

On the Largest Zeroes of Orthogonal Polynomials for Certain Weights

By D. S. Lubinsky* and A. Sharif

Abstract. The asymptotic growth of the largest zero of the orthogonal polynomials for the weights $W(x) = |x|^b \exp(-k |\log |x||^c)$ is investigated.

1. Introduction. Freud [3], [4] investigated the largest zeroes of orthogonal polynomials for weights on $(-\infty, \infty)$. Nevai and Dehesa [5] studied the sums of powers of zeroes of orthogonal polynomials. Here we investigate the asymptotic growth of the largest zeroes for the weights

$$(1.1) \quad W(x) = |x|^b \exp(-k |\log |x||^c), \quad x \in (-\infty, \infty)$$

where $c > 1; k > 0; b \in (-\infty, \infty)$

and

$$(1.2) \quad W(x) = \begin{cases} x^b \exp(-k |\log x|^c), & x \in (0, \infty), \\ 0, & x \in (-\infty, 0], \end{cases}$$

where $c > 1; k > 0; b \in (-\infty, \infty)$.

When $c = 2$ and $b = 0$ in (1.2), $W(x)$ yields the Stieltjes-Wigert polynomials (Chihara [1, 2]), and Chihara [2] has remarked that very little is known about their zeroes.

2. Notation. Given a nonnegative measurable function $W(x)$ on $(-\infty, \infty)$ for which all moments

$$\mu_n(W) = \int_{-\infty}^{\infty} x^n W(x) dx, \quad n = 0, 1, 2, \dots,$$

exist, its orthogonal polynomials are

$$p_n(W; x) = \gamma_n(W) \prod_{j=1}^n (x - x_{jn}(W)), \quad n = 0, 1, 2, \dots,$$

satisfying

$$\int_{-\infty}^{\infty} p_n(W; x) p_m(W; x) W(x) dx = \begin{cases} 1, & m = n, \\ 0, & m \neq n. \end{cases}$$

We let $X_n(W) = \max\{|x_{j_n}(W)| : j = 1, 2, \dots, n\}$, $n = 1, 2, \dots$. Further, for each positive t , ζ_t denotes the smallest possible number (if it exists) such that

$$(2.1) \quad (\zeta_t)^t W(\zeta_t) = \max\{x^t W(x) : x \in (0, \infty)\},$$

and assuming that

$$(2.2) \quad \int_0^\pi |\log W(\zeta \cos \theta)| d\theta < \infty, \quad \zeta \in (0, \infty),$$

we define

$$G_\zeta(W) = \exp\left\{\pi^{-1} \int_0^\pi \log W(\zeta \cos \theta) d\theta\right\}, \quad \zeta \in (0, \infty).$$

3. The Largest Zero.

LEMMA 3.1. *Let $W(x)$ be given by (1.1). Then*

$$\lim_{n \rightarrow \infty} \mu_{2n}(W) / \left[d(2n + b + 1)^{(2-c)/(2(c-1))} \exp\{f(2n + b + 1)^{c/(c-1)}\} \right] = 1,$$

where $d = 2\{2\pi(c - 1)^{-1}(kc)^{1/(1-c)}\}^{1/2}$ and $f = (c - 1)(c^c k)^{1/(1-c)}$.

Proof.

$$(3.1) \quad \begin{aligned} \mu_{2n}(W) &= 2 \int_1^\infty x^{2n+b} \exp(-k(\log x)^c) dx + O(n^{-1}) \\ &= 2(ck^{1/c})^{-1} \int_0^\infty \exp(-v + v^{1/c} X) v^{1/c-1} dv + O(n^{-1}), \end{aligned}$$

where $X = (2n + b + 1)k^{-1/c}$ and $x = \exp((v/k)^{1/c})$. Now apply the asymptotic formula for the integral in (3.1), given in Olver [6, p. 84, Ex. 7.3]. \square

Following is our main result.

THEOREM 3.2. *Let $W(x)$ be given by (1.1). Then*

- (i)
$$\lim_{n \rightarrow \infty} \left(\frac{kc}{2n}\right)^{1/(c-1)} \log X_n(W) = 1.$$
- (ii)
$$\lim_{n \rightarrow \infty} \left(\frac{kc}{2n}\right)^{1/(c-1)} \log\{\gamma_{n-1}(W)/\gamma_n(W)\} = 1.$$

Proof. (i) By Lemma 3 in Freud [3, p. 95],

$$(3.2) \quad \begin{aligned} \log X_n(W) &\geq (\log \mu_{2n-2}(W) - \log \mu_{2n-4}(W))/2 \\ &= (f/2)\{(2n + b - 1)^{c/(c-1)} - (2n + b - 3)^{c/(c-1)}\} + O(n^{-1}) \\ &\quad \text{(by Lemma 3.1)} \\ &= (f/2)(2n)^{c/(c-1)}\{c(c - 1)^{-1}n^{-1} + O(n^{-2})\} + O(n^{-1}) \\ &= (2n/kc)^{1/(c-1)} + O(n^{(2-c)/(c-1)}). \end{aligned}$$

Next, for any $\zeta > 0$ and $A > 1$, Theorem 2 in Freud [4, p. 52] shows that

$$(3.3) \quad X_n(W) \leq A\zeta + \frac{4}{3\pi} \left(\frac{2}{\zeta}\right)^{2n-1} G_\zeta^{-1}(W) \int_{A\zeta}^\infty x^{2n-1} W(x) dx.$$

Freud states this under the additional assumption that $W(x)$ is positive in $(-\infty, \infty)$, but his proof is valid if (2.2) holds. It is easily seen that for some positive constant K_0 , independent of ζ ,

$$(3.4) \quad G_\zeta(W) \geq K_0^{-1}W(\zeta), \quad \zeta \in (0, \infty).$$

Then taking $\zeta = \zeta_{2(n+s)}$ and $A = 2^{n/s}$ where $s \in (0, \infty)$, we obtain, from (2.1), (3.3) and (3.4),

$$(3.5) \quad \begin{aligned} X_n(W) &\leq A\zeta_{2(n+s)} + \frac{4K_0}{3\pi} \left(\frac{2}{\zeta_{2(n+s)}} \right)^{2n-1} \zeta_{2(n+s)}^2 \int_{A\zeta_{2(n+s)}}^\infty x^{-1-2s} dx \\ &= \zeta_{2(n+s)} [2^{n/s} + K_0(3\pi s)^{-1}]. \end{aligned}$$

Next, for large $t \in (0, \infty)$, ζ_t is a root of $d[x^tW(x)]/dx = 0$ so $\log \zeta_t = [(t+b)/kc]^{1/(c-1)}$. Taking $s = n^\delta$ in (3.5) where

$$(3.6) \quad 0 < \delta < 1 \quad \text{and} \quad 1 - \delta(c-1)^{-1},$$

we obtain

$$(3.7) \quad \log X_n(W) \leq [(2n + 2n^\delta + b)/kc]^{1/(c-1)} + n^{1-\delta} \log 2 + o(1).$$

The result follows from (3.2), (3.6) and (3.7).

(ii) follows from (i) and Theorem 1 in Freud [3, p. 91]. \square

Since

$$\{X_n(W)\}^m \leq \sum_{j=1}^n |x_{jn}(W)|^m \leq n \{X_n(W)\}^m, \quad m > 0, n = 1, 2, \dots,$$

we deduce that, for $m > 0$,

$$\lim_{n \rightarrow \infty} \left(\frac{kc}{2n} \right)^{1/(c-1)} \log \left\{ \sum_{j=1}^n |x_{jn}(W)|^m \right\} = m,$$

which provides a contrast to the results of Nevai and Dehesa [5, Theorem 1].

COROLLARY 3.3. *Let $W(x)$ be given by (1.2). Then the conclusions (i), (ii) of Theorem 3.2 remain true.*

Proof. Let

$$W^*(x) = |x| W(x^2) = |x|^{2b+1} \exp(-k_1 |\log |x||^c), \quad x \in (-\infty, \infty),$$

where $k_1 = k2^c$. Then, by Theorem 3.2,

$$(3.8) \quad \begin{aligned} \lim_{n \rightarrow \infty} \left(\frac{k_1 c}{4n} \right)^{1/(c-1)} \log X_{2n}(W^*) &= 1, \\ \lim_{n \rightarrow \infty} \left(\frac{k_1 c}{4n} \right)^{1/(c-1)} \log \{ \gamma_{2n-j-1}(W^*) / \gamma_{2n-j}(W^*) \} &= 1, \quad j = 0, 1. \end{aligned}$$

Further, the substitution $x = u^2$ yields $p_n(W; u^2) = p_{2n}(W^*; u)$ and hence

$$(3.9) \quad X_n(W) = \{X_{2n}(W^*)\}^2; \quad \gamma_n(W) = \gamma_{2n}(W^*),$$

and the conclusions follow from (3.8) and (3.9). \square

For real b , and fixed positive k , let

$$W_b(x) = \begin{cases} k\pi^{-1/2}x^b \exp(-k^2(\log x)^2), & x \in (0, \infty), \\ 0, & x \in (-\infty, 0]. \end{cases}$$

Wigert [7] explicitly found $p_n(W_0; x)$, $n = 1, 2, \dots$, while Chihara [2] constructed discrete solutions of the moment problem corresponding to W_0 , which provided some information regarding the distribution of $\{x_{nj}(W_0)\}_{n,j}$. Using the relation

$$W_b(x) = \alpha^{b^2} W_0(x/\alpha^{2b}), \quad x \in (-\infty, \infty),$$

where $\alpha = \exp(1/4k^2)$, it follows that

$$p_n(W_b; x) = \alpha^{-b(b+2)/2} p_n(W_0; x/\alpha^{2b}), \quad n = 1, 2, \dots,$$

and hence the results of Wigert [7] and Chihara [2] for $W_0(x)$ generalize to $W_b(x)$, any $b \in (-\infty, \infty)$.
