CdSe–ZnS Quantum Dots as Resonance Energy Transfer
Donors in a Model Protein–Protein Binding Assay.

Page 472, Figure 5. The caption to Figure 5 incorrectly identified the emission spectra presented in the figure as arising from solutions of quantum dots conjugated to biotinilated bovine serum albumin (QD-bBSA). In fact, these spectra are from non-biotinilated QD-BSA, as described in the text. The caption should read as follows:

Figure 5. Emission spectra observed from ~15 nM QD–BSA, ~15 nM/120 nM QD–BSA/SAv–TMR, and 120 nM SAv–TMR solutions in 1 mM PBS buffer. An extracted SAv–TMR spectrum is also shown for comparison. The excitation wavelength was 400 nm.
