Received 16th November 1998, Accepted 27th January 1999

1-Aryl-2-methylenecyclopropanes reacted with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $50^{\circ} \mathrm{C}$ to give $\left[\mathrm{RhCl}\left(\eta^{4}-\mathrm{CH}_{2}=\mathrm{CArCH}=\mathrm{CH}_{2}\right)\left(\mathrm{PPh}_{3}\right)_{2}\right]$ $\left(\mathrm{Ar}=\mathrm{C}_{6} \mathrm{H}_{5} \mathbf{1 a}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{~F}-p \mathbf{1 b}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Me}-p \mathbf{1 c}\right.$ or $\left.\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OMe}-p \mathbf{1 d}\right)$ via ring opening isomerization of the substrate and its subsequent co-ordination to Rh. The diene-co-ordinated rhodium complexes have been characterized by X-ray crystallography and NMR spectroscopy. Similar reaction at $0^{\circ} \mathrm{C}$ afforded the rhodium(I) complexes with $\pi$-coordinated 1-aryl-2-methylenecyclopropane, $\left[\mathrm{RhCl}\left(\eta^{2}-\mathrm{CH}_{2}=\mathrm{CCH}_{2} \mathrm{CHAr}\right)\left(\mathrm{PPh}_{3}\right)_{2}\right]\left(\mathrm{Ar}=\mathrm{C}_{6} \mathrm{H}_{5} \mathbf{2 a}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{~F}-p\right.$ 2b, $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Me}-p \mathbf{2 c}$ or $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OMe}-p \mathbf{2 d}$ ). Exchange of the ligand of 2a with added 1-aryl-2-methylenecyclopropanes occurs reversibly at $30-45^{\circ} \mathrm{C}$ with the thermodynamic parameters of the reactions $\mathbf{2 a}+\mathrm{CH}_{2}=$ CCH $_{2} \mathrm{CHC}_{6} \mathrm{H}_{4} \mathrm{X}-p \rightleftarrows \mathbf{2 b}$ $\left(\right.$ or $\mathbf{2 c}$ ) $+\mathrm{CH}_{2}=\mathrm{CCH}_{2} \mathrm{CHC}_{6} \mathrm{H}_{5}$ being $\Delta H^{\circ}=-10.3 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $\Delta S^{\circ}=-32 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ for $\mathrm{X}=\mathrm{F}$ and $\Delta H^{\circ}=2.2 \mathrm{~kJ}$ $\mathrm{mol}^{-1}$ and $\Delta S^{\circ}=-2.6 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ for $\mathrm{X}=\mathrm{Me}$, respectively, at 298 K . The structure of a $\mathrm{PEt}_{3}$ co-ordinated analog, $\left[\mathrm{RhCl}\left(\eta^{2}-\mathrm{CH}_{2}=\mathrm{CCH}_{2} \mathrm{CHC}_{6} \mathrm{H}_{4} \mathrm{Me}-p\right)\left(\mathrm{PEt}_{3}\right)_{2}\right] \mathbf{3 c}$, has been determined by X-ray crystallography. The reaction of 1-methylene-2-phenylcyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $25^{\circ} \mathrm{C}$ gave a mixture of $\mathbf{1 a}$ and $\mathbf{2 a}$. Heating of a benzene solution of 2a at $50^{\circ} \mathrm{C}$ turned it into $\mathbf{1 a}$ in low yield $(<7 \%)$, while the reactions of 1-methylene-2-phenylcyclopropane with 2a at the same temperature gave $\mathbf{1 a}(10 \%)$ and 2-phenylbuta-1,3-diene ( $14 \%$ ). The amounts of the products formed via ring opening isomerization in these reactions are much smaller than those in the reaction of 1-methylene-2-phenylcyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $50^{\circ} \mathrm{C}$.

Methylenecyclopropane with a high strain energy ( $\Delta H_{\mathrm{f}}$ larger than that of cyclopropane by $\left.c a .35 \mathrm{kcal} \mathrm{mol}{ }^{-1}\right)^{1}$ has been regarded as a useful synthetic equivalent of butadiene and trimethylenemethane ${ }^{2,3}$ since upon reaction with transition metal complexes it is easily turned into the ring-opened isomers that are free from the ring strain. The reactions of methylenecyclopropane and its derivatives with organotransition metal complexes give various products such as 1,3-diene (Sc), ${ }^{4}$ trimethylenemethane-co-ordinated metal complexes ( $\mathrm{Fe}, \mathrm{Mo}$ ), ${ }^{5}$ and organometallic compounds formed via insertion of a $\mathrm{C}=\mathrm{C}$ double bond into $\mathrm{M}-\mathrm{C}$ or $\mathrm{M}-\mathrm{Cl}$ bonds ( $\mathrm{Ti}, \mathrm{Pd}$ ). ${ }^{6,7}$

Rhodium(I) complexes, which often cause $\mathrm{C}-\mathrm{C}$ bond activation of small-membered ring molecules, ${ }^{8}$ react also with methylenecyclopropanes to form 1,3-dienes ${ }^{9,10}$ or organic products through formation of a trimethylenemethane-co-ordinated rhodium complex and its further reaction with olefins. ${ }^{11}$ Complexes containing $\eta^{2}$-co-ordinated methylenecyclopropane were also prepared. ${ }^{12}$ There have been few reports on elucidation of the detailed mechanism of the reactions. Ring opening isomerization of vinylcyclopropane and cyclopropene promoted by $\mathrm{d}^{9}$ metal (Co, Ir) complexes was proposed to involve pre-co-ordination of the $\mathrm{C}=\mathrm{C}$ double bond of the substrate and ensuing $\mathrm{C}-\mathrm{C}$ bond cleavage of the three-membered ring of the molecule. ${ }^{13,14}$ Cobalt and rhodium complex promoted reactions of methylenecyclopropane and its derivatives giving 1,3-dienes have also been believed to proceed via initial $\pi$ co-ordination followed by $\mathrm{C}-\mathrm{C}$ bond activation of the resulting intermediate (A) as shown in Scheme 1. ${ }^{10,15}$ Although such an anchoring effect of the $\mathrm{C}=\mathrm{C}$ double bond of methylenecyclopropanes may facilitate the ring-opening isomerization, no experimental results have been presented to support the above reaction pathway.

In this paper we report the reaction of 1-aryl-2-methyl-

(A)

Scheme 1
enecyclopropanes with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$, leading to ring opening isomerization or $\eta^{2}$-co-ordination of a $\mathrm{C}=\mathrm{C}$ double bond of the substrate depending on the conditions. The reaction pathway of the ring opening isomerization is discussed based on several reactions of rhodium complexes with and without $\pi$-coordinated 1-methylene-2-phenylcyclopropane. Part of this work was reported in a preliminary form. ${ }^{16}$

Fig. 1 An ORTEP ${ }^{17}$ drawing of $\left[\mathrm{RhCl}_{\{ } \mathrm{CH}_{2}=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Me}-p\right) \mathrm{CH}=\mathrm{CH}_{2}\right]-$ $\left.\left(\mathrm{PPh}_{3}\right)_{2}\right] \cdot 0.5 \mathrm{C}_{6} \mathrm{H}_{14} \mathbf{1} \mathbf{c} \cdot 0.5 \mathrm{C}_{6} \mathrm{H}_{14}$ with $50 \%$ thermal ellipsoidal plotting. Atoms of the solvated hexane and hydrogen atoms were omitted for simplicity.

## Results and discussion

## Preparation and characterization of the rhodium complexes

1-Methylene-2-phenylcyclopropane reacts with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ (5:1 molar ratio) at $50^{\circ} \mathrm{C}$ to give $\left[\mathrm{RhCl}\left(\eta^{4}-\mathrm{CH}_{2}=\mathrm{CPhCH}=\right.\right.$ $\left.\mathrm{CH}_{2}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ 1a in $95 \%$ yield after 16 h . The reactions of 1-aryl-2-methylenecyclopropanes with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ give analogous complexes $\mathbf{1 b} \mathbf{- 1 d}$ as summarized in eqn. 1. Fig. 1 depicts the

molecular structure of 1c determined by X-ray crystallography. The molecule has a distorted piano-stool co-ordination around the Rh that is bonded to a $\eta^{4}-2$-( $p$-methylphenyl)buta-1,3-diene ligand and to Cl and $\mathrm{PPh}_{3}$ ligands. The diene ligand adopts an $s$-cis conformation similarly to other rhodium(I) complexes with 1,3 -diene ligands. ${ }^{18}$ Table 1 summarizes selected bond dis-
tances and angles of $\mathbf{1 c}$ and of the preliminarily reported 1a. ${ }^{16}$ The C2-C3 bond distances of the diene ligand [1.44(1) $\AA$ for 1a and $1.411(5) \AA$ for $\mathbf{1 c}]$ are shorter than that of a single bond of an unco-ordinated 1,3-diene molecule. The above results as well as elongation of the $\mathrm{C}=\mathrm{C}$ double bonds $(\mathrm{C} 1=\mathrm{C} 2$ and $\mathrm{C} 3=\mathrm{C} 4)$ are consistent with partial contribution of a metallacyclopentene structure to co-ordination of the diene ligand as proposed for many transition metal diene complexes. ${ }^{19}$

Complexes 1a-1d were characterized also by NMR ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and ${ }^{31} \mathrm{P}$ ) spectroscopy. The ${ }^{1} \mathrm{H}$ NMR spectra show two signals at $\delta 3.44-3.62$ and 5.45-5.59 due to two hydrogens of the diene ligand. Signals of the other three hydrogens of the ligand appear at significantly higher magnetic field ( $\delta-0.56$ to -0.49 , $0.56-0.58$ and $0.77-0.82$ ). The ${ }^{13} \mathrm{C}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of 1a contains signals due to the diene carbons at $\delta 38.7,48.3,87.8$ and 113.0. The two former signals of $=\mathrm{CH}_{2}$ carbons are split by PC or RhC coupling. These ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals were assigned by ${ }^{1} \mathrm{H}^{-1} \mathrm{H}$ and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ COSY technique although the assignment of a part of the $=\mathrm{CH}_{2}$ hydrogens is ambiguous. The molecular structures of $\mathbf{1 a}$ and $\mathbf{1 c}$ suggest close contact of three $=\mathrm{CH}_{2}$ hydrogens (one attached to Cl and two to C 4 in Fig. 1) to phenyl planes of the $\mathrm{PPh}_{3}$ ligands. Thus, the high magnetic field positions of the three ${ }^{1} \mathrm{H}$ NMR signals can be attributed to a magnetic anisotropy effect of $\pi$ electrons of the phenyl groups.

The reactions of 1-aryl-2-methylenecyclopropanes with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $0{ }^{\circ} \mathrm{C}$ afforded complexes with $\pi$-co-ordinated 1-aryl-2-methylenecyclopropane, $\left[\mathrm{RhCl}\left(\eta^{2}-\mathrm{CH}_{2}=\overparen{\mathrm{CH}_{2}} \mathbf{C H A r}\right)\right.$ $\left(\mathrm{PPh}_{3}\right)_{2}$ ] 2a-2d, which were separated from the solution during the reaction, eqn. (2). The complexes were characterized by

NMR spectroscopy. The ${ }^{13} \mathrm{C}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR signal of the $=\mathrm{CH}_{2}$ carbon of 2a appears at high magnetic field ( $\delta 34.2$ ) with splitting due to RhC coupling ( $J 13 \mathrm{~Hz}$ ). The signal due to the other vinylic carbon shows coupling with Rh also ( $\delta 61.5, J 22 \mathrm{~Hz}$ ), whereas the remaining two carbon signals of the cyclopropane ring are free from such coupling. These results indicate $\eta^{2}$ coordination of the double bond to Rh. Upfield shift of the ${ }^{1} \mathrm{H}$ NMR signals of two vinylic hydrogens ( $\delta 2.18-2.34$ ) from those of unco-ordinated 1-methylene-2-phenylcyclopropane ( $\delta 5.50$ ) also indicates co-ordination of the olefin group. The single ${ }^{31} \mathrm{P}$ $\left\{{ }^{1} \mathrm{H}\right\}$ NMR signal with $J(\mathrm{RhP})$ of 133 Hz suggests a structure with $\mathrm{PPh}_{3}$ ligands at mutually trans positions, similar to other $\mathrm{RhCl}($ olefin $)\left(\mathrm{PR}_{3}\right)_{2}$-type complexes. ${ }^{20}$ Complexes 2b-2d show quite similar NMR data to those of $\mathbf{2 a}$ and are considered to have the same four-co-ordinated structure. Introduction of ambient pressure of CO to a solution of 2a led to formation of quantitative amounts of 1-methylene-2-phenylcyclopropane and $\left[\mathrm{RhCl}(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}\right]$ which were identified by GLC and by IR and NMR spectroscopy, respectively, eqn. (3). Recovery of

the organic product in a high yield indicates that the complex contains 1-methylene-2-phenylcyclopropane as the ligand.

Fig. 2 An ORTEP drawing of $\left[\mathrm{RhCl}\left(\mathrm{CH}_{2}=\overparen{\mathrm{CCH}_{2} \mathrm{C}} \mathrm{CC}_{6} \mathrm{H}_{4} \mathrm{Me}-p\right)\right.$ $\left(\mathrm{PEt}_{3}\right)_{2}$ ] 3c with $50 \%$ thermal ellipsoidal plotting. Hydrogen atoms except for those in vinyl and cyclopropyl groups were omitted for simplicity. Selected bond distances ( $\AA$ ) and angles $\left({ }^{\circ}\right)$ : $\mathrm{Rh}-\mathrm{Cl} 2.373(2)$, Rh-P1 2.323(2), Rh-P2 2.319(2), Rh-C1 2.105(7), Rh-C2 2.047(7), C1-C2 1.405(9), C2-C3 1.497(9), C2-C4 1.465(10) and C3-C4 1.528(10); Cl-Rh-P1 86.45(8), Cl-Rh-P286.31(8), P1-Rh-P2 171.18(7), C1-Rh-C2 39.5(3), Rh-C1-C2 68.0(4), Rh-C2-C1 72.4(4), C1-C2-C3 136.8(7), C1-C2-C4 136.5(7), C2-C3-C4 57.9(5), C2-C4-C3 60.0(5), C3-C2-C4 62.1(5), H1-C1-H2 107, C2-C1-H1 119 and C2-C1-H2 120.

Although X-ray crystallography of complexes 2a-2d was not feasible due to insufficient quality of the crystals, the $\mathrm{PEt}_{3}{ }^{-}$ co-ordinated analogue, $\left[\mathrm{RhCl}\left(\eta^{2}-\mathrm{CH}_{2}=\mathrm{CCH}_{2} \mathrm{CHC}_{6} \mathrm{H}_{4} \mathrm{Me}-p\right)\right.$ $\left.\left(\mathrm{PEt}_{3}\right)_{2}\right] 3 \mathbf{c}$ was prepared from the reaction of 1-methylene-2( $p$-methylphenyl)cyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PEt}_{3}\right)_{3}\right]$ and characterized by X-ray crystallography. The reaction shown in eqn. (4)

does not give any other products via ring opening isomerization of the substrate. Fig. 2 depicts the molecular structure of 3c. It reseals square-planar co-ordination around the Rh that is bonded to the $\eta^{2}$-olefinic group of the ligand. The $p$-methylphenyl group of the ligand is situated at the opposite side of the Rh . The $\mathrm{C}=\mathrm{C}$ double bond is orientated perpendicular to the co-ordination plane and elongated from a typical $\mathrm{C}=\mathrm{C}$ double bond [C1-C2 1.405(9) Å]. Deviation of the C=C double bond from the cyclopropane plane ( $c a .135^{\circ}$ ) caused by back donation from Rh to the ligand seems to release a part of the strain energy of unco-ordinated 1-methylene-2-( $p$-methylphenyl)cyclopropane.

The NMR data of complex 3c shown below indicate its similar structure to those of $\mathrm{PPh}_{3}$ co-ordinated complexes $\mathbf{2 a}-$ 2d. The ${ }^{13} \mathrm{C}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR signals of two vinylic carbons at $\delta 26.6$ and 56.1 are accompanied by large $J(\mathrm{RhC})(66$ and 22 Hz , respectively). The vinylic hydrogen signals are observed at high magnetic field similarly to those of 2a-2d, while the position of one of the signals was determined from the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ COSY spectrum due to their severe overlapping with the signals of phosphine ligands. The ${ }^{31} \mathrm{P}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of 3 c contains an AB pattern with $J(\mathrm{PP})=415 \mathrm{~Hz}$ as depicted in Fig. 3. Two $P$ nuclei are magnetically inequivalent arising from $\eta^{2}$ coordination of unsymmetrically substituted methylenecyclopropane.

Fig. 3 The ${ }^{31} \mathrm{P}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of complex 3 c ( 160 MHz in $\mathrm{C}_{6} \mathrm{D}_{6}$ ) at room temperature. Chemical shifts are referenced to external $\mathrm{H}_{3} \mathrm{PO}_{4}$.

Fig. 4 Van't Hoff plots of the reactions (a) $\mathbf{2 a}+\mathrm{CH}_{2}=\widehat{\mathrm{CHH}_{2} \mathrm{C}} \mathrm{H}-$ $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{~F}-p \longrightarrow \mathbf{2 b}+\mathrm{CH}_{2}=\overparen{\mathrm{CCH}_{2}} \mathrm{CHC}_{6} \mathrm{H}_{5}$ and (b) $\mathbf{2 a}+\mathrm{CH}_{2}=\overparen{\mathrm{CCH}_{2} \mathrm{C}} \mathrm{H}-$ $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Me}-p \longrightarrow \mathbf{2 c}+\mathrm{CH}_{2}=\mathrm{CCH}_{2} \mathrm{CHC}_{6} \mathrm{H}_{5}$.

## Associative exchange of $\boldsymbol{\pi}$-co-ordinated ligand of complex 2a

Addition of 1-aryl-2-methylenecyclopropanes to a benzene- $d_{6}$ solution of complex 2a caused partial conversion of the complex into $\mathbf{2 b} \mathbf{- 2 d}$ accompanied by liberation of 1-methylene-2phenylcyclopropane. The ${ }^{1} \mathrm{H}$ NMR spectra of solutions containing 2a, 1-methylene-2-phenylcyclopropane and a 1-aryl-2methylenecyclopropane show reversible and rapid exchange between the olefin co-ordinated to Rh and that in solution as shown in eqn. (5). The equilibrium constants were obtained by

comparison of the ${ }^{1} \mathrm{H}$ NMR peak area ratios of the mixtures in the temperature range $30-45^{\circ} \mathrm{C}$. The temperature dependence of the equilibrium constants shown in Fig. 4 gives the thermodynamic parameters of the reactions, $\Delta H^{\circ}=-10.3 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $\Delta S^{\circ}=-32 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ for $\mathrm{Ar}=\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{~F}-p$ and $\Delta H^{\circ}=2.2 \mathrm{~kJ}$ $\mathrm{mol}^{-1}$ and $\Delta S^{\circ}=-2.6 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ for $\mathrm{Ar}=\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Me}-p$, respectively, at 298 K . Although the reaction of 1-(p-methoxyphenyl)-2-methylenecyclopropane with 2 a proceeds smoothly to result in exchange of the ligand, an accompanying ring opening isomerization of the substrate to give 1d prevented determin-

Fig. 5 Plots of the products of the reaction of 1-methylene-2-phenylcyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right](5: 1)$ at $50{ }^{\circ} \mathrm{C}$. Relative amounts of (a) 1-methylene-2-phenylcyclopropane, (b) 2-phenylbuta-1,3-diene, (c) 1a, and (d) 2a to the initial amount of $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ are shown.
ation of the precise equilibrium constants. Comparison of $\Delta H^{\circ}$ values of the two above reaction systems indicates that the $\eta^{2}$ co-ordination of 1-aryl-2-methylenecyclopropanes to Rh is stabilized by the presence of the electron withdrawing substituent on the aryl group.

## Mechanism of the ring opening isomerization

As shown above, the reactions of 1-aryl-2-methylenecyclopropanes with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at 50 and at $0{ }^{\circ} \mathrm{C}$ gave the 2-arylbuta-1,3-diene- and the 1-aryl-2-methylenecyclopropane-co-ordinated rhodium complexes, respectively. 1-Methylene-2phenylcyclopropane reacts with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $25^{\circ} \mathrm{C}$ to give a mixture of 1a and 2a in a 47:53 molar ratio. Similar reaction of 1-(p-fluorophenyl)-2-methylenecyclopropane and of 1-( $p$ -methoxyphenyl)-2-methylenecyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ afforded a mixture of $\mathbf{1 b}$ and $\mathbf{2 b}(54: 46)$ and $\mathbf{1 d}$ and $\mathbf{2 d}(55: 45)$, respectively. Several additional experiments were conducted to elucidate detailed pathways of formation of these products.

The change in the amounts of organic and inorganic products during the reaction of 1-methylene-2-phenylcyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ was monitored at $50{ }^{\circ} \mathrm{C}$ by ${ }^{1} \mathrm{H}$ NMR spectroscopy to obtain mechanistic insights into the ring opening isomerization pathway. Fig. 5 shows plots of the increase in 1a and 2-phenylbuta-1,3-diene which reached 55 and $165 \%$ per Rh , respectively, after the reaction for 4.5 h . The ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR signals of $\left[\mathrm{Rh}_{2}(\mu-\mathrm{Cl})_{2}\left(\mathrm{PPh}_{3}\right)_{4}\right]$ and polymer of 2-phenylbuta-1,3-diene ${ }^{21}$ were also observed during the reaction although the amounts were not included in Fig. 5. The reactions of 2 a at $50^{\circ} \mathrm{C}$ were examined to compare its reactivity with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ toward 1,3-diene formation. Heating of a benzene solution of 2 a for 7 h at $50^{\circ} \mathrm{C}$ led to the formation of 1a in a low NMR yield ( $<7 \%$ ) and a negligible amount of 2 -phenylbuta-1,3-diene. The reaction of $\mathbf{2 a}$ with 1 -methylene-2-phenylcyclopropane ( $1: 5$ molar ratio) at $50^{\circ} \mathrm{C}$ gave 1a ( $10 \%$ ) and 2-phenylbuta-1,3-diene ( $14 \%$ per Rh) after 6 h . The amounts of the products formed via ring-opening isomerization of the substrate are much smaller than those in the reaction of 1-methylene-2-phenylcyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ under similar conditions ( 55 and $165 \%$ ).

Scheme 2 summarizes several possible routes for the ring opening isomerization of 1-aryl-2-methylenecyclopropanes promoted by rhodium(I) complexes. Oxidative addition of a $\mathrm{C}-\mathrm{C}$ bond of the substrate to $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ (i) will give $\mathbf{1}$ directly. Reactions (ii) and (iii) involving initial co-ordination of the $\mathrm{C}=\mathrm{C}$ double bond to Rh and the reaction of the 1-aryl-2methylenecyclopropane with the formed 2 also account for formation of the product. The reaction (iii) should be accom-

Scheme 2
panied by more rapid associative exchange of the ligand (iii') because complex 2a undergoes exchange of the $\pi$-co-ordinated ligand even at room temperature. Direct conversion of $\mathbf{2}$ into $\mathbf{1}$ via intramolecular $\mathrm{C}-\mathrm{C}$ bond activation of the co-ordinated 1-aryl-2-methylenecyclopropane (iv) will provide the ring opening isomerization products. The reactions (ii)-(iv) are slower than (i) since heating of $\mathbf{2 a}$ and of a mixture of $\mathbf{2 a}$ and 1-methylene-2-phenylcyclopropane forms the 1,3-diene product in low yields. As suggested in Fig. 5, initially formed $\mathbf{2}$ is further converted into $\mathbf{1}$ or 2 -phenylbuta-1,3-diene under the conditions. Another pathway involving regeneration of $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ from the reaction of 2 and $\mathrm{PPh}_{3}$ and its reaction with the substrate is also to be considered. However, addition of $\mathrm{PPh}_{3}$ to the reaction mixture of 2a and 1-methylene-2-phenylcyclopropane
$\qquad$

Scheme 3
at $50^{\circ} \mathrm{C}$ caused inhibition of formation of $\mathbf{1 a}$ and of 2-phenylbuta-1,3-diene. The mechanism in Scheme 3 accounts for all the above results. Dissociation of a $\mathrm{PPh}_{3}$ ligand from [ $\left.\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ and of 1-aryl-2-methylenecyclopropane ligand from 2 gives $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{2}\right.$ (solv)] (solv = solvent) that is responsible for oxidative addition of a $\mathrm{C}-\mathrm{C}$ bond of the substrate giving 1 or 2-phenylbuta-1,3-diene. Addition of $\mathrm{PPh}_{3}$ to the reaction mixture will turn a labile $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{2}(\right.$ solv $\left.)\right]$ species present into $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ that shows much less reactivity toward the activation of the $\mathrm{C}-\mathrm{C}$ bond.

The present study has revealed the reaction of 1-aryl-2methylenecyclopropanes with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ to give the ring opening isomerization product or a complex having the substrate as the $\eta^{2}$-bonded ligand depending on the conditions. Ring opening isomerization occurs at higher temperature than simple $\pi$ co-ordination of the substrate, but heating of the $\pi$-co-ordinated rhodium complex does not give the ring opened products.

## Experimental

## General considerations, measurements and materials

Manipulations of the rhodium complexes were carried out under nitrogen or argon using standard Schlenk techniques. The NMR spectra $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C}\right.$, and $\left.{ }^{31} \mathrm{P}\right)$ were recorded on a JEOL EX- 400 spectrometer at $25^{\circ} \mathrm{C}$ unless otherwise stated; ${ }^{31} \mathrm{P}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR peaks were referenced to external $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$. Elemental analyses were carried out by a Yanaco MT-5 CHN autocorder. The complex $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right.$ ] and 1-aryl-2-methylenecyclopropanes were prepared according to the literature, ${ }^{22}\left[\mathrm{RhCl}\left(\mathrm{PEt}_{3}\right)_{3}\right]$ from the reaction of $\mathrm{PEt}_{3}$ with $\left[\left\{\mathrm{RhCl}\left(\mathrm{C}_{8} \mathrm{H}_{14}\right)\right\}_{2}\right]\left(\mathrm{C}_{8} \mathrm{H}_{14}=\right.$ cyclooctene). ${ }^{23} \quad 1$-( $p$-Fluorophenyl)-2-methylenecyclopropane: $\delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 0.90\left(1 \mathrm{H}\right.$, dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,5$ and 10), 1.41 $\left(1 \mathrm{H}\right.$, dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,9$ and 10), $2.26(1 \mathrm{H}$, dddd, cyclo$\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,5$ and 9 Hz ), $5.52(\mathrm{~m}, 2 \mathrm{H}$, vinyl) and 6.72-6.83 $\left(4 \mathrm{H}, \mathrm{m}, \mathrm{C}_{6} \mathrm{H}_{4}\right)$. 1-Methylene-2-( $p$-methylphenyl)cyclopropane: $\delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 1.05\left(1 \mathrm{H}\right.$, dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,5$, and 9$), 1.47$ ( 1 H , dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}, J$ 2, 2, 9 and 10), 2.11 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{Me}$ ), 2.42 (dddd, 1 H, cyclo $-\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,5$ and 10 Hz$), 5.52-5.55(2 \mathrm{H}, \mathrm{m}$, vinyl) and 7.02-7.04 ( $4 \mathrm{H}, \mathrm{m}, \mathrm{C}_{6} \mathrm{H}_{4}$ ). 1-( $p$-Methoxyphenyl)-2 methylenecyclopropane: $\delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 1.05\left(1 \mathrm{H}\right.$, dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}$, $J 2,2,5$, and 9), $1.46\left(1 \mathrm{H}\right.$, dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,9$ and 10 ), $2.41\left(1 \mathrm{H}\right.$, dddd, cyclo- $\mathrm{C}_{3} \mathrm{H}_{3}, J 2,2,5$ and 10 Hz ), $3.31(3 \mathrm{H}, \mathrm{s}$, $\mathrm{OMe})$, $5.52-5.55\left(2 \mathrm{H}, \mathrm{m}\right.$, vinyl) and 6.73-7.04 ( $4 \mathrm{H}, \mathrm{m}, \mathrm{C}_{6} \mathrm{H}_{4}$ ).

## Preparations

Complexes 1a-1d. To a toluene ( $4 \mathrm{~cm}^{3}$ ) solution of $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right](193 \mathrm{mg}, 0.21 \mathrm{mmol})$ was added 1-methylene-2phenylcyclopropane ( $135 \mathrm{mg}, 1.04 \mathrm{mmol}$ ) at $50^{\circ} \mathrm{C}$. The solution changed from red to orange during the reaction. After 16 h the
solvent was removed by evaporation. Addition of hexane to the orange product led to separation of a yellow solid, which was collected by filtration and dried in vacuo to give complex 1a (157 mg, $95 \%$ ) (Found: C, 69.75; H, 5.95; Cl, 4.22. $\mathrm{C}_{46} \mathrm{H}_{40} \mathrm{ClP}_{2} \mathrm{Rh}$ requires C, 69.66 ; $\mathrm{H}, 5.08, \mathrm{Cl}, 4.47 \%)$. $\delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right)-0.56(1 \mathrm{H}, \mathrm{br}$, $H^{d}$ or $\left.H^{e}\right), 0.58\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{b}}\right), 0.77\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{e}}\right.$ or $\left.\mathrm{H}^{\mathrm{d}}\right), 3.56(1 \mathrm{H}$, $\left.\mathrm{br}, \mathrm{H}^{\mathrm{a}}\right)$, $5.45\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{c}}\right), 6.81-6.96(21 \mathrm{H}, \mathrm{m}), 7.43(6 \mathrm{H}, \mathrm{t}, J 8$ $\mathrm{Hz})$, $7.78(6 \mathrm{H}, \mathrm{br})$ and $8.08(2 \mathrm{H}, \mathrm{br}) . \delta_{\mathrm{C}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 38.7\left(\mathrm{~d}, \mathrm{C}^{4}\right.$, $J 11), 48.3\left(\mathrm{dd}, \mathrm{C}^{1}, J 53\right.$ and 11 Hz ), $87.8\left(\mathrm{~s}, \mathrm{C}^{3}\right), 113.0\left(\mathrm{~s}, \mathrm{C}^{2}\right)$, 128.2, 128.7, 128.8, 129.1, 129.4, 131.8, 132.6, 132.7, 134.9, 135.7, 136.0, 137.5, 137.8 and 138.0. $\delta_{\mathrm{P}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 23.1$ [d, $J(\mathrm{PRh})$ 121] and 35.1 [d, $J(\mathrm{PRh}) 180 \mathrm{~Hz}$. Coupling due to a small $J(\mathrm{PP})(<8 \mathrm{~Hz})$ was observed depending on the measurement conditions (Chart 1).

Chart 1 Numbering scheme of complexes 1a-1d.

The reactions of 1-methylene-2-(p-methylphenyl)cyclopropane and of 1-(p-methoxyphenyl)-2-methylenecyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ gave similar butadiene co-ordinated complexes 1c and 1d which were recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}-$ hexane. Complex 1b was isolated from the reaction of 1-(p-fluorophenyl)-2-methylenecyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $25^{\circ} \mathrm{C}$ followed by repeated recrystallization of the product. Complex 1b (yield 24\%) (Found: C, 68.29; H, 5.43; Cl, 4.23; F, 2.16. $\mathrm{C}_{46} \mathrm{H}_{39} \mathrm{ClFP}_{2} \mathrm{Rh}$ requires $\mathrm{C}, 68.12 ; \mathrm{H}, 4.85 ; \mathrm{Cl}, 4.37 ; \mathrm{F}$, $2.34 \%): \delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right)-0.56\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{d}}\right.$ or $\left.\mathrm{H}^{\mathrm{e}}\right), c a .0 .5(1 \mathrm{H}, \mathrm{br}$, $\left.\mathrm{H}^{\mathrm{b}}\right)$, ca. $0.8\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{e}}\right.$ or $\left.\mathrm{H}^{\mathrm{d}}\right), 3.44\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{a}}\right), 5.34(1 \mathrm{H}, \mathrm{br}$, $\left.\mathrm{H}^{\mathrm{c}}\right), 6.83-7.12(20 \mathrm{H}, \mathrm{m}), 7.41(6 \mathrm{H}, \mathrm{br})$ and 7.72-7.87 ( $\left.8 \mathrm{H}, \mathrm{br}\right)$; $\delta_{\mathrm{P}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 22.9$ [d, $\left.J(\mathrm{PRh}) 121\right]$ and 34.7 [d, $\left.J(\mathrm{PRh}) 180 \mathrm{~Hz}\right]$. Complex 1c (yield 72\%) (Found: C, 67.74; H, 5.39; Cl, 7.71. $\mathrm{C}_{47} \mathrm{H}_{42} \mathrm{ClP}_{2} \mathrm{Rh} \cdot 0.5 \mathrm{CH}_{2} \mathrm{Cl}_{2}$ requires C, $67.15 ; \mathrm{H}, 4.99 ; \mathrm{Cl}$, $8.35 \%): \delta_{\mathrm{H}}-0.49\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{d}}\right.$ or $\left.\mathrm{H}^{\mathrm{e}}\right), 0.56\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{b}}\right), 0.82$ $\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{e}}\right.$ or $\left.\mathrm{H}^{\mathrm{d}}\right), 3.55(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 3.59\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{a}}\right), 5.48$ $\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{c}}\right), 6.84(10 \mathrm{H}, \mathrm{br}), 6.86(10 \mathrm{H}, \mathrm{br}), 7.45(6 \mathrm{H}, \mathrm{br}), 7.78$ $(6 \mathrm{H}, \mathrm{br})$ and $8.02(2 \mathrm{H}, \mathrm{br}) ; \delta_{\mathrm{P}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 23.6[\mathrm{~d}, J(\mathrm{PRh}) 117]$ and 34.7 [d, $J(\mathrm{PRh}) 184 \mathrm{~Hz}]$. Complex 1d (yield 77\%) (Found: C, 63.12; $\mathrm{H}, 5.02 . \mathrm{C}_{47} \mathrm{H}_{42} \mathrm{ClOP}_{2} \mathrm{Rh} \cdot \mathrm{CH}_{2} \mathrm{Cl}_{2}$ requires C, $63.49 ; \mathrm{H}$, $4.88 \%): \delta_{\mathrm{H}}-0.53\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{d}}\right.$ or $\left.\mathrm{H}^{\mathrm{e}}\right), 0.56\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{b}}\right), 0.80$ $\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{e}}\right.$ or $\left.\mathrm{H}^{\mathrm{d}}\right), 3.62\left(1 \mathrm{H}\right.$, br, $\left.\mathrm{H}^{\mathrm{a}}\right)$, $5.49\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{c}}\right), 6.86-$ $6.97(20 \mathrm{H}, \mathrm{m}), 7.45(6 \mathrm{H}, \mathrm{t}, J 7 \mathrm{~Hz}), 7.79(6 \mathrm{H}, \mathrm{br})$ and 8.02 $(2 \mathrm{H}, \mathrm{br}) ; \delta_{\mathrm{P}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 24.9$ [d, $\left.J(\mathrm{PRh}) 121\right]$ and 36.4 [d, $J(\mathrm{PRh})$ 180 Hz ].
Complexes 2a-2d. To a toluene ( $7 \mathrm{~cm}^{3}$ ) solution of $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right](860 \mathrm{mg}, 0.93 \mathrm{mmol})$ was added 1-methylene-2phenylcyclopropane ( $605 \mathrm{mg}, 4.6 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$. Stirring the solution for 4 h at that temperature caused precipitation of a yellow solid. After 24 h the solid product was collected by filtration, washed with $\mathrm{Et}_{2} \mathrm{O}$ and then with hexane, and dried in vacuo to give complex $\mathbf{2 a}$ as a yellow microcrystalline solid (500 $\mathrm{mg}, 68 \%$ ) (Found: C, 69.55 ; H, 5.15. $\mathrm{C}_{46} \mathrm{H}_{40} \mathrm{ClP}_{2} \mathrm{Rh}$ requires C, $69.66 ; \mathrm{H}, 5.08 \%) . \delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 0.37\left[1 \mathrm{H}, \mathrm{dd}, \mathrm{Hd}, J\left(\mathrm{H}^{\mathrm{c}} \mathrm{H}^{\mathrm{d}}\right) 6\right.$, $\left.J\left(\mathrm{H}^{\mathrm{d}} \mathrm{H}^{\mathrm{e}}\right) 5\right], 1.89\left[1 \mathrm{H}, \mathrm{dd}, \mathrm{H}^{\mathrm{c}}, J\left(\mathrm{H}^{\mathrm{c}} \mathrm{H}^{\mathrm{d}}\right) 6, J\left(\mathrm{H}^{\mathrm{c}} \mathrm{H}^{\mathrm{e}}\right) 9\right], 2.27(1 \mathrm{H}$, br, $\mathrm{H}^{\mathrm{a}}$ or $\left.\mathrm{H}^{\mathrm{b}}\right), 2.34\left(1 \mathrm{H}, \mathrm{br}, \mathrm{H}^{\mathrm{a}}\right.$ or $\left.\mathrm{H}^{\mathrm{b}}\right), 2.71\left[1 \mathrm{H}, \mathrm{dd}, \mathrm{H}^{\mathrm{e}}, J\left(\mathrm{H}^{\mathrm{c}} \mathrm{H}^{\mathrm{e}}\right.\right.$ 9, $J\left(\mathrm{H}^{\mathrm{d}} \mathrm{H}^{\mathrm{e}}\right) 5$ 5, , 6.57-6.69 ( $2 \mathrm{H}, \mathrm{m}$ ), 6.81-7.08 ( $21 \mathrm{H}, \mathrm{m}$ ), 7.87 $(6 \mathrm{H}, \mathrm{t}, J 8)$ and $8.01(6 \mathrm{H}, \mathrm{t}, J 7 \mathrm{~Hz}) . \delta_{\mathrm{C}}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right) 27.2\left[\mathrm{~d}, \mathrm{C}^{3}\right.$, $J(\mathrm{CRh}) 6$ ], 29.6 [d, $\left.\mathrm{C}^{4}, J(\mathrm{CRh}) 4\right], 34.2$ [d, $\left.\mathrm{C}^{1}, J(\mathrm{CRh}) 13\right], 61.5$ [d, $\mathrm{C}^{2}, J(\mathrm{CRh}) 22$ ], $124.8\left(\mathrm{C}_{6} \mathrm{H}_{5}\right.$ of 1-methylene-2-phenylcyclopropane), 125.8 (d, $J 33$ ), 127.8, 128.5, $129.3\left(\mathrm{C}_{6} \mathrm{H}_{5}\right.$ of 1-methylene-2-phenylcyclopropane), 129.8 (d, $J 25$ ), 133.0 ( $\mathrm{t}, J 21$ and 9), 133.3 (t, $J 21$ and 9), 135.6 (dd, $J 9$ and 4), 135.9 (dd, $J 9$ and 4 Hz$), 137.8\left(\mathrm{C}_{6} \mathrm{H}_{5}\right.$ of 1-methylene-2-phenylcyclopropane) and $144.7\left(\mathrm{C}_{6} \mathrm{H}_{5}\right.$ of 1-methylene-2-phenylcyclopropane); $\delta_{\mathrm{P}}$

| ${ }^{a}$ Hexane solvated form. |  |  |

off-white solid which was collected by filtration and dried in vacuo. The IR spectrum of the solid product was identical with that of authentic $\left[\mathrm{RhCl}(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}\right]$. The ${ }^{1} \mathrm{H}$ NMR analyses of the filtrate showed formation of 1-methylene-2-phenylcyclopropane in a quantitative amount.

## Reaction of 1-aryl-2-methylenecyclopropanes with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ at $25{ }^{\circ} \mathrm{C}$

To a toluene $\left(4 \mathrm{~cm}^{3}\right)$ solution of $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right](141 \mathrm{mg}, 0.15$ mmol ) was added 1-methylene-2-phenylcyclopropane ( 99 mg , $0.76 \mathrm{mmol})$ at $25^{\circ} \mathrm{C}$. The solution changed from red to orange. After 20 h the solvent was removed under vacuum. Addition of hexane to the product led to separation of a yellow solid (132 mg ) whose ${ }^{1} \mathrm{H}$ NMR spectrum indicated the presence of complexes 1a and 2a in a 47:53 ratio. Similar reaction of 1-( $p$ -fluorophenyl)-2-methylenecyclopropane and of 1-(p-methoxy-phenyl)-2-methylenecyclopropane with $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ afforded a mixture of 1b and 2b ( $54: 46$ ) and 1d and 2d ( $55: 45$ ), respectively.

## Equilibrium constant measurement

To a benzene- $d_{6}(0.426 \mathrm{~g})$ solution of complex 2a $(19.4 \mathrm{mg}$, 0.024 mol ) were added 1-methylene-2-phenylcyclopropane ( $29.8 \mathrm{mg}, 0.23 \mathrm{mmol}$ ) and 1 -( $p$-fluorophenyl)-2-methylenecyclopropane ( $38.3 \mathrm{mg}, 0.26 \mathrm{mmol}$ ) in an NMR sample tube. Then the NMR spectra were recorded at $30,35,40$ and $45^{\circ} \mathrm{C}$. The molar ratio of $\mathbf{2 a}$ and $\mathbf{2 b}$ in the equilibrium mixtures was determined by comparison of the peak area of cyclopropane ring hydrogens ( $\delta 2.59$ and 2.71). Equilibrium constants between 2a and $\mathbf{2 c}$ were obtained from the peak intensity of the methyl hydrogens of $\mathbf{2 c}$ and the other signals. The equilibrium constants at each temperature in the reaction of 1-( $p$ -fluorophenyl)-2- methylenecyclopropane and of 1-methylene-2( $p$-methylphenyl)cyclopropane with $\mathbf{2 a}$ shown in eqn. (5) were 1.206 (30), 1.118 (35), 1.048 (40) and 0.988 (45) and 0.303 (30), $0.310(35), 0.312(40)$ and $0.317\left(45^{\circ} \mathrm{C}\right)$, respectively.

NMR study of the reaction of 1-methylene-2-phenylcyclopropane
with $\left[\operatorname{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$
To a benzene- $d_{6}\left(c a .0 .5 \mathrm{~cm}^{3}\right)$ solution of $\left[\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ (31.8 $\mathrm{mg}, 0.034 \mathrm{mmol}$ ) was added 1-methylene-2-phenylcyclopropane $(22.6 \mathrm{mg}, 0.17 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$. The NMR spectra were recorded every 10 min at $50^{\circ} \mathrm{C}$.

## Crystallography

Recrystallization of complex $\mathbf{1 c}$ from a THF-hexane mixture gave single crystals in a hexane solvated form, $\mathbf{1 c} \cdot 0.5 \mathrm{C}_{6} \mathrm{H}_{14}$. Orange single crystals of $\mathbf{3 c}$ were obtained by recrystallization from $\mathrm{Et}_{2} \mathrm{O}$. The crystals were sealed in a glass capillary tube under argon and applied to data collection at $25^{\circ} \mathrm{C}$. Full-matrix least squares refinement was carried out with all the nonhydrogen atoms anisotropic. Vinyl hydrogens of $\mathbf{3 c}$ were located in the final electron density map, while other hydrogens were situated at calculated positions. The hydrogens were included in the structure calculation without further refinement of the positional parameters. Crystal data and details of refinement are summarized in Table 2.

CCDC reference number 186/1335.
