(b) With a slightly different algorithm i.e.

$$x = P^{2} - Q^{2} - R^{2},$$
  

$$y = 2PQ,$$
  

$$z = 2PR.$$

We find for x = 495, y = 840, z = 448,

$$x^{2} + y^{2} + z^{2} = 1073^{2}$$
,  $x^{2} + y^{2} = 975^{2}$ ,  $z^{2} + y^{2} = 952^{2}$ ,

 $x^2 + z^2$  not a square.

- (c) The sets (1008, 1100, 1155) and (1008, 1100, 12075) have two numbers in common.
- (d) There are several sets of (x, y, z) which have one value in common e.g. (2964, 9152, 9405), (2964, 6160, 38475) and (5643, 43680, 76076), (5643, 14160, 21476).

## Some Designs for Maximal (+1, -1)-Determinant of Order $n \equiv 2 \pmod{4}$

## By C. H. Yang

When  $n \equiv 2 \pmod{4}$ , Ehlich [1] has shown that

(i) the maximal absolute value  $\alpha_n$  of nth order determinant with entries  $\pm 1$  satisfies

$$\alpha_n^2 \le 4(n-2)^{n-2}(n-1)^2 = \mu_n$$

(ii) matrices  $M_n$  of the maximal *n*th order (+1, -1)-determinant whose absolute value equals  $\mu_n^{1/2}$  exist for  $n \leq 38$ , provided that " $(n-1, -1)_p = 1$  (Hilbert's symbol) for any prime p," which is also equivalent to "any prime factor of squarefree part of n-1 is not congruent to  $3 \pmod{4}$ ."

It is found that  $M_{42}$ ,  $M_{46}$  also exist by Ehlich's method and such maximal matrices  $M_n$  are likely to exist for all  $n \equiv 2 \pmod{4}$  if  $(n-1,-1)_p = 1$  for any prime p. This means that for n < 200, all such matrices are likely to be found except for n = 22, 34, 58, 70, 78, 94, 106, 130, 134, 142, 162, 166, 178, and 190.

The maximal matrix  $M_n$  such that

$$M_n \ {M_n}^T = egin{pmatrix} P & 0 \ 0 & P \end{pmatrix}, \qquad ext{where } P = egin{bmatrix} n & 2 \ \cdot & \cdot & \\ & \cdot & \cdot & \\ & & \cdot & \\ 2 & & n \end{pmatrix}$$

148 C. H. YANG

and  $M_n^T$  = the transpose of  $M_n$ , can be constructed from the following (cf. Ehlich [1]):

$$M_n = \begin{pmatrix} A_1 & A_2 \\ -A_2^T & A_1^T \end{pmatrix},$$

where  $A_1$ ,  $A_2$  are circulant matrices of order n/2.

For n = 42, 46, the designs for the maximal matrices  $M_n$  are:

where - stands for -1, + for +1.

Another design for n = 38 is found as follows:

For n = 50, the maximal matrix  $M_n$  can be constructed by taking  $A_1 = A_2 =$  the matrix of Raghavarao [3], without circulancy.

As noted in the design of above maximal matrices, the numbers  $n_1$  and  $n_2$  of -1's respectively in each row of  $A_1$  and  $A_2$  can not be arbitrary. For example, when n = 38;  $n_1$ ,  $n_2$  must be either 6 or 7, provided  $n_1$ ,  $n_2 < n/4$ . Similarly, when n = 42;  $n_1$ ,  $n_2$  must be either 6 or 10: when n = 46; either 7 or 10.

For  $54 \le n < 200$ , the following table of  $n_1$  and  $n_2$  is helpful to construct the maximal matrices.  $(n_1, n_2 < n/4)$ 

n	54	62	66	74	82	86	90	98	102	110	114	118	122	126	
$n_1$	9	10	12 (11)	13	16	16 (15)	16	18	20	21	21	22	25	<b>2</b> 5	(24)
$n_2$	11	15	13 (15)	16	16	18 (21)	21	22	21	24	28	28	25	27	(29)

$\overline{n}$	138	146	150	154	158	170	174	182	186	194	198
_	27	30	29	31	31	34 (36)	36	36	38 (37)	39	42
$n_2$	31	31	36	34	37	39 (36)	38	45	42 (45)	46	43
