\delta 6.70$, each of which corresponded to a single proton. The more shielded one can be assigned to $5-\mathrm{CH}$ because this proton experiences maximum anisotropic shielding by the neighbouring $\mathrm{PPh}_{3}$ molecules. The triplet splitting pattern of this proton also arises due to its coupling (through space) with the two adjacent ${ }^{31} \mathrm{P}$ nucleus. The coupling constant, $J(\mathrm{P}-\mathrm{H})=5.5 \mathrm{~Hz}$, may be compared with $J(\mathrm{P}-\mathrm{H})=4.0 \mathrm{~Hz}$ observed for the cyclopalladated complex of 8-methylquinoline. ${ }^{16}$ The singlet at $\delta 6.70$ is obviously due to $2-\mathrm{CH}$. Details of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of this and the other complexes are given in the Experimental section.

The formation of complex 5 from 1 (Scheme 1) is based on the simple rationale that the nucleophilic attack of $\mathrm{PPh}_{3}$ leads to cleavage of the chloro bridge trans to the $\mathrm{Pd}-\mathrm{N}$ bond. It may be noted that neither the alternative structure for 1 involving metallation at the 2,4 positions nor a dimeric 4,6 species would produce a single isomer for 5 .

The chloride ions in complex 5 can be readily substituted with other anions $\left(\mathrm{Br}^{-}, \mathrm{N}_{3}{ }^{-}, \mathrm{NCS}^{-}\right.$, etc. $)$. For example, $\left[\mathrm{Pd}_{2^{-}}\right.$ $\left.(\mathrm{L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2}\left(\mathrm{~N}_{3}\right)_{2}\right] 6$ was obtained either by treating 3 directly with $\mathrm{PPh}_{3}$ or by treating 5 with $\mathrm{Ag}\left[\mathrm{ClO}_{4}\right]$ in MeCN followed by $\mathrm{NaN}_{3}$. Complex 6 showed characteristic $v_{\text {asym }}\left(\mathrm{N}_{3}{ }^{-}\right.$) and $v_{\text {sym }}\left(\mathrm{N}_{3}{ }^{-}\right)$vibrations due to terminal azide ${ }^{15}$ at 2040 and $1340 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum was again almost identical with that of 5 . In contrast to $\mathrm{PPh}_{3}, o$-tolylphosphine failed to give a definite reaction product with 1 . As will be evident from the molecular structure of 5 (see later) this is due to steric overcrowding.

Monodentate nitrogen donors such as 3- and 4-methylpyridine ( 3 Me - or $4 \mathrm{Me}-\mathrm{py}$ ) reacted with complex 1 in the same way as did $\mathrm{PPh}_{3}$ to produce complexes 7 and 8 , in which the pyridines are trans to the $\mathrm{Pd}-\mathrm{N}$ bonds. As reported earlier, ${ }^{12 a, b}$ here also the $5-\mathrm{CH}$ proton is very much shielded ( $\delta 4.717$, 4.958 ) relative to the other aromatic proton, $2-\mathrm{CH}(\delta 6.62$ for both 7 and 8 ). The remarkably low chemical shift observed for 7 is perhaps worth mentioning; to our knowledge, this is unprecedented for an aromatic proton in orthopalladated compounds.

Unlike 3 Me - or $4 \mathrm{Me}-\mathrm{py}$, $2 \mathrm{Me}-\mathrm{py}$ failed to produce any isolable product with complex 1 showing again profound steric involvements between the two adjacent 2 Me -py molecules. To see whether any sort of steric interaction is also involved in the 3Me-py derivative, variable-temperature ${ }^{1} \mathrm{H}$ NMR spectral measurements of 7 over the range -50 to $+50^{\circ} \mathrm{C}$ (at $25^{\circ} \mathrm{C}$ intervals) were undertaken. In 7 the relative orientation of the methyl groups in two 3 Me -py moieties could be syn-syn, syn-anti and anti-anti, the latter conformation being of lowest energy. Since over the entire temperature range no stereochemical change was observed the anti-anti conformation may be assumed. In fact, temperature had practically no effect on the chemical shifts due to the $\mathrm{CH}_{2} \mathrm{NEt}_{2}$ and 3 Me -py moieties. The only observable effects were on the aromatic protons; while the chemical shift due to $5-\mathrm{CH}$ monotonically decreased from $\delta 4.75$ at $50^{\circ} \mathrm{C}$ to 4.64 at $-50^{\circ} \mathrm{C}$, the shift for $2-\mathrm{CH}$ increased from $\delta 6.58$ to 6.66 .

Reaction of complex 1 with acetylacetone (Hacac) gave the bis(chelate) $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})(\mathrm{acac})_{2}\right] 9$, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of which were consistent with the expected $C_{2 v}$ symmetry. The compounds $\mathrm{PhCOCH}_{2} \mathrm{CSPh}^{2}$ and $\mathrm{MeCOCH}_{2}-$ $\mathrm{CO}_{2} \mathrm{Et}$ also smoothly reacted with 1 and in both the cases a single isomer, 10 and 11, was obtained. While in the case of 10 the sulfur atom is trans to the $\mathrm{Pd}-\mathrm{N}$ bond, in 11 the oxygen atom of the ester moiety is trans to the $\mathrm{Pd}-\mathrm{C}$ bond. The binding mode of these two ligands is in accord with their enolizing behaviour. By contrast, trifluoro(thenoyl)acetone ( Htta ) gave a mixture of the isomers 12 and 13 , which could not be separated either by fractional crystallization or by column chromatography. The notable feature in the ${ }^{1} \mathrm{H}$ NMR spectra of this mixture was the occurrence of two overlapping singlets due to the benzylic $\mathrm{CH}_{2}$ protons at $\delta 3.96$ and 3.98 and at 6.20 and 6.26 due to the CH proton of $\mathrm{tta}^{-}$. The relative heights of these signals (5.3:4.7) indicated that the two isomers were formed almost in equal amount.

Protolytic Reaction of Complex 5.-There is considerable interest in the mechanism of electrophilic cleavage of transition metal-carbon bonds. ${ }^{17}$ Homolytic cleavage of the $\mathrm{Pd}-\mathrm{C}$ bond in cyclometallated compounds has been carried out in several ways, viz. reduction, ${ }^{18,19}$ reductive carbonylation under basic conditions, ${ }^{20}$ cyanide-induced dissociation ${ }^{21}$ and protonolysis with $\mathrm{HCl}^{22}$ More recently, Ryabov and co-workers ${ }^{23}$ have reported chloride-ion-induced protolytic reaction with acetic acid. We studied this last reaction with $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2}\right.$ $\left.\mathrm{Cl}_{2}\right] 5$.

A solution of complex 5 in $\mathrm{CHCl}_{3}-\mathrm{MeCO}_{2} \mathrm{H}$ (1:1) on stirring with 2 equivalents of LiCl at room temperature gave a white product of composition $\left[\mathrm{Pd}_{2} \mathrm{~L}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{4}\right]$ 14. The IR spectrum showed two $v(\mathrm{Pd}-\mathrm{Cl})$ vibrations at 320 and $280 \mathrm{~cm}^{-1}$, indicating the presence of a cis-dichloro linkage. ${ }^{24}$ Moreover, a group of bands at 2750,2680 and $2630 \mathrm{~cm}^{-1}$ indicated the formation of a trialkylammonium ion. ${ }^{25}$ These observations led us to suggest the structure of the protonated complex shown in 14. In polar solvents 14 reverted back to 5 on treatment with a base, showing the reversible nature of reaction (1). It appears

$$
\begin{align*}
{\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]+2 \mathrm{Cl}^{-} } & +2 \mathrm{H}^{+} \rightleftharpoons \\
& {\left[\mathrm{Pd}_{2} \mathrm{~L}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{4}\right] } \tag{1}
\end{align*}
$$

that the nucleophilic attack of $\mathrm{Cl}^{-}$ion is immediately followed

10

12

13

14
by transfer of protons to the nitrogen donors. The driving force for the reaction seems to be the strong labilizing influence of the phosphine ligand and complex 14 is additionally stabilized in the solid state by the intramolecular $\mathrm{N}^{+}-\mathrm{H} \ldots \mathrm{Cl}^{-}$hydrogen bonds.

Heating of complex 14 alone in $\mathrm{CHCl}_{3}-\mathrm{MeCO}_{2} \mathrm{H}$ solvent at 80 C or carrying out reaction (1) at this temperature gave an orange-brown compound 15 and the metal-free ligand, L. Complex 15 was characterized as the well known chloridebridged trans- $\left[\mathrm{Pd}_{2}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{4}\right] .{ }^{26}$ The protolytic cleavage of the $\mathrm{Pd}-\mathrm{C}$ bonds is shown in Scheme 2

Cyclopalladation Exchange Reactions.-The splitting of the $\mathrm{Pd}-\mathrm{C}$ bond in $\mathrm{MeCO}_{2} \mathrm{H}-\mathrm{CHCl}_{3}$ suggests the possibility of a ligand-exchange reaction between a cyclopalladated complex
and a free ligand to afford a new metallocycle, as first realized by Ryabov and co-workers. ${ }^{27}$ A number of such reactions has been studied ${ }^{27-29}$ with different leaving and entering ligands, and thermodynamic and kinetic aspects have been examined. ${ }^{29}$ However, whether a doubly cyclopalladated complex would undergo exchange reaction with a monocyclopalladating ligand was not previously studied.

The exchange reaction (2) of complex 1 with azobenzene, 2phenylpyridine, 2-benzylpyridine, benzo[ $h$ ]quinoline, 8 -methyl-

$$
\left.\left.\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right]+2 \mathrm{~L}^{*} \rightleftharpoons \sim \mathrm{C} \rightleftharpoons \mathrm{Pd}\left(\mathrm{~L}^{*}-\mathrm{H}\right) \mathrm{Cl}\right\}_{2}\right]+\mathrm{L}
$$

quinoline and $\mathrm{N}, \mathrm{N}$-diethyl-4-nitrobenzylamine as the entering ligands ( $\mathrm{L}^{*}$ ) was carried out in $\mathrm{CHCl}_{3}-\mathrm{MeCO}_{2} \mathrm{H}(1: 1)$ at $60^{\circ} \mathrm{C}$ over an extended time period. In all the cases the products isolated $(30-55 \%)$ were of the composition $\left[\left\{\mathrm{Pd}\left(\mathrm{L}^{*}-\mathrm{H}\right) \mathrm{Cl}\right\}_{2}\right]$ and were characterized as the authentic cyclometallated compounds by converting them into their known soluble derivatives. ${ }^{1,2}$ The exchange reaction with 2-benzylpyridine resulted in the conversion of a five- into a six-membered metallocycle. It is also of interest that although $N, N$-di-ethyl-4-nitrobenzylamine cannot be directly cyclometallated, under exchange-reaction conditions orthopalladation occurs. ${ }^{27}$ Except for 8-methylquinoline, the exchange reactions entailed cleavage and generation of $\mathrm{sp}^{2} \mathrm{C}-\mathrm{H}$ bonds. In the case of 8 -methylquinoline, $\mathrm{Pd}-\mathrm{C}$ bond formation occurs to give $\mathrm{sp}^{3}$ $\mathrm{C}-\mathrm{H}$ bonds. The transfer of palladium from one ligand to the other has been suggested ${ }^{29}$ to take place according to the different extents of resistance shown by the two ligands towards protonolysis, i.e. a cyclopalladate more susceptible to acidolysis is more prone to exchange reaction.

Molecular Structure of Complex 5.-The crystal structure of complex 5 consists of discrete $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$ molecules separated by van der Waals distances. An ORTEP ${ }^{30}$ view of the complex along with the atom labelling scheme is shown in Fig. 1. Positional parameters and selected bond lengths and angles are given in Tables 1 and 2, respectively. Since a crystallographic two-fold axis of symmetry passes through $C(1)$ and $C(2)$ of the cyclometallated benzene ring the asymmetric unit consists of half the molecule. The metal atom in the asymmetric unit is in an appreciably distorted squareplanar environment provided by the $\mathrm{C}(3), \mathrm{N}, \mathrm{Cl}$ and P donors. These atoms are alternately displaced from the mean plane: $\mathrm{C}(3)-0.278(4), \mathrm{N} 0.263(4), \mathrm{Cl}-0.080(3)$ and $\mathrm{P} 0.086(3) \mathrm{A}$. The metal centre itself lies $0.064(2) \AA$ below the plane. The angles between adjacent atoms lie in the range 80.8(2)-95.3(2) ${ }^{\circ}$, of which $\mathrm{N}-\mathrm{Pd}-\mathrm{C}(3)$ angle is the most acute. The bond angles about Pd are dictated by the large $\mathrm{PPh}_{3}$ ligand, which to avoid contact with the cyclometallated benzene ring and the other $\mathrm{PPh}_{3}$ ligand compresses the five-membered chelate ring. Steric involvements are also prevented by twisting of the trans angles, $\mathrm{Cl}-\mathrm{Pd}-\mathrm{C}(3) 170.8(1)^{\circ}$ and $\mathrm{P}-\mathrm{Pd}-\mathrm{N} 166.4(2)^{\circ}$ from the expected linearity. The $\mathrm{Pd}-\mathrm{Cl}$ distance $2.396(3) \AA$, which is on the high side of the range $2.24-2.45 \AA$ reported for various palladium(II) complexes, ${ }^{31}$ indicates the large trans influence of the $\sigma$ bonded carbon. The relatively long $\mathrm{Pd}-\mathrm{N}$ bond distance $2.159(4) \AA$, which may be compared with other $\mathrm{Pd}-\mathrm{N}\left(\mathrm{sp}^{3}\right)$ bonds $(2.06-2.22 \AA),{ }^{2,32}$ also reflects the fairly large trans influence of $\mathrm{PPh}_{3}$. The $\mathrm{Pd}-\mathrm{P}[2.251(3) \AA]$ and $\mathrm{Pd}-\mathrm{C}(3)$ distances $[1.997(5) \AA]$ are, however, typical of complexes belonging to this category. ${ }^{2,12 a, 31 c, 32 a, 33}$ The molecular structure of 5 reveals that introduction of further steric constraints would abruptly decrease the thermodynamic stability of the complex. In retrospect, the failure of $o$-tolylphosphine to afford a definite reaction product with 1 appears consistent.

## Experimental

Materials.-The compound $\mathrm{PdCl}_{2} \cdot x \mathrm{H}_{2} \mathrm{O}$ was obtained from

Scheme 2 solv = solvent

Fig. 1 An ORTEP view of $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right] 5$
Aurora-Matthey, Calcutta. Other chemicals were available commercially and used as received. The ligand $\mathrm{PhCOCH}_{2} \mathrm{CSPh}$ was prepared according to the method given in ref. 34 and $N, N$ -diethyl-4-nitrobenzylamine was prepared by refluxing $N, N$ -diethyl-4-nitrobenzyl bromide ${ }^{35}$ with diethylamine.

Physical Measurements.-Proton and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on either a Bruker WH 270 or JEOL-FX 100 spectrometer; the former had a facility for variable-temperature measurements. The spectra were obtained as $\mathrm{CDCl}_{3}$ solutions using $\mathrm{SiMe}_{4}(\delta 0)$ as the internal reference. Assignments of ${ }^{13} \mathrm{C}$ NMR spectra were made from a combination of ${ }^{13} \mathrm{C}-\left\{{ }^{1} \mathrm{H}\right\}$ and proton-noise decoupled spectra. The ${ }^{31} \mathrm{P}$ NMR spectra were recorded with a JEOL-FX100 spectrometer, using $\mathrm{CDCl}_{3}$ solutions and $\mathrm{H}_{3} \mathrm{PO}_{4}$ as the external reference. Infrared spectra were recorded with a Perkin Elmer 783 spectrophotometer. Relative molecular mass determinations were made with $\mathrm{CHCl}_{3}$ solutions by a Knauer vapour-phase osmometer using benzil as the calibrant. Carbon, H and N analyses were performed on a Perkin Elmer model 240 C ememental analyser. Palladium was determined gravimetrically with dimethylglyoxime.

Syntheses.-Ligand L. To 2,6-bis(bromomethyl)benzene (10 g) was slowly added with stirring diethylamine ( 30 g ) and the mixture was heated under reflux for 2 h . After cooling, the solution was poured into water ( $300 \mathrm{~cm}^{3}$ ) and enough NaOH added to neutralize the HBr liberated. The ligand was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and after removal of the solvent it was distilled under reduced pressure [b.p. $82-84^{\circ} \mathrm{C}$ at 0.1 mmHg$\left.)(c a .13 .3 \mathrm{~Pa})\right] \delta_{\mathrm{H}}$ $1.07\left(12 \mathrm{H}, \mathrm{t}, 9,9^{\prime}-\mathrm{CH}_{3}\right), 2.54\left(8 \mathrm{H}, \mathrm{m}, 8,8^{\prime}-\mathrm{CH}_{2}\right), 3.54(4 \mathrm{H}, \mathrm{s}, 7-$ $\left.\mathrm{CH}_{2}\right)$ and $7.20(4 \mathrm{H}, \mathrm{m}$, aromatic $)$.

$\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{Cl}_{2}\right]$ 1. To a methanol solution $\left(100 \mathrm{~cm}^{3}\right)$ of the ligand ( $1.24 \mathrm{~g}, 5 \mathrm{mmol}$ ) and triethylamine ( $1 \mathrm{~g}, 10 \mathrm{mmol}$ ) was added in small portions with stirring a methanol solution ( $50 \mathrm{~cm}^{3}$ ) of $\mathrm{Li}_{2}\left[\mathrm{PdCl}_{4}\right](2.62 \mathrm{~g}, 10 \mathrm{mmol})$. The light yellow product that deposited was filtered off after 1 h and washed thoroughly with water, MeOH and $\mathrm{Me}_{2} \mathrm{CO}$; yield $2.5 \mathrm{~g}, 95 \%$ (Found: C, 36.6; H, 5.05; N, 5.3; Pd, 40.25. $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{Pd}_{2}$ requires C, $36.25 ; \mathrm{H}, 4.9 ; \mathrm{N}, 5.3 ; \mathrm{Pd}, 40.15 \%$ ).
$\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H}) \mathrm{X}_{2}\right]\left(\mathrm{X}=\mathrm{Br} 2, \mathrm{~N}_{3} 3\right.$ or NCS 4$)$. To a stirred suspension of complex $1(0.53 \mathrm{~g}, 1 \mathrm{mmol})$ in $\mathrm{MeCN}\left(50 \mathrm{~cm}^{3}\right)$ was added $\mathrm{Ag}\left[\mathrm{ClO}_{4}\right](0.36 \mathrm{~g}, 2 \mathrm{mmol})$. The AgCl precipitated was filtered off and the filtrate treated with an aqueous solution of $\mathrm{NaX}(3 \mathrm{mmol})$. The product that separated from the solution was filtered off and washed successively with water, MeOH and $\mathrm{Me}_{2} \mathrm{CO}$ (Found: C, 34.8; H, 4.9; N, 20.4; Pd, 39.4. $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{~N}_{8} \mathrm{Pd}_{2} 3$ requires C, $35.35 ; \mathrm{H}, 4.8 ; \mathrm{N}, 20.65 ; \mathrm{Pd}, 39.2 \%$ ).
$\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$ 5. A stirred suspension of complex $1(1.06 \mathrm{~g}, 2 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(50 \mathrm{~cm}^{3}\right)$ was treated with $\mathrm{PPh}_{3}(1.05 \mathrm{~g}, 4 \mathrm{mmol})$. When all the material dissolved the solution was filtered. The filtrate on rotary evaporation gave yellow crystals of the complex, which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$; yield $2 \mathrm{~g}, 95 \%$ (Found: C, 59.3; H, 5.4; N, 2.7; Pd 20.3. $\mathrm{C}_{52} \mathrm{H}_{56} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{P}_{2} \mathrm{Pd}_{2}$ requires $\mathrm{C}, 59.2 ; \mathrm{H}, 5.3 ; \mathrm{N}, 2.65$; $\mathrm{Pd}, 20.2 \%$ ). $\delta_{\mathrm{H}} 1.30\left(12 \mathrm{H}, \mathrm{m}, 9,9^{\prime}-\mathrm{CH}_{3}\right), 2.75\left(4 \mathrm{H}, \mathrm{m}, 8-\mathrm{CH}_{2}\right)$, $2.95\left(4 \mathrm{H}, \mathrm{m}, 8^{\prime}-\mathrm{CH}_{2}\right), 4.01\left(4 \mathrm{H}, \mathrm{s}, 7-\mathrm{CH}_{2}\right), 5.52(1 \mathrm{H}, \mathrm{t}, 5-\mathrm{CH})$, $6.70(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH})$ and $7.2-7.5\left(30 \mathrm{H}, \mathrm{m}, \mathrm{PPh}_{3}\right) ; \delta_{\mathrm{C}} 12.5\left(9,9^{\prime}-\mathrm{C}\right)$, 52.1 ( $8,8^{\prime}-\mathrm{C}$ ), 66.2 ( $7-\mathrm{C}$ ), 116.9 (2-C), 130.5 ( $5-\mathrm{C}$ ), 143.1 ( $1,3-\mathrm{C}$ ), 152.9 (4,6-C), 127.9, 128.3, 131.1, 133.0, 135.1, $135.6\left(\mathrm{PPh}_{3}\right) ; \delta_{\mathrm{P}}$ 35.2.
$\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2}\left(\mathrm{~N}_{3}\right)_{2}\right]$ 6. This compound was prepared from complex $\mathbf{3}$ in the same way as 5 . It was also obtained by stirring a mixture of $5(0.53,0.5 \mathrm{mmol})$ and $\mathrm{Ag}\left[\mathrm{ClO}_{4}\right]$ $(0.2 \mathrm{~g}, 1 \mathrm{mmol})$ in $\mathrm{MeCN}\left(20 \mathrm{~cm}^{3}\right)$ followed by the addition of an aqueous solution ( $5 \mathrm{~cm}^{3}$ ) of $\mathrm{NaN}_{3}(0.1 \mathrm{~g}, 1.5 \mathrm{mmol})$ to the filtrate. The compound was recrystallized from $\mathrm{CHCl}_{3}-\mathrm{MeOH}$ (Found: C, 58.2; H, 5.15; N, 10.4; Pd, 19.8. $\mathrm{C}_{52} \mathrm{H}_{56} \mathrm{~N}_{8} \mathrm{P}_{2} \mathrm{Pd}_{2}$ requires C, $58.5 ; \mathrm{H}, 5.25 ; \mathrm{N}, 10.5 ; 19.95 \%$ ). $\delta_{\mathrm{H}} 1.32(12 \mathrm{H}, \mathrm{m}$, $\left.9,9^{\prime}-\mathrm{CH}_{3}\right), 2.84\left(8 \mathrm{H}, \mathrm{m}, 8,8^{\prime}-\mathrm{CH}_{2}\right), 4.02\left(4 \mathrm{H}, \mathrm{s}, 7-\mathrm{CH}_{2}\right)$, $5.60(1 \mathrm{H}, \mathrm{t}, 5-\mathrm{CH}), 6.68(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH})$ and $7.1-7.7(30 \mathrm{H}, \mathrm{m}$, $\mathrm{PPh}_{3}$ ).
$\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})(\text { base })_{2} \mathrm{Cl}_{2}\right]$ (base $=3 \mathrm{Me}-$ py 7 or 4 Me -py 8). To a stirred suspension of complex $1(0.53 \mathrm{~g}, 1 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}$ ( $20 \mathrm{~cm}^{3}$ ) was added the pyridine base ( $0.19 \mathrm{~g}, 2 \mathrm{mmol}$ ). The clear light yellow solution that resulted was filtered after 0.5 h . On removing the solvent on a rotary evaporator a thick syrup was obtained, which on stirring with $\mathrm{Et}_{2} \mathrm{O}$ became a solid mass. The compound was recrystallized from $\mathrm{CHCl}_{3}-\mathrm{MeOH}$; yield $0.68 \mathrm{~g}, 95 \%$ (Found for 7: C, 46.75; H, 5.55; N, 7.6; Pd, 29.9. $\mathrm{C}_{28} \mathrm{H}_{40} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{Pd}_{2}$ requires C, $46.95 ; \mathrm{H}, 5.6 ; \mathrm{N}, 7.8 ; \mathrm{Pd}, 29.75 \%$ ). $\delta_{\mathrm{H}}$ for $71.57\left(12 \mathrm{H}, \mathrm{t}, 9,9^{\prime}-\mathrm{CH}_{3}\right), 2.22$ ( $6, \mathrm{~s}, 3-\mathrm{Me}$ of py), $2.77\left(4 \mathrm{H}, \mathrm{m}, 8-\mathrm{CH}_{2}\right), 3.27\left(4 \mathrm{H}, \mathrm{m}, 8^{\prime}-\mathrm{CH}_{2}\right), 3.88\left(4 \mathrm{H}, \mathrm{s}, 7-\mathrm{CH}_{2}\right)$, $4.71(1 \mathrm{H}, \mathrm{s}, 5-\mathrm{CH}), 6.62(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH}), 6.94(2 \mathrm{H}, \mathrm{m}, 5-\mathrm{CH}$ of py), $7.33(2 \mathrm{H}, \mathrm{d}, 4-\mathrm{CH}$ of py), $8.40(2 \mathrm{H}, \mathrm{d}, 6-\mathrm{CH}$ of py) and $8.47\left(2 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH}\right.$ of py). $\delta_{\mathrm{H}}$ for $81.58\left(4 \mathrm{H}, \mathrm{t}, 9,9^{\prime}-\mathrm{CH}_{3}\right)$, 2.37 ( $6 \mathrm{H}, \mathrm{s}, 4-\mathrm{Me}$ of py), $2.79\left(4 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}_{2}\right), 3.27(4 \mathrm{H}, \mathrm{m}$, $\left.8^{\prime}-\mathrm{CH}_{2}\right), 3.90\left(4 \mathrm{H}, \mathrm{s}, 7-\mathrm{CH}_{2}\right), 4.95(1 \mathrm{H}, \mathrm{s}, 5-\mathrm{CH}), 6.62(1 \mathrm{H}, \mathrm{s}$, $2-\mathrm{CH}), 6.88(4 \mathrm{H}, \mathrm{d}, 3,5-\mathrm{CH}$ of py) and $8.46(4 \mathrm{H}, \mathrm{d}, 2,6-\mathrm{CH}$ of py); $\delta_{C} 13.5$ ( $9,9^{\prime}-\mathrm{C}$ ), 21.6 ( $4-\mathrm{Me}$ of py), $56.3\left(8,8^{\prime}-\mathrm{C}\right)$, 66.3 (7-C), 114.6 (2-C), 125.6 ( $2,6-\mathrm{C}$ of py), 126.2 ( $3,5-\mathrm{C}$ of py), 135.7 (5-C), 145.6 (1,3-C), 149.1 (4-C of py) and 153.8 (4,6-C).
$\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})(\text { dik })_{2}\right] \quad\left(\mathrm{Hdik}=\mathrm{MeCOCH}_{2} \mathrm{COMe}^{2} 9, \mathrm{Ph}-\right.$ $\mathrm{COCH}_{2} \mathrm{CSPh} 10$, MeCOCH $\mathrm{CO}_{2} \mathrm{Et} 11$ or $\mathrm{C}_{4} \mathrm{H}_{3} \mathrm{SCOCH}_{2}-$ $\mathrm{COCF}_{3}, \mathbf{1 2}, \mathbf{1 3}$ ). To a stired suspension of complex $1(2 \mathrm{mmol}$, 1.06 g ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(50 \mathrm{~cm}^{3}\right)$ were added a methanol solution ( $20 \mathrm{~cm}^{3}$ ) of the appropriate chelating reagent ( 4 mmol ) and an aqueous solution $5 \mathrm{~cm}^{3}$ ) of $\mathrm{NaOH}(0.16 \mathrm{~g}, 4 \mathrm{mmol})$. Over a period of 2 h a clear solution was obtained and was filtered. The filtrate on concentration afforded the product, which was washed with water and MeOH and recrystallized from $\mathrm{CHCl}_{3}-\mathrm{MeOH}$; yield ca. $90 \%$.

Complex 9 (Found: C, 47.75; H, 6.05; N, 4.1; Pd, 32.6. $\mathrm{C}_{26} \mathrm{H}_{40} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{Pd}_{2}$ requires C, 47.5 ; $\mathrm{H}, 6.1$; $\mathrm{N}, 4.25$; Pd, $32.4 \%$ ): $\delta_{\mathrm{H}} 1.48\left(12 \mathrm{H}, \mathrm{t}, 9,9^{\prime}-\mathrm{CH}_{3}\right), 1.90\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right.$ of acac) $1.98(6 \mathrm{H}, \mathrm{s}$, $\mathrm{CH}_{3}$ of acac), $2.82\left(4 \mathrm{H}, \mathrm{m}, 8-\mathrm{CH}_{2}\right), 3.10\left(4 \mathrm{H}, \mathrm{m}, 8^{\prime}-\mathrm{CH}_{2}\right)$, $3.88\left(4 \mathrm{H}, \mathrm{s}, 7-\mathrm{CH}_{2}\right), 5.28(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}$ of acac), $6.55(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH})$ and $7.22(1 \mathrm{H}, \mathrm{s}, 5-\mathrm{CH}) ; \delta_{\mathrm{C}} 12.4\left(9,9^{\prime}-\mathrm{C}\right), 27.3\left(\mathrm{CH}_{3}\right.$ of acac), $28.2\left(\mathrm{CH}_{3}\right.$ of acac), $54.5\left(8,8^{\prime}-\mathrm{C}\right), 66.6(7-\mathrm{C}), 99.2(\mathrm{CH}$ of acac), 113.4 (2-C), 131.8 (5-C), 142.3 (1,3-C), 142.9 (4,6-C), 186.5 (CO of acac) and 187.4 (CO of acac).

Complex 10 (Found: C, 58.6, H, 5.2; N, 3.1. $\mathrm{C}_{46} \mathrm{H}_{48} \mathrm{~N}_{2}$ $\mathrm{O}_{2} \mathrm{Pd}_{2} \mathrm{~S}_{2}$ requires C, $\left.58.9 ; \mathrm{H}, 5.1 ; \mathrm{N}, 3.0 \%\right): \delta_{\mathrm{H}} 1.60(12 \mathrm{H}, \mathrm{t}$, $\left.9,9^{\prime}-\mathrm{CH}_{3}\right), 3.04\left(8 \mathrm{H}, \mathrm{m}, 8,8^{\prime}-\mathrm{CH}_{2}\right), 4.01\left(4 \mathrm{H}, \mathrm{s}, 7-\mathrm{CH}_{2}\right)$, $6.64(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}$ of ligand) and $6.8-8.1(22 \mathrm{H}, \mathrm{m}$, aromatic).
Complex 11 (Found: C, 47.1; H, 6.2; N, 3.8. $\mathrm{C}_{28} \mathrm{H}_{44} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{Pd}_{2}$ requires $\mathrm{C}, 46.85 ; \mathrm{H}, 6.1 ; \mathrm{N}, 3.9 \%$ ): $\delta_{\mathrm{H}} 1.23\left(6 \mathrm{H}, \mathrm{t}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ of ligand), $1.53\left(12 \mathrm{H}, \mathrm{t}, 9,9 \mathrm{CH}_{3}\right), 2.76\left(4 \mathrm{H}, \mathrm{m}, 8-\mathrm{CH}_{2}\right)$, $2.88\left(4 \mathrm{H}, \mathrm{m}, 8^{\prime}-\mathrm{CH}_{2}\right), 3.55\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right.$ of ligand), $3.82(4 \mathrm{H}, \mathrm{s}$,

7- $\mathrm{CH}_{2}$ ), $3.99\left(4 \mathrm{H}, \mathrm{q}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ of ligand), $4.70(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}$ of ligand), $6.47(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH})$ and $7.15(1 \mathrm{H}, \mathrm{s}, 5-\mathrm{CH})$.

Complexes 12 and 13 (Found: $\mathrm{C}, 42.9 ; \mathrm{H}, 4.0$; N, 2.95; Pd, 23.4. $\mathrm{C}_{32} \mathrm{H}_{34} \mathrm{~F}_{6} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{Pd}_{2} \mathrm{~S}_{2}$ requires $\mathrm{C}, 42.65 ; \mathrm{H}, 3.8 ; \mathrm{N}, 3.1$; $\mathrm{Pd}, 23.6 \%$ ): $\delta_{\mathrm{H}} 1.52\left(12 \mathrm{H}, \mathrm{m}, 9,9^{\prime}-\mathrm{CH}_{3}\right)$, $2.88\left(8 \mathrm{H}, \mathrm{m}, 8,8^{\prime}-\mathrm{CH}_{2}\right)$, 3.96, $3.98\left(4 \mathrm{H}, \mathrm{s}, 5-\mathrm{CH}_{2}\right), 6.20,6.26(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}$ of tta), $6.62(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{CH}), 7.18\left(1 \mathrm{H}, \mathrm{s}, 5-\mathrm{CH}_{2}\right)$ and $7.0-7.8(3 \mathrm{H}, \mathrm{m}$, $\mathrm{C}_{4} \mathrm{H}_{3} \mathrm{~S}$ of tta).

Protolytic Reaction of Complex 5.-To a chloroform solution ( $25 \mathrm{~cm}^{3}$ ) of complex $5(0.53 \mathrm{~g}, 0.5 \mathrm{mmol})$ a solution of LiCl ( $0.064 \mathrm{~g}, 1.5 \mathrm{mmol}$ ) in acetic acid ( $25 \mathrm{~cm}^{3}$ ) was added. The solution was stirred at room temperature and after a short while a white crystalline product separated. The product 14 was filtered off, washed with $\mathrm{CHCl}_{3}$ and dried in vacuum; yield $0.36 \mathrm{~g}, 65 \%$ (Found: C, 54.9; H, 5.3; N, 2.35; Pd, 19.2. $\mathrm{C}_{52} \mathrm{H}_{58} \mathrm{Cl}_{4} \mathrm{~N}_{2} \mathrm{P}_{2} \mathrm{Pd}_{2}$ requires C, $55.4 ; \mathrm{H}, 5.15 ; \mathrm{N}, 2.5 ; \mathrm{Pd}, 18.9 \%$ ).
When the above reaction mixture was heated at $80^{\circ} \mathrm{C}$ for 0.5 h , brown-orange crystals of complex 15 deposited. They were filtered off and washed successively with $\mathrm{MeCO}_{2} \mathrm{H}, \mathrm{CHCl}_{3}$ and $\mathrm{Et}_{2} \mathrm{O}$; yield $0.36 \mathrm{~g}, 80 \%$ (Found: C, 49.5; H, 3.2; Pd, 24.35 . $\mathrm{C}_{36} \mathrm{H}_{30} \mathrm{Cl}_{4} \mathrm{P}_{2} \mathrm{Pd}_{2}$ requires $\mathrm{C}, 49.15 ; \mathrm{H}, 3.4 ; \mathrm{Pd}, 24.2 \%$ ). Complex 15 was also obtained by heating a suspension of 14 in $\mathrm{CHCl}_{3}-$ $\mathrm{MeCO}_{2} \mathrm{H}$ at $80^{\circ} \mathrm{C}$.

Cyclopalladation Exchange Reactions.-The following general method was used for the exchange reactions involving $\left[\mathrm{Pd}_{2}-\right.$ $(\mathrm{L}-2 \mathrm{H}) \mathrm{Cl}_{2}$ ] 1 and the entering ligands ( $\mathrm{L}^{*}$ ) azobenzene, 2-phenylpyridine, benzo $[h]$ quinoline, 8 -methylquinoline, 2benzylpyridine and $N, N$-diethyl-4-nitrobenzylamine. To a suspension of $1(1.06 \mathrm{~g}, 2 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}-\mathrm{MeCO}_{2} \mathrm{H}\left(1: 1,60 \mathrm{~cm}^{3}\right)$ was added the entering ligand ( 4 mmol ). The mixture was heated at $60 \pm 2{ }^{\circ} \mathrm{C}$ for $12-16 \mathrm{~h}$. In the case of azobenzene the solution was filtered hot and from the filtrate red crystals of $\left[\left\{\operatorname{Pd}\left(\mathrm{L}^{*}-\mathrm{H}\right) \mathrm{Cl}_{2}\right\}_{2}\right]$ deposited on standing. In all other cases the product $\left[\left\{\operatorname{Pd}\left(\mathrm{L}^{*}-\mathrm{H}\right) \mathrm{Cl}\right\}_{2}\right]$ being insoluble in the solvent was filtered off and washed with MeOH and $\mathrm{Et}_{2} \mathrm{O}$. The yield varied between 30 and $55 \%$, lowest for $N, N$-diethyl-4-nitrobenzylamine and highest for azobenzene.

Crystal Structure Determination of $\left[\mathrm{Pd}_{2}(\mathrm{~L}-2 \mathrm{H})\left(\mathrm{PPh}_{3}\right)_{2^{-}}\right.$ $\mathrm{Cl}_{2}$ ] 5.-Diffraction-quality crystals were obtained by diffusion of MeOH into a $\mathrm{CHCl}_{3}$ solution of the complex. A suitable crystal was mounted on a glass fibre.
Crystal data. $\mathrm{C}_{52} \mathrm{H}_{56} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{P}_{2} \mathrm{Pd}_{2}, \quad M=1054.7$, monoclinic, space group $C 2 / c, a=20.676(4), b=12.436(3), c=$ 19.445(4) $\AA, \beta=104.29(3)^{\circ}, U=4845(2) \AA^{3}$ (by least-squares refinement of diffractometer angles for 20 automatically centred reflections having $2010-25^{\circ}, \lambda=0.71073 \AA$ ), $Z=4, D_{\mathrm{c}}=$ $1.445 \mathrm{~g} \mathrm{~cm}^{-3} \quad F(000)=1112$. Crystal dimensions: $0.25 \times$ $0.30 \times 0.45 \mathrm{~mm}, \mu(\mathrm{Mo}-\mathrm{K} \alpha) 8.60 \mathrm{~cm}^{-1}$.

Data collection and processing. Intensity data were collected with a Nicolet R3m/V automated diffractometer using graphitemonochromated Mo-K $\alpha$ radiation. Intensities of three standard reflections monitored after every 97 did not show any appreciable decay during data collection. The intensity data were corrected for Lorentz-polarization effects and for absorption by the empirical method of North et al. ${ }^{36} \mathrm{~A}$ total of 4409 reflections were collected in the range $2<2 \theta<50^{\circ}$, of which 3533 independent reflections with $I>2 \sigma(I)$ were used for structure determination.

Structure analysis and refinement. Systematic absences led to the identification of the space group as $C_{c}$ or $C 2 / c$. The structure was solved in the latter. The position of the Pd atom was determined from a Patterson map and the remaining nonhydrogen atoms were located from successive Fourier maps. The structure was refined by the full-matrix least-squares method using the program SHELX. ${ }^{37}$ In the final stages of refinement all non-hydrogen atoms were made anisotropic while the hydrogen atoms were held fixed in the geometrically calculated positions with isotropic thermal parameters. The
weighting scheme $w=1 /\left[\sigma^{2}\left(F_{0}\right)+0.002 F_{0}{ }^{2}\right]$, with $\sigma\left(F_{0}\right)$ from counting statistics, gave satisfactory agreement analyses. The highest peak in the final Fourier difference map was $0.42 \mathrm{e}^{-3}$. Final $R$ and $R^{\prime}$ values were 0.035 and 0.043 . Anomalous dispersion corrections were applied to Pd and scattering factor data from ref. 38. All computations were carried out on Cyber 180/840A and Vax systems.
Additional material available from the Cambridge Crystallographic Data Centre comprises H -atom coordinates, thermal parameters and remaining bond lengths and angles.

## Acknowledgements

We are thankful to Mr. S. K. Chandra for X-ray data collection and ORTEP drawing carried out at the National Single Crystal Diffractometer Facility established by the Department of Science and Technology, New Delhi in the Department of Inorganic Chemistry, Indian Association for the Cultivation of Science, Calcutta. Also to Professor A. Chakravorty of this Department for suggesting the correct space group. We thank the Sophisticated Instrumentation Facility, Indian Institute of Science, Bangalore for NMR spectra.
