

ON THE NUMBER OF ZEROS OF DIAGONAL FORMS

TSUNEO ISHIKAWA

ABSTRACT. In this paper, we study the number of zeros of the equation $X_1^e + X_2^e + \cdots + X_n^e \equiv 0 \pmod{p}$, where $e > 1$ is a positive integer and $p \equiv 1 \pmod{e}$ is a prime. For $e = 5, 7$, we compute the recurrence satisfied by these numbers, using the generalized Jacobi sums.

1. INTRODUCTION

Let $e > 1$ be a positive integer and let p be a prime, $p \equiv 1 \pmod{e}$. We consider the number of solutions of the equation

$$X_1^e + X_2^e + \cdots + X_n^e = 0$$

in the finite field \mathbb{F}_p . Let $T_e(n)$ denote the number of such solutions. In the case of $e = 3$, Chowla, Cowles, and Cowles proved in [3], using Gauss sums, that for $p \equiv 1 \pmod{3}$

$$\sum_{n=1}^{\infty} T_3(n)x^n = \frac{x}{1-px} + \frac{x^2(p-1)(2+dx)}{1-3px^2-pdx^3},$$

where d is uniquely determined by

$$4p = d^2 + 27b^2 \quad \text{and} \quad d \equiv 1 \pmod{3}.$$

Myerson settled the case of $e = 4$ in the same manner in [11]. It is easy to do the cases $e = 3, 4$ and 6 , because the associated Gauss sum relates to the imaginary quadratic field. In [12], Richman gives a formula for the generating function in terms of the period polynomial of the Gauss sums, but it is difficult to find a formula for this polynomial.

In this paper, we shall consider an algorithm to obtain the recurrence for $T_e(n)$, using generalized Jacobi sums and certain quadratic partitions of p in some cases. But we cannot express the recurrence in general form, because the partition is very intricate except when $e = 3, 4, 6$ and 8 . For $e = 5$ and 7 , if $p < 1000$, we give the recurrence explicitly in Tables 2 and 5, and they may suggest some interesting conjectures. Our method can be applied in the case that the usual Jacobi sums or the cyclotomic numbers of order e are known explicitly,

that is, $e = 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 14, 15, 16, 18, 20, 24$ and 30 (see [1, 2, 4, 6–10, 13, 14]).

2. RECURRENCE

In this section, we show how to obtain the recurrence for $T_e(n)$, using generalized Jacobi sums. The fact that the $T_e(n)$ satisfy a recurrence was already proved by Chowla et al. in [3] and Richman in [12].

Now, since

$$\sum_{t=0}^{p-1} \zeta_p^{ta} = \begin{cases} p & \text{if } a \equiv 0 \pmod{p}, \\ 0 & \text{otherwise,} \end{cases}$$

where $\zeta_p = \exp(\frac{2\pi i}{p})$, we have

$$pT_e(n) = \sum_{t=0}^{p-1} \sum_{x_1=0}^{p-1} \sum_{x_2=0}^{p-1} \cdots \sum_{x_n=0}^{p-1} \zeta_p^{t(x_1^e + x_2^e + \cdots + x_n^e)} = \sum_{t=0}^{p-1} \left(\sum_{x_1=0}^{p-1} \zeta_p^{tx^e} \right)^n = \sum_{t=0}^{p-1} G(t)^n,$$

where $G(t)$ is the Gauss sum of order e :

$$G(t) = \sum_{x_1=0}^{p-1} \zeta_p^{tx^e}.$$

We take Δ in \mathbb{F}_p such that Δ^d is not an e th power for any d ($0 < d < e$). Then, the multiplicative group \mathbb{F}_p^* of \mathbb{F}_p has the following coset decomposition:

$$\mathbb{F}_p^* = (\mathbb{F}_p^*)^e + \Delta(\mathbb{F}_p^*)^e + \Delta^2(\mathbb{F}_p^*)^e + \cdots + \Delta^{e-1}(\mathbb{F}_p^*)^e.$$

Notice that each coset has $\frac{p-1}{e}$ elements and that $G(u) = G(v)$ for any $u, v \in \Delta^j(\mathbb{F}_p^*)^e$ ($j = 0, 1, \dots, e-1$). Since $G(0) = p$, we have

$$(1) \quad pT_e(n) = \frac{p-1}{e} \sum_{j=0}^{e-1} G(\Delta^j)^n + p^n.$$

Thus, $G(\Delta^j)$ ($j = 0, 1, \dots, e-1$) are roots of the polynomial

$$(2) \quad F_e(x) = x^e + y_1 x^{e-1} + y_2 x^{e-2} + \cdots + y_e,$$

where $y_i = -\frac{1}{i} \sum_{j=0}^{i-1} y_j s_{i-j}$ with $y_0 = 1$ and $s_i = \sum_{j=0}^{e-1} G(\Delta^j)^i$. Since $s_i \equiv 0 \pmod{p}$ for any $i \geq 1$, we have

$$(3) \quad y_i \equiv 0 \pmod{p} \quad \text{for } 1 \leq i \leq e.$$

From (2), we see that the numbers $T_e(n)$ satisfy the recurrence

$$(pT_e(n+e) - p^{n+e}) + y_1(pT_e(n+e-1) - p^{n+e-1}) + \cdots + y_e(pT_e(n) - p^n) = 0,$$

that is,

$$(4) \quad T_e(n+e) + y_1 T_e(n+e-1) + \cdots + y_e T_e(n) - p^{n-1} F_e(p) = 0.$$

Therefore, we have only to find $T_e(1), T_e(2), \dots, T_e(e)$. It is easy to check that

$$T_e(1) = 1, \quad T_e(2) = \begin{cases} 1 + e(p-1) & \text{if } -1 \text{ is an } e\text{th power in } \mathbb{F}_p, \\ 1 & \text{otherwise} \end{cases}$$

and

$$y_1 = 0, \quad y_2 = \begin{cases} -pe(e-1)/2 & \text{if } -1 \text{ is an } e\text{th power in } \mathbb{F}_p, \\ pe/2 & \text{otherwise.} \end{cases}$$

Next, we will represent $T_e(n)$, using the multiplicative character on \mathbb{F}_p^* . From now on, we denote a multiplicative character by χ . We call the character χ_0 defined by $\chi_0(a) = 1$ for all $a \in \mathbb{F}_p^*$ the trivial character. It is useful to extend the domain of definition of a multiplicative character to all of \mathbb{F}_p . If $\chi \neq \chi_0$ we do this by defining $\chi(0) = 0$. For χ_0 , we define $\chi_0(a) = 1$ for all $a \in \mathbb{F}_p$.

Since

$$(5) \quad \#\{x \in \mathbb{F}_p | x^e = a\} = \sum_{\chi^e=1} \chi(a) = \begin{cases} e & \text{if } a \text{ is an } e\text{th power in } \mathbb{F}_p, \\ 1 & \text{if } a = 0, \\ 0 & \text{otherwise,} \end{cases}$$

we have

$$T_e(n) = \sum_{\chi_1^e=1} \sum_{\chi_2^e=1} \cdots \sum_{\chi_n^e=1} \sum_{a_1+\cdots+a_n=0} \chi_1(a_1) \chi_2(a_2) \cdots \chi_n(a_n)$$

with $a_1, \dots, a_n \in \mathbb{F}_p$. If $a_n = 0$, then $\chi_n = \chi_0$, and the sum is $T_e(n-1)$. If $a_n \neq 0$, then the sum equals

$$\begin{aligned} & \sum_{a_n=1}^{p-1} \sum_{\chi_1} \cdots \sum_{\chi_n} \chi_1 \cdots \chi_{n-1}(-1) \chi_1 \cdots \chi_n(a_n) \sum_{a_1+\cdots+a_{n-1}=1} \chi_1(a_1) \cdots \chi_{n-1}(a_{n-1}) \\ &= (p-1) \sum_{\chi_1} \cdots \sum_{\chi_{n-1}} \chi_1 \cdots \chi_{n-1}(-1) \sum_{a_1+\cdots+a_{n-1}=1} \chi_1(a_1) \cdots \chi_{n-1}(a_{n-1}). \end{aligned}$$

Let $S_e(n)$ denote

$$\sum_{\chi_1} \cdots \sum_{\chi_n} \chi_1 \cdots \chi_n(-1) J_e(\chi_1, \dots, \chi_n),$$

where

$$(6) \quad J_e(\chi_1, \dots, \chi_n) = \sum_{a_1+\cdots+a_n=1} \chi_1(a_1) \cdots \chi_n(a_n)$$

is the generalized Jacobi sum. Hence, we have

$$(7) \quad T_e(n) = T_e(n-1) + (p-1) S_e(n-1),$$

and we need to calculate sums of Jacobi sums $S_e(2), \dots, S_e(e-1)$.

Remark. Since $G(\Delta) = \sum_a \#\{x \in \mathbb{F}_p | x^e = a\} \zeta_p^{\Delta a}$, from (5) we have $G(\Delta) \equiv 1 \pmod{e}$ in $\mathbb{Z}[\zeta_p]$, for $\Delta \not\equiv 0 \pmod{p}$. Then $e^e | F_e(p)$.

3. PROPERTIES OF GENERALIZED JACOBI SUMS

In this section, we will study the properties of generalized Jacobi sums. We can calculate them from usual Jacobi sums $J_e(\chi_1, \chi_2)$ by the following proposition.

Proposition. *The generalized Jacobi sum $J_e(\chi_1, \dots, \chi_n)$ satisfies the following properties (a)–(e):*

- (a) $J_e(\chi_1, \dots, \chi_i, \dots, \chi_j, \dots, \chi_n) = J_e(\chi_1, \dots, \chi_j, \dots, \chi_i, \dots, \chi_n)$.
- (b) *If all of the χ_i ($1 \leq i \leq n$) are trivial, then*

$$J_e(\chi_1, \dots, \chi_n) = p^{n-1}.$$

- (c) *If some but not all of the χ_i are trivial, then*

$$J_e(\chi_1, \dots, \chi_n) = 0.$$

- (d) *If χ_1, \dots, χ_n and $\chi_1\chi_2$ are nontrivial for $n \geq 3$, then*

$$J_e(\chi_1, \chi_2, \chi_3, \dots, \chi_n) = J_e(\chi_1, \chi_2) J_e(\chi_1\chi_2, \chi_3, \dots, \chi_n).$$

- (e) *If χ_1, \dots, χ_n are nontrivial and $\chi_1\chi_2$ is trivial, then*

$$J_e(\chi_1, \chi_2, \chi_3, \dots, \chi_n) = p J_e(\chi_3, \dots, \chi_n)$$

for $n \geq 4$, and $J_e(\chi_1, \chi_2, \chi_3) = p$.

Proof. See [5, pp. 98–101].

4. THE CASE $e = 5$

For p a prime $\equiv 1 \pmod{5}$, we consider the pair of diophantine equations

$$(8) \quad 16p = a_1^2 + 50a_2^2 + 50a_3^2 + 125a_4^2,$$

$$(9) \quad a_1a_4 = a_3^2 - 4a_2a_3 - a_2^2, \quad a_1 \equiv 1 \pmod{5}.$$

Dickson proved in [4] that this simultaneous system has exactly four solutions, and if one of these is (a_1, a_2, a_3, a_4) , the other three are

$$(a_1, -a_2, -a_3, a_4), \quad (a_1, a_3, -a_2, -a_4) \quad \text{and} \quad (a_1, -a_3, a_2, -a_4).$$

On the other hand, we can choose a prime factor π of p in the unique factorization domain $\mathbb{Z}[\zeta_5]$ and a character χ of order 5 associated with π , such that

$$J_5(\chi, \chi) = -\pi_1\pi_4,$$

where $\pi_i = \sigma_i(\pi)$ and σ_i is the automorphism of $\mathbb{Q}(\zeta_5)$ defined by $\sigma_i(\zeta_5) = \zeta_5^i$ ($1 \leq i \leq 4$), and $\zeta_5 = \exp(\frac{2\pi i}{5})$. If

$$J_5(\chi, \chi) = c_1\zeta_5 + c_2\zeta_5^2 + c_3\zeta_5^3 + c_4\zeta_5^4,$$

then the four solutions of (8) and (9) correspond to $\sigma_i(J_5(\chi, \chi)) = J_5(\chi^i, \chi^i)$ ($1 \leq i \leq 4$) by

$$\begin{aligned} 4c_1 &= -a_1 + 2a_2 + 4a_3 + 5a_4, & 4c_2 &= -a_1 + 4a_2 - 2a_3 - 5a_4, \\ 4c_3 &= -a_1 - 4a_2 + 2a_3 - 5a_4, & 4c_4 &= -a_1 - 2a_2 - 4a_3 + 5a_4. \end{aligned}$$

This result was proved by Dickson in [4].

From properties of Jacobi sums (see [5, 9]):

$$\begin{aligned} (10) \quad J_e(\chi^i, \chi^j) &= J_e(\chi^j, \chi^i) \\ &= (-1)^{(p-1)j/e} J_e(\chi^{-i-j}, \chi^j) \quad (i, j, i+j \not\equiv 0 \pmod{p}), \end{aligned}$$

$$(11) \quad J_e(\chi^i, \chi^{-i}) = -\chi(-1) = -1 \quad (i \not\equiv 0 \pmod{p}),$$

we have

$$\begin{aligned} J_5(\chi, \chi^3) &= J_5(\chi, \chi), & J_5(\chi^4, \chi^4) &= J_5(\chi^2, \chi^4) = \sigma_4(J_5(\chi, \chi)), \\ J_5(\chi^3, \chi^3) &= J_5(\chi^3, \chi^4) = \sigma_3(J_5(\chi, \chi)), \\ J_5(\chi^2, \chi^2) &= J_5(\chi, \chi^2) = \sigma_2(J_5(\chi, \chi)), \end{aligned}$$

and

$$J_5(\chi, \chi^4) = J_5(\chi^2, \chi^3) = -1.$$

Hence, we obtain the following results by direct calculation from the proposition.

Theorem 1. *If (a_1, a_2, a_3, a_4) is any solution of (8) and (9), then*

$$S_5(2) = p - 4 + 3a_1,$$

$$S_5(3) = p^2 + 36p + a_1^2 - 3a_1 - 125a_4^2,$$

and

$$\begin{aligned} S_5(4) &= \frac{1}{8} \{ a_1^3 - 8a_1^2 - 625a_1a_4^2 + 392a_1p - 2500a_2a_3a_4 \\ &\quad + 1000a_4^2 + 8p^3 - 288p \}. \end{aligned}$$

From (1), (2), (3), (4) and (7), we can determine the recurrence for $T_5(n)$. It is given by

$$\begin{aligned} T_5(n+5) - 10pT_5(n+3) + pY_3T_5(n+2) + pY_4T_5(n+1) \\ + pY_5T_5(n) - 5^5Zp^n = 0, \quad n \geq 1, \end{aligned}$$

where

$$Y_3 = y_3/p = -5a_1, \quad Y_4 = y_4/p = -(a_1^2 - 125a_4^2 - 4p)/4,$$

$$Y_5 = y_5/p = -(a_1^3 - 625a_1a_4^2 - 8a_1p - 2500a_2a_3a_4)/8 \quad \text{and} \quad Z = F_5(p)/3125p.$$

For example, for $p < 1000$, the values of $a_1, a_2, a_3, a_4, Y_3, Y_4, Y_5, Z$ and the first few values are given in Table 1, Table 2 and Table 3.

5. THE CASE $e = 7$

Similarly, for p a prime $\equiv 1 \pmod{7}$, we consider the triple of diophantine equations

$$(12) \quad 72p = 2a_1^2 + 42(a_2^2 + a_3^2 + a_4^2) + 343(a_5^2 + 3a_6^2),$$

$$(13) \quad 12(a_2^2 - a_4^2 + 2a_2a_3 - 2a_2a_4 + 4a_3a_4) \\ + 49(3a_5^2 + 2a_5a_6 - 9a_6^2) + 56a_1a_6 = 0,$$

$$(14) \quad 12(a_2^2 - a_4^2 + 4a_2a_3 + 2a_2a_4 + 2a_3a_4) \\ + 49(a_5^2 + 10a_5a_6 - 3a_6^2) + 28a_1(a_5 + a_6) = 0,$$

$$(15) \quad a_1 \equiv 1 \pmod{7}.$$

This simultaneous system has six nontrivial solutions in addition to the two trivial solutions $(-6b_1, \pm 2b_2, \pm 2b_2, \mp 2b_2, 0, 0)$, where b_1 and b_2 are given by

$$(16) \quad p = b_1^2 + 7b_2^2, \quad b_1 \equiv -1 \pmod{7}.$$

If $(a_1, a_2, a_3, a_4, a_5, a_6)$ is one of the six nontrivial solutions of (12)–(15), the other five nontrivial solutions are

$$\begin{aligned} & (a_1, -a_3, a_4, a_2, -(a_5 + 3a_6)/2, (a_5 - a_6)/2), \\ & (a_1, -a_4, a_2, -a_3, -(a_5 - 3a_6)/2, -(a_5 + a_6)/2), \\ & (a_1, -a_2, -a_3, -a_4, a_5, a_6), \\ & (a_1, a_3, -a_4, -a_2, -(a_5 + 3a_6)/2, (a_5 - a_6)/2), \\ & (a_1, a_4, -a_2, a_3, -(a_5 - 3a_6)/2, -(a_5 + a_6)/2). \end{aligned}$$

For some character χ of order 7, these solutions correspond to Jacobi sums

$$J_7(\chi^i, \chi^i) = \sigma_i(J_7(\chi, \chi)) \quad (1 \leq i \leq 6),$$

with

$$(17) \quad J_7(\chi, \chi) = c_1\zeta_7 + c_2\zeta_7^2 + c_3\zeta_7^3 + c_4\zeta_7^4 + c_5\zeta_7^5 + c_6\zeta_7^6,$$

where

$$(18) \quad \begin{aligned} 12c_1 &= -2a_1 + 6a_2 + 7a_5 + 21a_6, & 12c_2 &= -2a_1 + 6a_3 + 7a_5 - 21a_6, \\ 12c_3 &= -2a_1 + 6a_4 - 14a_5, & 12c_4 &= -2a_1 - 6a_4 - 14a_5, \\ 12c_5 &= -2a_1 - 6a_3 + 7a_5 - 21a_6, & 12c_6 &= -2a_1 - 6a_2 + 7a_5 + 21a_6, \end{aligned}$$

and σ_i is the automorphism of $\mathbb{Q}(\zeta_7)$ defined by $\sigma_i(\zeta_7) = \zeta_7^i$ ($1 \leq i \leq 6$). The trivial solutions correspond to Jacobi sums $\sigma_i(J_7(\chi, \chi^2))$ ($i = 1, 6$) with

$$J_7(\chi, \chi^2) = b_1 + b_2\sqrt{-7}.$$

These results were proved by Leonard and Williams in [6]. Since

$$\begin{aligned} J_7(\chi, \chi^5) &= J_7(\chi, \chi), \quad J_7(\chi^6, \chi^6) = J_7(\chi^2, \chi^6), \quad J_7(\chi^2, \chi^2) = J_7(\chi^2, \chi^3), \\ J_7(\chi^5, \chi^5) &= J_7(\chi^4, \chi^5), \quad J_7(\chi^3, \chi^3) = J_7(\chi, \chi^3), \\ J_7(\chi^4, \chi^4) &= J_7(\chi^4, \chi^6), \quad J_7(\chi, \chi^4) = J_7(\chi^2, \chi^4) = J_7(\chi, \chi^2), \\ J_7(\chi^3, \chi^5) &= J_7(\chi^3, \chi^6) = J_7(\chi^5, \chi^6) = \sigma_6(J_7(\chi, \chi^2)), \quad \text{and} \\ J_7(\chi, \chi^6) &= J_7(\chi^2, \chi^5) = J_7(\chi^3, \chi^4) = -1, \end{aligned}$$

from (10) and (11) we obtain the following results from the proposition.

Theorem 2. *If $(a_1, a_2, a_3, a_4, a_5, a_6)$ is any nontrivial solution of (12)–(15) with $a_1 \equiv 1 \pmod{7}$ and (b_1, b_2) is the solution of (16) with $b_1 \equiv -1 \pmod{7}$, then*

$$S_7(2) = p - 6 + 3a_1 + 12b_1,$$

$$S_7(3) = p^2 + p - 6 - S_7(2) + 66p + 2a_1^2 + 8a_1b_1 + 14U_1 - 28U_2,$$

$$\begin{aligned}
S_7(4) &= \frac{p^4 - 1}{p - 1} - 7 - S_7(2) - S_7(3) \\
&\quad + \frac{5}{144} \{ 8a_1^3 + 144a_1^2b_1 + 2736a_1p - 168a_1U_2 \\
&\quad \quad + 8640b_1p + 1008b_1U_1 \\
&\quad \quad - 2016b_1U_2 - 4116V_1(0, 1) + 2401V_2(5, -9) \} \\
S_7(5) &= \frac{p^5 - 1}{p - 1} - 7 - S_7(2) - S_7(3) - S_7(4) \\
&\quad + \frac{1}{12} \{ 8a_1^3b_1 + 972a_1^2p + 4896a_1b_1p - 168a_1b_1U_2 + 4320b_1^2p \\
&\quad \quad - 4116b_1V_1(0, 1) + 2401b_1V_2(5, -9) + 9576p^2 \\
&\quad \quad + 5544pU_1 - 9072pU_2 \},
\end{aligned}$$

and

$$\begin{aligned}
S_7(6) &= \frac{p^6 - 1}{p - 1} - 7 - S_7(2) - S_7(3) - S_7(4) - S_7(5) \\
&\quad - \frac{1}{864} \{ 34a_1^4b_1 - 5688a_1^3p - 334368a_1^2b_1p + 1512a_1^2b_1U_1 \\
&\quad \quad + 504a_1^2b_1U_2 - 362880a_1b_1^2p + 24696a_1b_1V_1(0, 1) \\
&\quad \quad - 4802a_1b_1V_2(13, 27) - 2334528a_1p^2 + 77112a_1pU_1 \\
&\quad \quad + 99792a_1pU_2 - 5145120b_1p^2 - 1829520b_1pU_1 \\
&\quad \quad + 2116800b_1pU_2 + 2646b_1U_1^2 - 3087b_1W_1(-2, 15, 27) \\
&\quad \quad - 6174b_1W_2(4, 12, 9) - 10584b_1W_3 + 3630312pV_1(0, 1) \\
&\quad \quad - 24696pV_1(1, 0) - 1210104pV_1(1, -1) \\
&\quad \quad + 14406pV_2(11, -45) - 2117682pV_2(5, -9) \\
&\quad \quad - 1411788pV_2(1, 36) \},
\end{aligned}$$

where

$$\begin{aligned}
U_1 &= a_2^2 + a_3^2 + a_4^2, \quad U_2 = a_2a_3 - a_2a_4 - a_3a_4, \\
V_1(i, j) &= (i - j)a_2a_3a_5 + (2i + j)a_2a_4a_5 - (i + 2j)a_3a_4a_5 \\
&\quad + 3(i + j)a_2a_3a_6 + 3ja_2a_4a_6 + 3ia_3a_4a_6, \\
V_2(i, j) &= ia_5^3 + ja_5^2a_6 - 9ia_5a_6^2 - ja_6^3, \\
W_1(i, j, k) &= (i - j + k)a_2^2a_5^2 + 2(3i - j - k)a_2^2a_5a_6 + (9i + 3j + k)a_2^2a_6^2 \\
&\quad + (i + j + k)a_3^2a_5^2 - 2(3i + j - k)a_3^2a_5a_6 + (9i - 3j + k)a_3^2a_6^2 \\
&\quad + 4ia_4^2a_5^2 + 4ja_4^2a_5a_6 + 4ka_4^2a_6^2, \\
W_2(i, j, k) &= -(i - j + k)a_2a_3a_5^2 - 2(3i - j - k)a_2a_3a_5a_6 \\
&\quad - (9i + 3j + k)a_2a_3a_6^2 + (i + j + k)a_3a_4a_5^2 \\
&\quad - 2(3i + j - k)a_3a_4a_5a_6 + (9i - 3j + k)a_3a_4a_6^2 \\
&\quad + 4ia_2a_4a_5^2 + 4ja_2a_4a_5a_6 + 4ka_2a_4a_6^2, \\
W_3 &= a_2^3a_3 - a_3^3a_4 - a_4^3a_2.
\end{aligned}$$

Note, that U_1, \dots, W_3 are invariants under the change of the solution of (12)–(15).

It is hard to check the results of this theorem, but we calculated them as follows. Let $\mathcal{G}_i = \sigma_i(J_7(\chi, \chi))$ ($1 \leq i \leq 6$) and $\mathcal{H}_i = \sigma_i(J_7(\chi, \chi^2))$ ($i = 1, 6$). First, we expressed $S_7(2), \dots, S_7(6)$ in terms of 10 polynomials:

$$\begin{aligned} & \mathcal{G}_1 + \mathcal{G}_2 + \mathcal{G}_3 + \mathcal{G}_4 + \mathcal{G}_5 + \mathcal{G}_6, \\ & \mathcal{G}_1^2 + \mathcal{G}_2^2 + \mathcal{G}_3^2 + \mathcal{G}_4^2 + \mathcal{G}_5^2 + \mathcal{G}_6^2, \\ & \mathcal{H}_1 + \mathcal{H}_2, \quad \mathcal{H}_1^2 + \mathcal{H}_2^2, \\ & \mathcal{G}_1\mathcal{G}_2 + \mathcal{G}_2\mathcal{G}_4 + \mathcal{G}_4\mathcal{G}_1 + \mathcal{G}_3\mathcal{G}_5 + \mathcal{G}_5\mathcal{G}_6 + \mathcal{G}_6\mathcal{G}_3, \\ & \mathcal{G}_1\mathcal{G}_3 + \mathcal{G}_1\mathcal{G}_5 + \mathcal{G}_2\mathcal{G}_3 + \mathcal{G}_2\mathcal{G}_6 + \mathcal{G}_4\mathcal{G}_5 + \mathcal{G}_4\mathcal{G}_6, \\ & \mathcal{G}_1^2\mathcal{G}_2 + \mathcal{G}_2^2\mathcal{G}_4 + \mathcal{G}_4^2\mathcal{G}_1 + \mathcal{G}_3\mathcal{G}_5^2 + \mathcal{G}_5\mathcal{G}_6^2 + \mathcal{G}_6\mathcal{G}_3^2, \\ & \mathcal{G}_1^2\mathcal{G}_3 + \mathcal{G}_1\mathcal{G}_5^2 + \mathcal{G}_2^2\mathcal{G}_3 + \mathcal{G}_2\mathcal{G}_6^2 + \mathcal{G}_4^2\mathcal{G}_5 + \mathcal{G}_4\mathcal{G}_6^2, \\ & \mathcal{G}_1^2\mathcal{H}_2 + \mathcal{G}_2^2\mathcal{H}_2 + \mathcal{G}_3^2\mathcal{H}_1 + \mathcal{G}_4^2\mathcal{H}_2 + \mathcal{G}_5^2\mathcal{H}_1 + \mathcal{G}_6^2\mathcal{H}_1, \\ & \mathcal{G}_1^3\mathcal{G}_2 + \mathcal{G}_2^3\mathcal{G}_4 + \mathcal{G}_4^3\mathcal{G}_1 + \mathcal{G}_3\mathcal{G}_5^3 + \mathcal{G}_5\mathcal{G}_6^3 + \mathcal{G}_6\mathcal{G}_3^3. \end{aligned}$$

Next, substituting (17) and (18) for them, they may be expressed as a polynomial in $p, a_1, b_1, U_1, \dots, W_3$.

Notice that b_2 is not needed in Theorem 2, but is determined by

$$J_7(\chi, \chi)J_7(\chi^2, \chi^2)J_7(\chi^4, \chi^4) = p J_7(\chi, \chi^2).$$

The recurrence for $T_7(n)$ is given by

$$\begin{aligned} T_7(n+7) - 21pT_7(n+5) + pY_3T_7(n+4) + pY_4T_7(n+3) + pY_5T_7(n+2) \\ + pY_6T_7(n+1) + pY_7T_7(n) - 7^7Zp^n = 0, \end{aligned}$$

where

$$\begin{aligned} Y_3 &= y_3/p = \frac{7}{3}(p - 6 - S_7(2)), \\ Y_4 &= y_4/p = \frac{7}{4}(p^2 + 127p - 6 - S_7(2) - S_7(3)), \\ Y_5 &= y_5/p = \frac{7}{5}(p^3 - 34p^2 + 35pS_7(2) + 211p - 6 - S_7(2) - S_7(3) - S_7(4)), \\ Y_6 &= y_6/p = \frac{7}{36}(6p^4 - 169p^3 - 28p^2S_7(2) - 8289p^2 + 14pS_7(2)^2 + 357pS_7(2) \\ &\quad + 189pS_7(3) + 1644p - 36) - \frac{7}{6}(S_7(2) + S_7(3) + S_7(4) + S_7(5)), \\ Y_7 &= y_7/p = \frac{1}{60}(60p^5 - 1459p^4 - 245p^3S_7(2) + 27941p^3 \\ &\quad - 31360p^2S_7(2) - 245p^2S_7(3) - 189864p^2 + 245pS_7(2)^2 \\ &\quad + 245pS_7(2)S_7(3) + 4704pS_7(2) + 3234pS_7(3) + 1764pS_7(4) \\ &\quad + 19464p - 360) - (S_7(2) + S_7(3) + S_7(4) + S_7(5) + S_7(6)), \\ Z &= F_7(p)/823543p. \end{aligned}$$

For example, for $p < 1000$, we have Table 4, Table 5 and Table 6.

ACKNOWLEDGMENT

The author is grateful to Professor Y. Mimura and the referee for many suggestions and comments.
