# Some Inequalities for Elementary Mean Values 

By Burnett Meyer

#### Abstract

Upper and lower bounds for the difference between the arithmetic and harmonic means of $n$ positive numbers are obtained in terms of $n$ and the largest and smallest of the numbers. Also, results of S. H. Tung [2], are used to obtain upper and lower bounds for the elementary mean values $M_{p}$ of Hardy, Littlewood, and Pólya.

1. In 1975, S. H. Tung proved the following theorem [2]:

Let $0<b=x_{1} \leqslant x_{2} \leqslant \cdots \leqslant x_{n}=B$. Let $A$ and $G$ be the arithmetic and geometric means, respectively, of $x_{1}, \ldots, x_{n}$. Then

$$
n^{-1}\left(B^{1 / 2}-b^{1 / 2}\right)^{2} \leqslant A-G \leqslant g(b, B),
$$

where $g(b, B)=c b+(1-c) B-b^{c} B^{1-c}$, and

$$
c=\frac{\log [(b / B-b) \log B / b]}{\log B / b} .
$$

We will derive somewhat similar bounds for the difference between the arithmetic and the harmonic means of $n$ positive numbers.
2. In [1, Chapter 2] Hardy, Littlewood, and Pólya discusséd the elementary mean values, which are defined as follows:

Let $x_{1}, x_{2}, \ldots, x_{n}$ be positive numbers, and let $p$ be a real number. Then $M_{p}\left(x_{1}, \ldots, x_{n}\right)$ is defined as $\left[n^{-1} \sum_{k=1}^{n} x_{k}^{p}\right]^{1 / p}$, if $p \neq 0 ; M_{0}\left(x_{1}, \ldots, x_{n}\right)$ is defined as ( $\left.\prod_{k=1}^{n} x_{k}\right)^{1 / n}$. We denote $M_{1}$, the arithmetic mean, by $A ; M_{0}$, the geometric mean, by $G$; and $M_{-1}$, the harmonic mean, by $H$. Since $M_{p}\left(k x_{1}, \ldots, k x_{n}\right)=k M_{p}\left(x_{1}, \ldots, x_{n}\right)$ for all $p$ and for all $k>0$, we may, without loss of generality, assume $x_{1}=1$.

Theorem 1. Let $1=x_{1} \leqslant x_{2} \leqslant \cdots \leqslant x_{n}=B$. Then

$$
\frac{(B-1)^{2}}{n(B+1)} \leqslant A(1, \ldots, B)-H(1, \ldots, B) \leqslant\left(B^{1 / 2}-1\right)^{2} .
$$

Proof. For each $k, 2 \leqslant k \leqslant n$, let

$$
A_{k}=A\left(x_{1}, x_{2}, \ldots, x_{k-1}, x_{n}\right) \quad \text { and } \quad H_{k}=H\left(x_{1}, x_{2}, \ldots, x_{k-1}, x_{n}\right) .
$$

Fix $x_{1}, x_{2}, \ldots, x_{n-2}, x_{n}$, and let $x_{n-1}=x$ vary in $[1, B]$. Let

$$
D(x)=A_{n}-H_{n}=\frac{(n-1) A_{n-1}+x}{n}-\frac{n x H_{n-1}}{(n-1) x+H_{n-1}} .
$$

Computation of $D^{\prime}(x)$ shows that $x=H_{n-1}$ is its only positive zero, and standard methods of analysis show that a minimum for $D(x)$ is attained at $x=H_{n-1}$.

[^0]Therefore,

$$
\left.A_{n}-H_{n} \geqslant D\left(\begin{array}{ll}
H_{n} & 1
\end{array}\right)=n^{-1}(n-1)\left(\begin{array}{lll}
n & 1
\end{array}\right) H_{n} \quad 1\right) .
$$

This process may be repeated, giving

$$
\begin{aligned}
A_{n}-H_{n} & \geqslant \frac{n-1}{n}\left(A_{n 1}-H_{n} 1\right) \geqslant \frac{n-2}{n}\left(A_{n 2}-H_{n} 2\right) \\
& \geqslant \cdots \geqslant \frac{2}{n}\left(A_{2}-H_{2}\right)=\frac{(B-1)^{2}}{n(B+1)} .
\end{aligned}
$$

The maximum of $D(x)$ must occur at an endpoint, 1 or $B$, as each of the variables $x_{2}, x_{3}, \ldots, x_{n}$, in turn varies from 1 to $B$. So

$$
A_{n}-H_{n} \leqslant \frac{n B-(B-1) k}{n}-\frac{n B}{(B-1) k+n}=F(k) .
$$

for some $k, 0 \leqslant k \leqslant n$. The maximum of $F(x)$ on $[0, n]$ will, then, be an upper bound for $A_{n}-H_{n}$. Again, computation of $F^{\prime}(x)$ and standard methods of analysis show that a maximum is attained for $x=n\left(B^{1 / 2}-1\right) /(B-1)$. Hence

$$
A_{n}-H_{n} \leqslant F\left\{n\left(B^{1 / 2}-1\right) /(B-1)\right\}=\left(B^{1 / 2}-1\right)^{2}
$$

This completes the proof of Theorem 1 .
Upper and lower bounds for $G_{n}-H_{n}$ may be obtained using Theorem 1 and Tung's Theorem. since

$$
G_{n}-H_{n}=\left(A_{n}-H_{n}\right)-\left(A_{n}-G_{n}\right) .
$$

3. Tung's Theorem may be used to obtain upper and lower bounds for the elementary mean values $M_{p}$, by using the relation

$$
M_{p}\left(x_{1}, \ldots, x_{n}\right)=\left\{A\left(x_{1}^{p} \ldots, x_{n}^{p}\right)\right\}^{1 / p}
$$

(See [1].)
Theorem 2. Let $1=x_{1} \leqslant x_{2} \leqslant \cdots \leqslant x_{n}=B$, and let $p>0$. Then

$$
\left[n^{-1}\left(B^{p / 2}-1\right)^{2}+G^{p}\right]^{1 / p} \leqslant M_{p}(1 \ldots, B) \leqslant\left[g\left(1, B^{p}\right)+G^{p}\right]^{1 / p}
$$

where $G=G(1, \ldots, B)$, and $g$ is the function defined in Tung's Theorem.
Theorem 3. Let $1=x_{1} \leqslant x_{2} \leqslant \cdots x_{n}=B$, and let $p<0$. Then

$$
\left[g\left(B^{p}, 1\right)+G^{p}\right]^{1 / p} \leqslant M_{p}(1 \ldots, B) \leqslant\left[n^{-1}\left(1-B^{p / 2}\right)^{2}+G^{p}\right]^{1 / p}
$$

where $G=G(1, \ldots, B)$ and $g$ is the function of Tung's Theorem.
