

## Editorial Information

As of December 31, 1999, the backlog for this journal was approximately 3 issues. This estimate is the result of dividing the number of manuscripts for this journal in the Providence office that have not yet gone to the printer on the above date by the average number of articles per issue over the previous twelve months, reduced by the number of issues published in six months (the time necessary for editing and composing a typical issue). In an effort to make articles available as quickly as possible, articles are posted to e-MATH individually soon after proof is returned from authors and before appearing in an issue.

A Consent to Publish and Copyright Agreement is required before a paper will be published in this journal. After a paper is accepted for publication, the Providence office will send out a Consent to Publish and Copyright Agreement to all authors of the paper. By submitting a paper to this journal, authors certify that the results have not been submitted to nor are they under consideration for publication by another journal, conference proceedings, or similar publication.

## Information for Authors

**Initial submission.** An author should submit three paper copies of the manuscript. Initial submission by e-mail is not allowed. The author may suggest an appropriate editor for his paper. All contributions intended for publication and all books for review should be addressed to Lars B. Wahlbin, Managing Editor, Mathematics of Computation, Center for Applied Mathematics, 657 Frank H. T. Rhodes Hall, Cornell University, Ithaca, NY 14853-3801. The date received, which is published with the final version of an accepted paper, is the date received in the office of the Managing Editor, and it is the responsibility of the author to submit manuscripts directly to this office.

The first page must consist of a *descriptive title*, followed by an *abstract* that summarizes the article in language suitable for workers in the general field (algebra, analysis, etc.). The *descriptive title* should be short, but informative; useless or vague phrases such as “some remarks about” or “concerning” should be avoided. The *abstract* must be brief and reasonably self-contained. Included with the footnotes to the paper should be the 2000 *Mathematics Subject Classification* representing the primary and secondary subjects of the article. The classifications are accessible from <http://www.amg.org/msc>. The list of classifications will also be available in print starting with the 1999 annual index of *Mathematical Reviews*. The Mathematics Subject Classification footnote may be followed by a list of *key words and phrases* describing the subject matter of the article and taken from it. Journal abbreviations used in bibliographies are listed in the latest *Mathematical Reviews* annual index. The series abbreviations are also accessible from <http://www.ams.org/publications>. When the manuscript is submitted, authors should supply the editor with electronic addresses if available. These will be printed after the postal address at the end of each article.

**Electronically prepared manuscripts.** For the final submission of accepted papers, the AMS encourages use of electronically prepared manuscripts, with a strong preference for  $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}^{\mathcal{A}}\mathcal{T}\mathcal{E}\mathcal{X}$ . To this end, the Society has prepared  $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}^{\mathcal{A}}\mathcal{T}\mathcal{E}\mathcal{X}$  author packages for each AMS publication. Author packages include instructions for preparing electronic manuscripts, the *AMS Author Handbook*, samples, and a style file that generates the particular design specifications of that publication series. Articles properly prepared using the  $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}^{\mathcal{A}}\mathcal{T}\mathcal{E}\mathcal{X}$  style file automatically provide hypertext linking to the bibliography and other elements of the article for searching electronically on the World Wide Web. Because linking must often be added manually to electronically prepared manuscripts in other forms of  $\mathcal{T}\mathcal{E}\mathcal{X}$ , using  $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}^{\mathcal{A}}\mathcal{T}\mathcal{E}\mathcal{X}$  also reduces the amount of technical intervention once the files are received by the AMS. This results in fewer errors in processing and saves the author proofreading time.  $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}^{\mathcal{A}}\mathcal{T}\mathcal{E}\mathcal{X}$  papers also move more efficiently through the production stream, helping to minimize publishing costs.

$\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}^{\mathcal{A}}\mathcal{T}\mathcal{E}\mathcal{X}$  is the highly preferred format of  $\mathcal{T}\mathcal{E}\mathcal{X}$ , but author packages are also available in  $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{T}\mathcal{E}\mathcal{X}$ . Those authors who make use of these style files from the beginning of the

writing process will further reduce their own efforts. Manuscripts prepared electronically in L<sup>A</sup>T<sub>E</sub>X or plain T<sub>E</sub>X are normally not acceptable due to the high amount of technical time required to insure that the file will run properly through the AMS in-house production system. L<sup>A</sup>T<sub>E</sub>X users will find that  $\mathcal{A}\mathcal{M}\mathcal{S}$ -L<sup>A</sup>T<sub>E</sub>X is the same as L<sup>A</sup>T<sub>E</sub>X with additional commands to simplify the typesetting of mathematics, and users of plain T<sub>E</sub>X should have the foundation for learning  $\mathcal{A}\mathcal{M}\mathcal{S}$ -L<sup>A</sup>T<sub>E</sub>X.

Authors may retrieve an author package from e-MATH via the World Wide Web through the URL <http://www.ams.org/tex/> or via FTP to <ftp.ams.org> (login as `anonymous` and enter username as password). The author package can also be obtained free of charge by sending e-mail to [pub@ams.org](mailto:pub@ams.org) (Internet) or from the Publication Division, American Mathematical Society, P.O. Box 6248, Providence, RI 02940-6248. When requesting an author package, please specify  $\mathcal{A}\mathcal{M}\mathcal{S}$ -L<sup>A</sup>T<sub>E</sub>X or  $\mathcal{A}\mathcal{M}\mathcal{S}$ -T<sub>E</sub>X, Macintosh or IBM (3.5) format, and the publication in which your paper will appear. Please be sure to include your complete mailing address.

The final version of the electronic manuscript should be sent to the Providence office immediately after the paper has been accepted for publication. The author should also send the final version of the paper manuscript to the Managing Editor, who will forward a copy to the Providence office. Editors will require authors to send their electronically prepared manuscripts to the Providence office in a timely fashion. Electronically prepared manuscripts can be sent via e-mail to [pub-submit@ams.org](mailto:pub-submit@ams.org) (Internet) or on diskette to the Electronic Prepress Department, American Mathematical Society, P.O. Box 6248, Providence, RI 02940-6248. When sending a manuscript electronically, please be sure to include a message indicating in which publication the paper has been accepted. No corrections will be accepted electronically. Authors must mark their changes on their proof copies and return them to the Providence office. Complete instructions on how to send files are included in the author package.

**Electronic graphics.** Figures may be sent to the AMS in an electronic format. The AMS recommends that graphics created electronically be saved in Encapsulated PostScript (EPS) format. This includes graphics originated via a graphics application as well as scanned photographs or other computer-generated images.

If the graphics package used does not support EPS output, the graphics file should be saved in one of the standard graphics formats—such as TIFF, PICT, GIF, etc.—rather than in an application-dependent format. Graphics files sent in an application-dependent format are not likely to be used. No matter what method was used to produce the graphic, it is necessary to provide a paper copy to the AMS.

Authors using graphics packages for the creation of electronic art should also avoid the use of any lines thinner than 0.5 points in width. Many graphics packages allow the user to specify a “hairline” for a very thin line. Hairlines often look acceptable when proofed on a typical laser printer. However, when produced on a high-resolution laser imagesetter, hairlines become nearly invisible and will be lost entirely in the final printing process.

Screens should be set to values between 15% and 85%. Screens which fall outside of this range are too light or too dark to print correctly.

**Manuscript Tracking.** Authors can track their manuscripts through the AMS journal production process using the personal AMS ID and Article ID printed in the upper right-hand corner of the Consent to Publish form sent to each author who publishes in AMS journals. Access to the tracking system is available from <http://www.ams.org/mstrack/> or via email sent to [mstrack-query@ams.org](mailto:mstrack-query@ams.org). To access by email, on the subject line of the message simply enter the AMS ID and Article ID. To track more than one manuscript by email, choose one of the Article IDs and enter the AMS ID and the Article ID followed by the word *all* on the subject line. An explanation of each production step is provided on the web through links from the manuscript tracking screen. Questions can be sent to [mcom-query@ams.org](mailto:mcom-query@ams.org).

**T<sub>E</sub>X files available.** Beginning with the January 1992 issue of the *Bulletin* and the January 1996 issues of *Transactions*, *Proceedings*, *Mathematics of Computation*, and the

*Journal of the AMS*,  $\text{\TeX}$  files can be downloaded from e-MATH, starting from URL <http://www.ams.org/journals/>. Authors without Web access may request their files at the address given below after the article has been published. For *Bulletin* papers published in 1987 through 1991 and for *Transactions, Proceedings, Mathematics of Computation*, and the *Journal of the AMS* papers published in 1987 through 1995,  $\text{\TeX}$  files are available upon request for authors without Web access by sending e-mail to [file-request@ams.org](mailto:file-request@ams.org) or by contacting the Electronic Prepress Department, American Mathematical Society, P.O. Box 6248, Providence, RI 02940-6248. The request should include the title of the paper, the name(s) of the author(s), the name of the publication in which the paper has or will appear, and the volume and issue numbers if known. The  $\text{\TeX}$  file will be sent to the author making the request after the article goes to the printer. If the requestor can receive Internet e-mail, please include the e-mail address to which the file should be sent. Otherwise please indicate a diskette format and postal address to which a disk should be mailed. **Note:** Because  $\text{\TeX}$  production at the AMS sometimes requires extra fonts and macros that are not yet publicly available,  $\text{\TeX}$  files cannot be guaranteed to run through the author's version of  $\text{\TeX}$  without errors. The AMS regrets that it cannot provide support to eliminate such errors in the author's  $\text{\TeX}$  environment.

Any inquiries concerning a paper that has been accepted for publication should be sent directly to the Electronic Prepress Department, American Mathematical Society, P.O. Box 6248, Providence, RI 02940-6248.

## Student Mathematical Library

### Recommended Text

### An Introduction to the Mathematical Theory of Waves

Roger Knobel, *University of Texas-Pan American, Edinburg*

This book is based on an undergraduate course taught at the IAS/Park City Mathematics Institute, on linear and nonlinear waves. It is intended to be a text suitable for independent study by undergraduate students in mathematics, engineering, and science. The content of the book is meant to be self-contained, requiring no special reference material.

**Student Mathematical Library**, Volume 3; 2000; 196 pages; Softcover; ISBN 0-8218-2039-7; List \$23; All AMS members \$18; Order code STML/3

### Recommended Text

### Lectures on Contemporary Probability

Gregory F. Lawler, *Duke University, Durham, NC*, and Lester N. Coyle, *Loyola College, Baltimore, MD*

This volume is based on classes in probability for advanced undergraduates held at the IAS/Park City Mathematics Institute. It is derived from both lectures (Chapters 1–10) and computer simulations (Chapters 11–13) that were held during the program. The material is coordinated so that some of the major computer simulations relate to topics covered in the first ten chapters. The goal is to present topics that are accessible to advanced undergraduates, yet are areas of current research in probability. The combination of the lucid yet informal style of the lectures and the hands-on nature of the simulations allows readers to become familiar with some interesting and active areas of probability.

The volume concludes with a number of problems ranging from routine to very difficult. Of particular note are problems that are typical of simulation problems given to students by the authors when teaching undergraduate probability.

**Student Mathematical Library**, Volume 2; 1999; 99 pages; Softcover; ISBN 0-8218-2029-X; List \$17; All AMS members \$14; Order code STML/2

### Supplementary Reading

### Miles of Tiles

Charles Radin, *University of Texas, Austin*

*In this book, we try to display the value (and joy!) of starting from a mathematically amorphous problem and combining ideas from diverse sources to produce new and significant mathematics—mathematics unforeseen from the motivating problem ...*

—from the Preface

The common thread throughout this book is aperiodic tilings; the best-known example is the “kite and dart” tiling. This tiling has been widely discussed, particularly

since 1984 when it was adopted to model quasicrystals. The presentation uses many different areas of mathematics and physics to analyze the new features of such tilings. Although many people are aware of the existence of aperiodic tilings, and maybe even their origin in a question in logic, not everyone is familiar with their subtleties and the underlying rich mathematical theory. For the interested reader, this book fills that gap.

**Student Mathematical Library**, Volume 1; 1999; 120 pages; Softcover; ISBN 0-8218-1933-X; List \$16; All AMS members \$13; Order code STML/1

### Advance Notice

### Independent Study

### Prime Numbers and Their Distribution

Gérald Tenenbaum, *Université Henri Poincaré, Nancy I, France*, and Michel Mendès France, *Université Bordeaux I, France*

From reviews for the French edition ...

*This is a short introductory book on analytic number theory. The prerequisites are quite modest, but it still contains an impressive amount of information. A multitude of results is included, some of which were proved just recently ... this book is very well written. It is fun to read and at the same time presents most of the fundamental concepts and ideas in analytic number theory.*

—Mathematical Reviews

There are two ways in which the book is exceptional. First, some familiar topics are covered with refreshing insight and/or from new points of view. Second, interesting recent developments and ideas are presented that shed new light on the prime numbers and their distribution among the rest of the integers.

This book is suitable for anyone who has had a little number theory and some advanced calculus involving estimates. Its engaging style and invigorating point of view will make refreshing reading for advanced undergraduates through research mathematicians. This book is the English translation of the French edition.

**Student Mathematical Library**; 2000; approximately 120 pages; Softcover; ISBN 0-8218-1647-0; List \$17; All AMS members \$14; Order code STML-TENENBAU

### Forthcoming in the Series...

### Problems in Mathematical Analysis I

### Real Numbers, Sequences and Series

W. J. Kaczor and M. T. Nowak, *Marie Curie-Skłodowska University, Lublin, Poland*

**Student Mathematical Library**; 2000; approximately 405 pages; Softcover; ISBN 0-8218-2050-8; List \$39; All AMS members \$31; Order code STML-NOWAK

All prices subject to change. Charges for delivery are \$3.00 per order. For optional air delivery outside of the continental U. S., please include \$6.50 per item. Prepayment required. - Transactions of the American Mathematical Society

Additional Products Available from the AMS

Notices of the American Mathematical Society  
Notices is one of the world's most widely read periodicals for professional mathematicians. In addition to publishing expository articles about mathematics research, information and news pertaining to the mathematics profession, and opinion pieces on a range of topics, the Notices serves as the journal of record for the AMS.

MathSciNet  
MathSciNet  
Mathematical Reviews on the Web  
MathSciNet is partnering with the AMS Journals program providing links to article reviews when they become available. Those with subscriptions to MathSciNet and AMS journals now have the ability to link from AMS journals into the MathSciNet database.

AMS Distributed Journals  
The AMS also distributes high-quality mathematics research, applied mathematics, and specialized mathematics journals from selected publishers around the world. Visit the AMS Bookstore and view a complete listing of journals.

30-day free trial!\*

#### Features and tools include:

- Refereed articles are posted as soon as they are edited and prepared for electronic publication, so articles will be available online to researchers significantly before print availability.
- Links from AMS journal articles to corresponding reviews in MathSciNet and from reviews in MathSciNet to original articles in AMS electronic journals.
- Linked PDF files with bookmarks.
- References available for FREE for users, in addition to article Abstracts; references contain links to MathSciNet reviews of articles from the AMS and other publishers.
- Easy browsing: Select and view recently posted articles, most recent issue, previous issue, or Table of Contents by issue.
- Secure manuscript tracking for authors.
- Easy access to TeX information.

#### Further benefits of subscribing to AMS electronic journals:

List of works that cite the on-screen article; Searching across all AMS electronic journals; Automatic email notification about posting of new articles available in your subject area.

# AMERICAN MATHEMATICAL SOCIETY

## New and Recent Titles from the Mathematical World Series

### Independent Study

#### Essays on Numbers and Figures

V. V. Prasolov, *Independent University of Moscow, Russia*

This is the English translation of the book originally published in Russian. It contains 20 essays, each dealing with a separate mathematical topic. The topics range from brilliant mathematical statements with interesting proofs, to simple and effective methods of problem-solving, to interesting properties of polynomials, to exceptional points of the triangle. Many of the topics have a long and interesting history. The author has lectured on them to students worldwide.

The essays are independent of one another for the most part, and each presents a vivid mathematical result that led to current research in number theory, geometry, polynomial algebra, or topology.

Volume 16; 2000; 75 pages; Softcover; ISBN 0-8218-1944-5; List \$15; All AMS members \$12; Order code MAWRDL/16

### Recommended Text

#### A Gentle Introduction to Game Theory

Saul Stahl, *University of Kansas, Lawrence*

*This book is an excellent introduction to the mathematical aspects of game theory for beginners without a background in calculus.*

—*Journal of Mathematical Psychology*

*Game theory, in the sense of von Neumann and Morgenstern, studies models of competition in situations of uncertainty. It provides a means for both deriving desirable strategies and explaining naturally occurring behavior; it finds applications ranging from economics and politics to evolutionary biology. All this and its intrinsic human interest (read here how it elucidates the outcome of the Cuban Missile Crisis) make it a favorite undergraduate topic, particularly for students majoring outside mathematics. There is not a faster read in the realm of higher mathematics. Recommended for college libraries. Undergraduates and up.*

—*CHOICE*

The mathematical theory of games was first developed as a model for situations of conflict, whether actual or recreational. It gained widespread recognition when it was applied to the theoretical study of economics by von Neumann and Morgenstern in *Theory of Games and Economic Behavior* in the 1940s. The later bestowal in 1994 of the Nobel Prize in economics on Nash underscores the important role this theory has played in the intellectual life of the twentieth century.

This volume is based on courses given by the author at the University of Kansas. The exposition is "gentle" because it requires only some knowledge of coordinate geometry; linear programming is not used. It is "mathe-

matical" because it is more concerned with the mathematical solution of games than with their applications.

Existing textbooks on the topic tend to focus either on the applications or on the mathematics at a level that makes the works inaccessible to most non-mathematicians. This book nicely fits in between these two alternatives. It discusses examples and completely solves them with tools that require no more than high school algebra.

In this text, proofs are provided for both von Neumann's Minimax Theorem and the existence of the Nash Equilibrium in the  $2 \times 2$  case. Readers will gain both a sense of the range of applications and a better understanding of the theoretical framework of these two deep mathematical concepts.

Volume 14

#### Kvant Selecta: Algebra and Analysis, II

Volume 15

Serge Tabachnikov, *University of Arkansas at Fayetteville*, Editor

These volumes are the first volumes of articles published from 1970 to 1990 in the Russian journal, *Kvant*. The influence of this magazine on mathematics and physics education in Russia is unmatched. This collection represents the Russian tradition of expository mathematical writing at its best.

Articles selected for these two volumes are written by leading Russian mathematicians and expositors. Some articles contain classical mathematical gems still used in university curricula today. Others feature cutting-edge research from the twentieth century.

The articles in these books are written so as to present genuine mathematics in a conceptual, entertaining, and accessible way. The volumes are designed to be used by students and teachers who love mathematics and want to study its various aspects, thus deepening and expanding the school curriculum.

The articles in the first volume are mainly devoted to various topics in number theory, whereas the second volume treats diverse aspects of analysis and algebra.

# Navigate Easily Throughout Mathematics Literature Using Enhanced MathSciNet Linking!

MathSciNet continues to expand its linking to original articles in online journals. There are now links to over 100,000 original articles, including from:

- **JSTOR**—offering 11 historical journals, with over 40,000 new links to articles from 1940 to present, including back volume issues of *American Journal of Mathematics*, *American Mathematical Monthly*, *Annals of Mathematics*, *Journal of Symbolic Logic*, *SIAM Journal on Applied Mathematics*, *SIAM Journal on Numerical Analysis*, *SIAM Review*, and the back issues of *Journal of the AMS*, *Mathematics of Computation*, *Proceedings of the AMS*, and *Transactions of the AMS*.
- **ScienceDirect™**—including over 70 journals from Elsevier Science and other publishers in key subject areas for mathematics and applied math
- **Electronic Journal of Combinatorics**

Other links include original articles and abstracts from:

- **Academic Press**—including 26 mathematics journals from IDEAL®
- **Oxford University Press**—offering 12 mathematics journals
- **Society for Industrial and Applied Mathematics (SIAM)**—accessing all 10 journals
- **New York Journal of Mathematics**
- **Pacific Journal of Mathematics**
- **American Mathematical Society (AMS)**—accessing all 8 journals

Link directly from article references of selected journals to their MathSciNet reviews. You can link from:

- **American Mathematical Society**—article references in all 8 AMS journals
- **ScienceDirect™**—HTML article references in over 1100 journals from Elsevier Science and other publishers

Bourgain, J. (LIASEP)  
Global wellposedness of defocusing critical nonlinear Schrödinger equation in the radial case. (English summary)  
*J. Amer. Math. Soc.* 12 (1999), no. 1, 145–171. [Original Article]

The author studies the global Cauchy problem for the nonlinear Schrödinger equations (NLS) in the energy space  $H^1_{loc}(\mathbb{R}^n) \times \dot{H}^{\frac{n-2}{4}}(\mathbb{R}^n)$ , where the critical power of the nonlinearity is equal to  $1 + 4/(n-2)$ . In the defocusing case, the Cauchy problem for the critical NLS has been conjectured by assumption on the data since the corresponding results on the focusing case were proved by Kenig and Ruiz. In this paper the conjecture is solved for  $n=3, 4$  in the radial case. The proof uses a new uniform bound of local solutions with respect to the space-time concentration effect of solutions. The proof of the last bound uses Strichartz, and pseudoconformal inequalities in a refined and

**Global wellposedness of defocusing critical nonlinear Schrödinger equation in the radial case**  
J. Bourgain

**Abstract.** We establish global wellposedness and scattering for the  $H^1$ -critical defocusing NLS in 3D

$$i\partial_t u + \Delta u - |u|u^4 = 0$$

assuming radial data  $\phi \in H^1$ ,  $s \geq 1$ . In particular, it proves global existence of classical solutions in the radial case. The same result is obtained in 4D for the equation

$$i\partial_t u + \Delta u - |u|u^2 = 0.$$

### FEATURED PUBLICATIONS

#### Lectures on Number Theory

**P. G. L. Dirichlet with  
supplements by R. Dedekind**

*Lectures on Number Theory* is the first of its kind on the subject matter. It covers most of the topics that are standard in a modern first course on number theory, but also includes Dirichlet's famous results on class numbers and primes in arithmetic progressions.

#### Miles of Tiles

**by Charles Radin**

This is the first volume in the Student Mathematical Library, a new series of undergraduate studies in mathematics. The common thread throughout this book is aperiodic tilings; the best-known example is the "kite and dart" tiling.

The presentation uses many different areas of mathematics and physics to analyze the new features of such tilings. The book's multidisciplinary approach and extensive use of illustrations make it useful for a broad mathematical audience.
