EXPERIMENTAL EVIDENCE CONCERNING TWO DIFFERENT KINDS OF SMECTIC \underline{C} TO SMECTIC \underline{A} TRANSITIONS*

ADRIAAN DE VRIES

(Received 18 July 1977)

ABSTRACT: Experimental evidence is presented indicating that there are two distinctly different kinds of smectic \underline{C} to smectic \underline{A} transitions. The first type is second order with zero tilt in both phases, the second type is first order with a non-zero tilt angle in both phases. The model for the second type of transition is an "uncoupling" of the tilt directions of adjacent layers in the smectic \underline{A} phase.

INTRODUCTION

It has been recognized by some authors^{1,2,3} that there are apparently two different types of smectic \underline{C} phases: those with a large and essentially temperature independent tilt angle (\underline{C}_1 phases^{3,4}) and those with a much smaller tilt angle that is strongly temperature dependent and goes to zero at the \underline{C} to \underline{A} transition (\underline{C}_2 phases^{3,4}). It has also been recognized that \underline{C}_1 phases never yield \underline{A} phases on heating, whereas \underline{C}_2 phases apparently always do^{1,3}.

Enlarging upon this subdivision we have noted earlier⁴ that there appears to exist a third type of \underline{C} phases, \underline{C}_3 phases, which also yield an \underline{A} phase on heating but with a different behavior of the tilt angle at the phase transition. In this note we now present new evidence that two different kinds of \underline{C} to \underline{A} transitions do in fact exist, and that they have quite dissimilar characteristics.

THE \underline{C}_2 TO \underline{A}_2 TRANSITION

This transition has most thoroughly been studied in TBBA. Taylor, Arora, and Fergason¹ were the first to report that for the \underline{C} phase of this compound the tilt angle is strongly temperature dependent and goes to zero at the \underline{C}_2 to \underline{A}_2 transition. This has been subsequently confirmed by EPR⁵, x-ray^{6,7}, and NMR^{2,8} measurements. The heat of transition has been found to be zero or very close to zero⁸, and McMillan's theory⁹--which was developed precisely for this kind of \underline{C} to \underline{A} transition--does indeed predict that this is a second order phase transition.

THE \underline{C}_3 TO \underline{A}_3 TRANSITION

No detailed information has been published so far on the \underline{C}_3 to \underline{A}_3 transition. The first indication of its existence was a report by Diele, Brand, and Sackmann¹⁰, which noted that for a number of compounds the thickness of the smectic layer did not change significantly over the full temperature range of the \underline{C} and \underline{A} phases combined. Since for other \underline{A} and \underline{C} phases there exists a strong one-to-one relationship between tilt angle and layer thickness¹¹, we postulated on the basis of this report that in these \underline{A} and \underline{C} phases, which we called \underline{A}_3 and \underline{C}_3 phases, the tilt angle remained constant⁴ also.

We have now obtained more extensive data on layer thickness as a function of temperature from our own investigation of one of the compounds reported on by Diele et al.¹⁰, and the results are represented in Figure 1. Although there is a considerable spread in the data due to random errors, it is clear that there is a very strong indication that the

FIGURE 1. Layer thickness in the smectic \underline{C} and \underline{A} phases of n -pentyl-4(4'- n -decyloxybenzylideneamino)-cinnamate. The vertical broken lines are the transition temperatures (\underline{B} - \underline{C} and \underline{C} - \underline{A}), the horizontal broken line is the expected layer thickness for molecules perpendicular to the layers (1.7 \AA less¹² than the length of the extended molecule, 37.27 \AA).

layer thickness, and therefore the tilt angle, indeed does not change significantly at the \underline{C}_3 to \underline{A}_3 phase transition. Also, it is quite evident that the tilt angle in the \underline{A}_3 phase is not zero as is generally assumed for \underline{A} phases; in our case it is approximately 15° . To reconcile this tilted arrangement of the molecules in a smectic layer with the observed optical uniaxial character of the \underline{A}_3 phase¹⁰, we suggest that in this phase the tilted layers are stacked in a random fashion^{4,13} (random with reference to the direction in which the molecules are tilted). In the \underline{C}_3 phase, as in all \underline{C} phases, the layers would be stacked in an ordered manner.

A literature search revealed interesting information on the enthalpy change for the \underline{C}_3 to \underline{A}_3 transition. For the C_{12} homologue of the compound investigated now by us--a compound also listed in the paper by Diele et al. as having the same layer thickness in the \underline{C} and the \underline{A} phase, and therefore virtually certain to have the same behavior of the tilt angle--it has been reported by Saupe¹⁴ that the enthalpy change for the \underline{C} - \underline{A} transition is 0.146 kcal/mol, about 6 times larger than for other \underline{C} - \underline{A} transitions listed by him. This \underline{C} to \underline{A} transition, a \underline{C}_3 to \underline{A}_3 transition, is therefore clearly a first order transition.

SUMMARY

For the \underline{C}_2 to \underline{A}_2 transition both theory and experiment appear to agree in indicating that this transition is second order and that the tilt angle is zero at the transition point.

The \underline{C}_3 to \underline{A}_3 transition, on the other hand, is clearly first order. The tilt angle remains constant at a value of about 15° during the transition, and the transition can be interpreted in terms of an "uncoupling" of the directions of tilt in adjacent layers. A similar \underline{C} - \underline{A} transition appears to have been found by De Jeu and De Poorter¹⁵.

ACKNOWLEDGEMENTS

It is a pleasure to thank Dr. M.E. Neubert and Larry Maurer for the synthesis of the compound, and Regina Dzurik and Arun Ekachai for their help in obtaining the data represented in Figure 1.
