CONFERENCE BOARD OF THE MATHEMATICAL SCIENCES
REGIONAL CONFERENCE SERIES IN MATHEMATICS

Number 10

114 Pages; List Price \$4.50; Individual Price \$3.38

This survey deals mostly with rather elementary mathematics, so elementary in fact that most of its results and problems are (or at least should be) understandable to undergraduates. It was written out of the conviction that many neglected aspects of elementary geometry deserve a wider dissemination because of their inherent beauty and interest, and for the inspiration and understanding they can impart to students and mathematicians. Throughout the survey, many conjectures are explicitly stated, and many additional problems are hinted at. The subject obviously offers extremely varied opportunities for research. Due to the elementary nature of the topic, the solutions of many of the open problems will probably require more inspiration than erudition, but that is a hallmark of beauty in mathematics.

Self-contained Up-to-date Problem-packed Illustrated and in plain English*

*Just a few of the features in these four new computer texts from Prentice-Hall

ITERATIVE METHODS FOR NONLINEAR OPTIMIZATION PROBLEMS by Samuel L. S. Jacoby, Janusz S. Kowalik, both of Boeing Computer Services, Inc. and Joseph T. Pizzo of The Boeing Company. A self-contained, unified description in algorithmic fashion of the currently available techniques in the areas of mathematical programming and unconstrained optimization. Its upto-date coverage includes derivations of major techniques, details of the iteration steps, convergence criteria, accelerating devices, and discussions of the techniques.

1972 approx. 304 pp. 013-508119-X

INTRODUCTION TO COMPUTA-TIONAL METHODS FOR STUDENTS OF CALCULUS by Samuel S. McNeary, Drexel University. Written primarily for a course in computational methods that is given parallel to the freshman calculus course. The interplay between these two courses should not only result in a development of computational skills, but also provide an understanding of the basic concepts of analysis. Provides an outline of FORTRAN language. The text material is amply illustrated with figures and problems. 1972 арргох. 208 рр. 013-479501-6 THE THEORY OF PARSING, TRANSLATION AND COMPILING, VOL I: PARSING by Alfred V. Aho, Bell Telephone Laboratories, and Jeffery D. Ullman, Princeton University. A comprehensive, self-contained treatment of compiler theory emphasizing parsing and the theoretical background. Presents principles rather than details specific to a given language or machine. Complete coverage of all important parsing algorithms, including the LL, LR, precedence and Earley's method. Many problems are included with each section. All algorithms are clearly stated. 1972 арргож. 592 рр. 013-94556**-7**

BASIC DATA PROCESSING MATHE-MATICS by James A. Saxon. Saxon Research Corp. Designed to teach the fundamentals of data processing mathematics, particularly to business majors who do not have a very heavy grounding in math. Relates math concepts to business applications. Explains necessary equations in plain English.

4/72 244 pp. 013-058909-8

mathematical title service

You can't read two hundred journals a month and pinpoint the specific articles related to your own work. Let the Mathematical Title Service do it for you!!! For \$0.10 each, we can send you title listings which include author's name, title of article, source journal with volume, year, issue, pages, and all primary and secondary classification numbers. The only thing we need from you is a profile of your interests and a deposit balance of \$30. The computer helps us—let us help you. Drop us a postcard, and you will receive complete information posthaste.

index of mathematical papers

Your reference library will not be complete without IMP! This new index series is scheduled to appear every six months after publication of the first three issues. It will be arranged by author(s) and subject, and it will provide your readers with approximately 5,000 bibliographic references (per issue) in all areas of pure mathematics; important topics in applied mathematics and mathematical physics; and mathematical applications in the other physical, biological, and social sciences. This is a current index, covering over half of the journals now reviewed in full by Mathematical Reviews. Expected publication dates of the first two volumes appear below. Standing orders are invited. No discount is offered on these publications.

Volume 1, July—December 1970 \$30 (June 1972)
Volume 2, Issue 1, January—June 1971 30 (September 1972)
Volume 2, Issue 2, July—December 1971 30 (November 1972)

TABLE OF DENSITY BOUNDS FOR BULER'S FUNCTION

Charles R. Wall

East Texas State University

This table is a supplement to "Density bounds for Euler's function", (Math. Comp., this issue, p. 779-783).

Let X denote the density, if it exists, of a set X of positive integers, and let φ be Buler's function,

$$\phi(n) = n \prod_{p \mid n} (1 - p^{-1}),$$

the product taken over primes $\,p\,$ which divide $\,n\,$. This table gives upper and lower bounds for

$$D(x) = \{ n : \phi(n)/n \le x \}$$

for x = 0 (.001) 1.

The table consists of five columns. The first column lists 1000~x, while the second and third give the corresponding lower and upper bounds, respectively. The fourth and fifth columns list respectively integers A and B such that A $\leq 223092870~D(x) \leq B$.

The bounds near x = 1 and x = .5 were revised for the paper referred to earlier; the procedure was given in the paper.

This research was supported by an East Texas State University Research Grant.
