Catalyst development for organocatalytic hydrosilylation of aromatic ketones and ketimines†‡§

Andrei V. Malkov,*a,b Angus J. P. Stewart-Liddon,^a Grant D. McGeoch,^a Pedro Ramírez-López¶^a and Pavel Kočovský^{*a}

Received 4th March 2012, Accepted 24th April 2012 DOI: 10.1039/c2ob25472g

A new family of Lewis basic 2-pyridyl oxazolines have been developed, which can act as efficient organocatalysts for the enantioselective reduction of prochiral aromatic ketones and ketimines with trichlorosilane, a readily available and inexpensive reagent. 1-Isoquinolyl oxazoline, derived from mandelic acid, was identified as the most efficient catalyst of the series, capable of delivering high enantioselectivities in the reduction of both ketones (up to 94% ee) and ketimines (up to 89% ee).

Introduction

Asymmetric reduction of carbonyl and heterocarbonyl functionalities arguably belongs to the class of fundamental organic transformations. In the racemic realm, the reducing reagents, such as metal hydrides, are usually competent to reduce both ketones and ketimines.¹ However, the asymmetric methods that work well for ketones, are often considerably less efficient for ketimines, and vice versa.² There are only a limited number of catalytic systems that exhibit high selectivity with both compound classes, e.g., a highly efficient Cu-catalysed hydrosilylation of ketones and ketimines developed by Lipshutz et al^3 .

Asymmetric reduction of ketones 1 and ketimines 2 with trichlorosilane, catalysed by chiral Lewis bases (Scheme 1),

recently emerged as an efficient methodology⁴ capable of competing with the traditional, transition metal-mediated processes 2 and other organocatalytic methods.5,6 The field has witnessed an exponential growth in the last decade after Matsumura $et al.⁷$ had reported on useful enantioselectivities in the reduction of ketones (up to 43% ee) and ketimines (up to 66% ee), employing the proline-derived formamide 5b as a chiral catalyst (Chart 1). Formamides $5-8$,^{8,9} picolinamides $9-11$,¹⁰ and sulfinamides 12 and $13¹¹$ represent the major catalyst types for the asymmetric reduction of ketimines with trichlorosilane (Chart 1). Of these, the commercially available valine-derived Kenamide 6a and Sigamide 6b, developed by us , δ are among the most versatile catalysts, delivering high enantioselectivity over a broad substrate range. **Communiters Contents Contents for 17 June 2012** Published on 2012 **Published Contents Contents (Published on 2012)**

> In a preliminary communication¹² we have reported on a novel design of organocatalysts based on the pyridyl-oxazoline core, such as 14 and 16, which proved equally efficient in the reduction of aromatic ketones 1 and ketimines 2 (Scheme 1 and Chart 2). Later, Sun et al.^{9e} introduced catalyst 7c, which also shared that ability. Herein, we present a full account of the development of pyridyl-oxazoline type catalysts 14–28 and reveal new applications.

Results and discussion

Catalyst design and synthesis

Design of our catalysts has its origin in the successful series of chelating nitrogen ligands containing pyridine and oxazoline fragments;^{13,14} their selection is shown in Chart 2. The oxazolines derived from pyridine (14–21), quinoline (26), and isoquinoline (27) were synthesised following the method described by Brunner and Obermann as follows (Scheme 2):¹⁵ 2-cyano pyridines 29a–e were first converted into the corresponding imidates 30a–e by the reaction with a catalytic quantity of sodium methoxide in methanol. Acid-catalysed cyclisation of the latter

imidates 30a–e with the appropriate amino alcohols 31a–f afforded the desired oxazolines 14–21 in the yields ranging from 31% (18) to 89% (21). The preparation of $14-16^{12,15}$ and 26, 27^{12} was described earlier.

The reaction of chiral amino alcohols 31 with imidates 30 proceeds with retention of configuration at the stereogenic centre(s) as both amino and hydroxy groups of the amino alcohol act as nucleophiles, with methanol and ammonia being displaced from the imidate. In order to drive the equilibrium towards the oxazoline product, the reaction was carried out at an elevated temperature with argon bubbling through the reaction mixture to remove methanol and ammonia from the system.

Scheme 2 For R^1-R^6 in 19–21, see Chart 2.

The requisite amino alcohols 31 were synthesised in our laboratory, except for the commercially available (S)-leucinol 31a and (S)-phenylglycinol 31b. Thus, (S)-31c and (R) -31c were prepared from the (S) and (R) enantiomers of mandelic acid, respectively, which were first converted into the enantiomeric amides, followed by reduction with $LiAlH₄$.¹² The synthesis of amino alcohols 31d–f was accomplished in two steps via cyanation of the carbonyl compounds 32a–c, followed by reduction of the resulting nitriles (Scheme 3). Under the optimised conditions, the zinc(II)-catalysed cyanosilylation¹⁶ of the carbonyl functionality was carried out in neat trimethylsilyl cyanide to give the trimethylsilyl protected cyanohydrins, which were then in situ reduced with $LiAlH₄$ to afford racemic amino alcohols 31d–f.

Amino alcohol 31d was resolved by co-crystallisation with $(S)-(+)$ -mandelic acid from hot ethanol. After two crystallisations, (+)-31d was obtained in 92% ee, as revealed by chiral GC analysis. Resolution of the other amino alcohols was not attempted; however, the enantiomerically pure oxazoline 21 was obtained from a racemate by preparative chiral HPLC.

The synthesis of imidazolines (R) -22 and (R) -23 was achieved by the reaction of imidate 30a and diamines (R) -35 and (R) -38, respectively (Scheme 4). The latter diamines were synthesised from methyl phenylglycinate hydrochloride (R)-33 as follows: the latter starting material was converted into diamine (R) -35 in two steps by first forming amide (R) -34 with N-methylamine, followed by reduction with lithium aluminium hydride. To obtain amine (R) -38, ester (R) -33 was first converted into amide (R) -36 on reaction with aqueous ammonia. Amide (R) -36 was then treated with di-*tert*-butyl carbonate to give the Bocderivative (R) -37, which was subsequently reduced with lithium aluminium hydride to afford diamine (R) -38.

For the synthesis of 1-isoquinolyloxazoline 28, a different strategy was employed due to the high cost of 1-isoquinolinecarbonitrile (Scheme 5). The preparation commenced with amidation of the commercially available 1-isoquinoline carboxylic acid 39 with mandelamine (R) -31c using the mixed anhydride method. The resulting amide (R) -40 (89%) was then treated with mesyl chloride in the presence of triethylamine to effect cyclization, which proceeded with inversion of configuration at the stereogenic centre. The desired 1-isoquinoline oxazoline (S)-28 was recrystallised from ethanol and isolated as a white solid in 95% yield.

Synthetic sequences towards thiazolines 24 and 25 (as analogues of 16 and 28), are shown in Scheme 6. The synthesis of pyridyl-thiazoline 24 began with the preparation of thioester 42 from 2-chloromethylpyridine 41 on reaction with sulfur, followed by treatment with methyl iodide.¹⁷ The resulting thioester 42 was then coupled with amino alcohol (R) -31c in THF in the presence of triethylamine to afford thioamide (R) -43 (78%). Cyclization was then achieved by treating the latter thioamide with mesyl chloride, furnishing thiazoline (S)-24 (82%). Hydroxy amide (R) -40 was chosen as a starting material for the synthesis of catalyst (S) -25. First, thionation of the latter amide with Lawesson et al.'s reagent in $HMPA¹⁸$ was attempted but the conversion was very low and the desired thioamide could not be isolated from the crude reaction mixture. In a modified protocol, hydroxy amide (R) -40 was first converted into the TBDMS ether (R) -44; subsequent treatment with the Lawesson's reagent in toluene at 85 °C overnight, followed by acidic work-up and flash chromatography, was successful and furnished thiazoline (S)-25 in 78% yield. The latter thionation of 44 is accompanied by removal of the TBDMS protecting group and the resulting intermediate alcohol is then presumably derivatized by Lawesson's reagent,¹⁹ to generate a leaving group (via a P–O bond formation), followed by cyclisation to produce (S)-25 with inversion of configuration.

Asymmetric reduction of ketones with trichlorosilane

Our preliminary investigation focused on the reduction of aromatic ketones with trichlorosilane in the presence of 20 mol% of 2-pyridyl oxazolines (Table 1). Oxazolines (S)-14 and (S)-15, derived from phenylglycine and leucine, respectively, exhibited

modest conversion and enantioselectivity in the reduction of acetophenones 1a at −20 °C in chloroform (entries 1 and 2). Interestingly, under the same conditions, the isomeric oxazoline (S)-16, derived from mandelic acid, and with the chiral centre further away from the (presumably) coordinating nitrogen, catalysed the formation of alcohol (R) -3a at a better conversion (85%) and with an improved enantiomeric excess (78% ee, entry 4). A brief investigation of the solvent effect revealed a minor decrease in enantioselectivity for dichloromethane compared to chloroform (cf. entries 7 and 4); in THF, further drop in ee was accompanied by low conversion (entry 8), whereas in acetonitrile and toluene both conversion and ee were negligible. The reaction temperatures of -20 °C or -30 °C appear to be optimal in terms of performance (entries 4 and 5) but −20 °C is preferred for operational convenience. An expected fall in enantioselectivity was observed at room temperature (entry 3). On the other hand,

decreasing the temperature to −40 °C had a detrimental effect on both the conversion and enantioselectivity (entry 6).

The influence of steric and electronic properties of the pyridine moiety on the catalyst efficiency was investigated with the aid of 2-pyridyl oxazolines 17 and 18. It turned out that introduction of a phenyl substituent at the 6-position of the pyridine ring, as in 17, rendered the catalyst completely inactive (entry 20), presumably as a result of increasing the steric hindrance in the vicinity of the anticipated coordination site. Increasing the Lewis basicity of the pyridine nitrogen by incorporating the electron-donating 4-methoxy substituent (18) did not improve the catalyst activity either (entry 21).

The initial screening identified 2-pyridyl oxazoline (S)-16 as the best catalyst and CHCl₃ at -20 °C as the optimal reaction conditions. Next, the reaction scope was assessed by employing a range of ketones 1a–l (Table 1). Propiophenone 1b (entry 9)

Table 1 Reduction of ketones with trichlorosilane^a

 a The reactions were carried out at 0.4 mmol scale using 20 mol% catalyst loading. Conversion and ee's were determined by chiral GC.

reacted similarly to acetophenone 1a (cf. entries 9 and 4) but the more sterically demanding isopropylphenyl ketone 1c proved unreactive (entry 10). 2-Acetylnaphthalenes 1d and 1e, and 4 methylacetophenone 1f were more reactive than 1a, showing enantioselectivities around 80% ee (entries 11–13). Reduction of 4-methoxy acetophenone 1h (entry 15) turned out to be less enantioselective (43% ee), which may stem from partial racemisation of the scalemic product under the reaction conditions or during the workup. This reaction was also accompanied by a notable formation of by-products. The latter effect, however, was not manifested in the case of the 2-methoxy isomer 1g (entry 14), which gave the product of practically the same enantiopurity as 1a. Electron-withdrawing substituents in 1i and 1k had a detrimental effect on the reaction rates and led to lower enantioselectivities (entries 16, 18). 2-Bromoacetophenone 1j, which represents a combination of the unfavourable electronic and steric factors, was found to be completely inactive (entry 17). Finally, the non-aromatic ketone 1l gave a racemic product (entry 19).

The encouraging level of enantioselectivities attained with catalyst 16 set the scene for further development. First, we focused on lowering the relatively high catalyst loading (20 mol%). Since we observed that the oxazoline moiety of (R) -16 was undergoing a slow, chloride-promoted ring opening, giving rise to the chloro derivative (S) -45 (Scheme 7), we initially focused on this problem. It can be assumed that in the reaction mixture the oxazoline ring is strongly activated towards nucleophilic attack either by protonation (originating from the HCl that is always present in $Cl₃SiH$ as a contaminant) or by coordination of the Lewis-acidic silicon,²⁰ either of which could

Scheme 7

facilitate the undesired gradual ring-opening at the benzylic position.

In an attempt to discourage the chloride-promoted ring opening of the oxazoline moiety, 2-pyridyloxazolines 19–21 (Chart 2) were synthesised.²¹ The ring opening *via* an S_N 2 mechanism should be blocked in 19, although the susceptibility to S_N1 would be increased. Ring opening via S_N1 mechanism would be disfavoured in the case of 20, where the electron-withdrawing trifluoromethyl group in the aryl ring should destabilise the carbocation intermediate. This does however increase the electrophilicity of the benzylic carbon and thus the likelihood of an S_N2 reaction. Finally, a neopentyl carbon centre, as in the t-butyl substituted oxazoline 21, should disfavour the ring opening by either mechanism. However, neither of the new catalysts 19–21 (Table 2) turned out to be able to bring any advantage over the mandelic acid-derived 16 (compare entry 1 with entries 2–4). The drop in enantioselectivity for (S)-19 is likely to originate in the steric hindrance introduced by the methyl to the bottom face of the catalyst. Only the oxazoline (S)-21, carrying a t-Bu group, performed comparably to 16 (entry 4). Anyway, in all three cases, the oxazoline moiety was found to undergo gradual decomposition.

Next, we reasoned that replacing the oxazoline moiety with imidazoline or thiazoline fragments (22–25) would prevent the chloride-promoted ring-opening as the decreased electronegativity of nitrogen and sulfur should reduce the propensity for a nucleophilic attack at the benzylic position. Pyridine imidazolines (R) -22 and (R) -23 and thiazoline (S) -24 can be viewed as analogues of 2-pyridyl oxazolines (R) -14 and (R) -16, whereas thiazoline (S)-25 represents an analogue with an extended aromatic system. However, catalysts 22–24 turned out to be considerably less reactive than the parent oxazoline 16 (Table 2, entries 5–7). Only thiazoline 24 showed acceptable enantioselectivity (entry 7), whereas imidazolines 22 and 23 produced much lower ee and the isoquinoline-derived oxazoline 25 was found to be inert (entry 8). Thus, although these new catalysts did not bring about any improvement in terms of activity, the imidazoline and thiazoline moieties proved to be stable (compared to the oxazolines), as no decomposition was observed under the reaction conditions.

The reactivity of ketones in the reduction with trichlorosilane catalysed by 16 displays a good correlation with their Brønsted basicity (pK_{HB}): 2-MeO–C₆H₄COMe (1.34) > PhCOMe (1.11) $> 2-F-C_6H_4COMe$ (0.90).²² Assuming that this trend can be extrapolated to Lewis basicity, this behaviour suggests that, in the transition state, the carbonyl oxygen is either coordinated to the weakly Lewis acidic trichlorosilane or connected to the catalytically active species via hydrogen bonding (originating from the omnipresent traces of HCl).²³ A linear relationship observed between the enantiopurity of the catalyst and the product of the reduction of acetophenone 1a with trichlorosilane catalysed by 16 indicates that only one molecule of the catalyst is actively participating in the enantiodiscriminating step.¹² Based on the available experimental data, we can tentatively suggest possible transition structures (Scheme 8): N,N-Chelation of trichlorosilane

by the catalyst can be predicted to generate an activated hypervalent species A, which then coordinates the carbonyl group upon replacement of a chloride atom to form B. Alternatively, the catalyst could act in a monodentate fashion, whereby the protonated second nitrogen serves as a hydrogen bond donor for the incoming ketone (C). The lack of enantioselectivity for non-aromatic ketones may also suggest a potential role of arene–arene interactions in the enantiodiscrimination event.²⁴ In the related Lewis base-catalysed addition of allyltrichlorosilanes to aromatic aldehydes, computational analysis indicated a substantial contribution of arene–arene interactions between the catalyst and the substrate to the stereochemical outcome of the process.²⁵ Therefore, quinoline (26) and isoquinoline (27 and 28) derivatives, featuring an extended π-system, were synthesised. The results of the catalytic reduction of ketones with trichlorosilane employing these catalysts are presented in Table 3.

No reduction was observed with quinoline (R) -26 (Table 3, entry 1), presumably due to the steric constraints in the frontal part,²⁶ imposed by the quinoline moiety, mirroring the behaviour of the pyridine analogue 17 substituted at the 6-position (Table 1, entry 20). The 3-isoquinoline catalyst (R) -27 was approximately as efficient as the parent pyridine catalyst 16 (Table 3, entry 2). A real improvement was attained with the 1-isoquinoline catalyst (S)-28 (entries 3 and 4). The enhanced reactivity of 1-isoquinoline (S)-28 allowed to reduce the catalyst loading to 10 mol% with no adverse effect on enantioselectivity (Table 3, entry 5). This trend was consistent across a range of aromatic ketones (entries 6–11) with the highest enantioselectivity of 94% ee attained for the reduction of 2-acetylnaphthalene 1d (entry 7). Similarly to the results obtained with the pyridine analogue 16, 2-fluoroacetophenone 1i was reduced with lower selectivity (entry 11), whereas the aliphatic ketone 1l afforded a racemic product (entry 12). Reduction of benzylidene acetone 1m gave solely the product of 1,2-addition, albeit in low enantioselectivity (entry 13). Furthermore, the reaction was accompanied by dimerisation of the resulting alcohol to give a mixture of diastereoisomeric ethers 48 (entry 13). Formation of ethers 47, though in smaller quantities, was also observed for the reduction of 1g (entry 10). Next, we massaved that replacing the ocasoline moisty with by the omalys can be predicted to generate an activated by positive deprediction of rigority on the dependent of properties on the dependent of the control of the

Asymmetric reduction of ketimines with trichlorosilane

Significantly, 2-pyridyl oxazolines were also found to be active in the reduction of N -aryl ketimines.¹² Preliminary results demonstrated that the pyridine-derived catalyst 16 (Table 4, entry 1) promoted the reduction of ketimine 2a derived from acetophenone with good yield and moderate enantioselectivity. The asymmetric induction was improved dramatically by employing the isoquinoline-derived catalyst (S)-28. The optimal

conditions mirrored those identified for the reduction of ketones: chloroform emerged as the best solvent (compare entries 2–5), while running the reaction at −20 °C provided a good balance between reactivity and enantioselectivity. The enantioselectivity remained consistently high for a range of imines including heterocyclic substrates (entries 7–20). Significantly, even the

pyridine-derived substrates 2k and 2l, notoriously known to be difficult to reduce enantioselectively,^{8g} were efficiently reduced by employing (S)-28 (entries 16, 17). Reduction of imines 2m–2o derived from α-chloroketones proceeded in high enantioselectivity to afford the respective chloroamines 4m–4o (entries 18–20), which serve as precursors in the synthesis of terminal aziridines showing pesticide activity.^{8d}

The sense of asymmetric induction for the reaction of imines is similar to that observed in the case of ketones, so that a similar mechanism can be envisaged. The coordination of trichlorosilane to the nitrogen of the imine is unlikely, as this would create a very crowded environment. Hence, a hydrogenbonding interaction with the catalyst, similar to structure C shown in Scheme 8, with the C=N–R³ group of the imine 2 in place of the $C=O$ group, can be envisioned. However, in the absence of comprehensive kinetic and computational data we are currently unable to provide a more detailed mechanistic picture.

Conclusions

We have developed a new family of Lewis-basic 2-pyridyl oxazolines, which can act as efficient organocatalysts for the enantioselective reduction of prochiral aromatic ketones and ketimines with trichlorosilane, a readily available and inexpensive reagent. 1-Isoquinoline derivative 28 was identified as the most efficient catalyst of the series capable of delivering high enantioselectivities in the reduction of both ketones (up to 94% ee) and ketimines (up to 89% ee) and we propose to name it "Angusoline" in appreciation of the contribution made by one of us (A.J.P.S.L.).

Experimental section

General methods

All reactions, unless otherwise stated, were run under an inert atmosphere in oven dried glassware. Room temperature refers to ambient room temperature (20–22 °C), 0 °C refers to an ice slush bath. Heated experiments were conducted using thermostatically controlled oil baths. Reactions were monitored by thin layer chromatography (TLC) using aluminium backed silica gel 60 (F_{254}) plates, visualised using UV_{254 nm} and potassium permanganate, phosphomolybdic acid or Dragendorf dips as appropriate. Flash chromatography was carried out routinely using 60 Å silica gel (Fischer). Melting points were determined on a Kofler block and are uncorrected. Optical rotations were recorded at 25 °C unless otherwise indicated with an error of $< \pm 0.1$. The $[\alpha]_D$ values are given in 10^{-1} deg cm² g⁻¹. The NMR spectra were recorded for $CDCl₃$ solutions, ${}^{1}H$ at 400 MHz and ¹³C at 100.6 MHz with chloroform-d₁ (δ 7.26, ¹H; δ 77.0, ¹³C) as an internal standard unless otherwise indicated. Coupling patterns are designated as follows: s – singlet, d – doublet, t – triplet, dd – doublet of doublets, ddd – doublet of doublet of doublets, $tt - triplet$ of triplets, hept – heptet, m – multiplet, br – broad. Various 2D techniques and DEPT experiments were used to establish the structures and to assign the signals. The IR spectra were recorded for a thin film between NaCl plates, in a solid by the Golden Gate technique, or as a KBr disc. The mass spectra (EI and/or CI) were measured on a

high resolution, dual sector mass spectrometer using direct inlet and the lowest temperature enabling evaporation. Enantiomeric excess was determined by GC (Supelco β-DEXTM 120 fused capillary column, 30 m \times 0.25 mm \times 0.25 µm film thickness) or HPLC analysis as specified.

Materials

All solvents for the reactions were of reagent grade and were dried and distilled under argon or nitrogen immediately before use as follows: tetrahydrofuran, diethyl ether and toluene from sodium–benzophenone, dichloromethane from calcium hydride, chloroform from phosphorous pentoxide, methanol from magnesium turnings. Petroleum ether refers to the fraction boiling in the range 40–60 °C. Yields are given for isolated products showing one spot on a TLC plate and no impurities detectable in the NMR spectrum. The identity of the products prepared by different methods was checked by comparison of their NMR spectra. Imines 2a–2o are known compounds and were prepared according to literature method.^{8g} Oxazolines $14-16$, 12.14 ⁻ 26 ¹⁴ and 27^{14} are known compounds. pyridins-derived anbitrates 2k and 2h, associonary known to be high resolution, dual sceter mass apectronecter unit

General procedure for the asymmetric reduction of ketones 1 with trichlorosilane

Trichlorosilane (86 μL, 0.84 mmol, 2.1 equiv.) was slowly added dropwise to a solution of the catalyst (21.9 mg, 0.08 mmol or 11.0 mg, 0.04 mmol) and the ketone (0.40 mmol, 1.0 equiv.) in CHCl₃ (2 mL) at -20 °C. The reaction mixture was stirred at -20 °C for 24 h, after which time saturated aqueous NaHCO₃ (1 mL) was added to quench the reaction. The mixture was extracted with CH_2Cl_2 (3 × 10 mL) and the combined organic extracts were dried over MgSO₄. Concentration in vacuo followed by flash chromatography on silica gel with CH_2Cl_2 afforded sec-alcohols 3a, 3b, 3d–3i, 3k, 3l. Configuration of alcohols 3a, 3b, 3d–3i, 3k was established by comparison of their optical rotations and their HPLC (Chiracel OD-H or AD columns) and GC retention times with the literature data and with the behaviour of authentic samples. Enantioenriched alcohols 3a, 3b, 3d–3i, 3k, 3l were described by us previously, 12 alcohol $3m$ is also a known compound.²⁷

General procedure for the asymmetric reduction of imines 2 with trichlorosilane

Trichlorosilane (82 μL, 0.80 mmol, 2.0 equiv.) was slowly added dropwise to a solution of the catalyst (21.9 mg, 0.08 mmol) and the imine (0.40 mmol, 1.0 equiv.) in CHCl₃ (2 mL) at -20 °C. The reaction mixture was stirred at −20 °C for 24 h, after which time saturated aqueous $NaHCO₃$ (1 mL) was added to quench the reaction. The mixture was extracted with CH_2Cl_2 $(3 \times 10 \text{ mL})$ and the combined organic extracts were dried over MgSO4. Concentration in vacuo followed by flash chromatography on silica gel afforded amines 4a–4o. Configuration of the amines (where known) was established by comparison of their optical rotations and their HPLC (Chiracel OD-H, IB or AD columns) retention times with the literature data and with the behaviour of authentic samples. All amines 4a–4o are known compounds. 8d,g

 $(S)-(+)$ -2- $(6'-Phenyl-2'-pyridyl)$ -5-phenyl-1,3-oxazoline (S)-(+)-(17). Sodium methoxide (20 mg, 0.37 mmol, 0.13 equiv.) was added to a solution of 6-phenyl-2-cyanopyridine $29b^{28}$ (500 mg, 2.78 mmol, 1.0 equiv.) in MeOH (15 mL) and the reaction mixture was stirred at room temperature overnight. The reaction was then quenched with glacial acetic acid (2 drops) and the mixture was concentrated in vacuo. Warm ether was then added and the mixture was filtered. The filtrate was concentrated under reduced pressure and the residue was dissolved in chlorobenzene (4 mL). (S)-Aminoalcohol (+)-31d was then added, followed by conc. HCl (1 drop). The mixture was stirred at 80 °C for 3 days, with argon gas bubbled through the solution. Concentration in vacuo followed by purification via flash chromatography on silica gel, eluting with a hexane–ethyl acetate–triethylamine mixture $(2:1:0.03)$ gave the pyridine oxazoline (S)-17 (523 mg, 63%): mp 60–62 °C (CH₂Cl₂); $[\alpha]_D$ +104.6 (c 1.1, CHCl₃); IR (KBr) v 1637 (C=N), 2873, 2932 (CH–CH₂), 3032, 3060 (Ar–H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ_H 4.03 (dd, J = 15.2, 8.2 Hz, 1H), 4.50 (dd, J = 15.2, 10.2 Hz, 1H), 5.69 (dd, $J = 10.2$, 8.2 Hz, 1H), 7.24–7.43 (m, 8H), 7.77–7.79 (m, 2H), 7.84–7.94 (m, 1H), 8.00–8.03 (m, 2H); ¹³C NMR (100 MHz, CDCl₃) δ_C 63.8 (CH₂), 82.1 (CH), 122.7 (CH), 122.8 (CH), 126.3 (2 × CH), 127.6 (2 × CH), 128.8 (CH), 129.1 (2 × CH), 129.2 (2 × CH), 129.7 (CH), 137.8 (CH), 139.0 (C), 141.2 (C), 147.0 (C), 158.1 (C), 163.9 (C); EI MS m/z (%) 300 (M⁺ ˙, 65), 193 (100), 154 (15), 127 (16), 118 (12), 77 (8); HRMS (EI) 300.1260 (C₂₀H₁₆N₂O requires 300.1263). behaviour of authentic samples. (S)-(+)-2-(4′-Methoxy-2′-pyridyl)-5-phenyl-1,3-oxazoline (S)-(+)-(18). Sodium methoxide (18 mg, 0.33 mmol, 0.12 equiv.) was added to a solution of 4-methoxy-2-cyanopyridine 29c (361 mg, 2.69 mmol, 1.0 equiv.) in MeOH (15 mL) and the reaction mixture was stirred at room temperature overnight. The reaction was then quenched with glacial acetic acid (2 drops) and the mixture was concentrated in vacuo. Warm ether was then added and the mixture was filtered. The filtrate was concentrated under reduced pressure and the residue was dissolved in chlorobenzene (4 mL). (S) -(+)-Amino alcohol (S) -31c (392 mg, 2.86 mmol, 1.1 equiv.) was then added, followed by conc. HCl (1 drop). The reaction mixture was stirred at 80 °C for 3 days, with argon gas bubbled through the solution. Concentration in vacuo, followed by purification via flash chromatography on silica gel (ethyl acetate–methanol, 25 : 1), gave pyridine-oxazoline (S)-18 (215 mg, 31%) as a clear oil: $\lbrack \alpha \rbrack_{D}$ +74.9 (c 0.9, CHCl₃); IR (neat) v 2873, 2939 (CH–CH₂–CH₃), 3030, 3063 (Ar–H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ _H 3.84 (s, 3H), 4.01 (dd, $J = 15.2$, 8.2 Hz, 1H), 4.47 (dd, $J = 15.2$, 10.2 Hz, 1H), 5.67 (dd, $J = 10.2$, 8.3 Hz, 1H), 6.85 (dd, $J = 5.7$, 2.6 Hz, 1H), 7.24–7.31 (m, 5H), 7.55 (d, $J = 2.6$ Hz, 1H), 8.46 (d, $J =$ 5.7 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ _C 55.9 (CH₃), 63.5 (CH₂), 82.3 (CH), 109.8 (CH), 112.7 (CH), 126.4 (2 × CH), 128.2 (CH), 129.2 (2 × CH), 140.9 (C), 148.6 (C), 151.4 (C), 163.7 (C), 166.5 (C); EI MS m/z (%) 254 (M⁺⁺, 100), 195 (7), 166 (8), 148 (95), 108 (72), 84 (65), 77 (9), 47 (11); HRMS (EI) 254.1054 ($C_{15}H_{14}N_2O_2$ requires 254.1055).

 (S) - $(-)$ -2- $(2'$ -Pyridyl)-5-methyl-5-phenyl-1,3-oxazoline (S) -(-)-(19). Adapting the protocol of Brunner and Obermann¹⁵ amino alcohol (−)-31d (570 mg, 4.17 mmol, 1.0 equiv.) was added to a solution of methyl pyridine-2-carboxyimidate 30a $(567 \text{ mg}, 4.17 \text{ mmol}, 1.0 \text{ equiv.})$ in chlorobenzene (5 mL) . A drop of conc. HCl was added and the reaction mixture was stirred at 80 °C overnight with argon bubbled through the solvent. The solvent was then removed and purification via column chromatography (ethyl acetate–methanol, 40 : 1) afforded (−)-19 (812 mg, 82%) as a clear oil: $[\alpha]_D$ –171.5 (c 1.07, CHCl₃); IR v (KBr) 1673 (C=N); 2869, 2930, 2975 $(CH-CH_2-CH_3)$, 3027 (aryl-H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ_H 1.89 (s, 3H), 4.22 (d, J = 14.8 Hz, 1H), 4.23 (d, J = 14.8 Hz, 1H), $7.29-7.45$ (m, 6H), 7.84 (td, $J = 8.0$, 2.0 Hz, 1H), 8.13 (d, $J = 7.6$ Hz, 1H), 8.80 (d, $J = 4.8$ Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ_C 28.1 (CH₃), 69.1 (CH), 87.7 (C), 123.8 (CH), 124.3 (2 \times CH), 125.5 (CH), 127.4 (CH), 128.5 (2 \times CH), 136.6 (CH), 145.1 (C), 146.9 (C), 149.9 (CH), 162.3 (C); EI MS m/z (%) 238 (M⁺⁺, 20), 118 (100), 91 (15), 78 (80), 77 (10), 51 (10); HRMS (EI) 238.1107 ($C_{15}H_{14}N_2O$ requires 238.1106).

(±)-2-(2′-Pyridyl)-5-(4′′-Trifluoromethylphenyl)-1,3-oxazoline (\pm) -(20). Adapting the procedure of Bruner,¹⁵ 2-amino-1-phenylethanol (\pm) -31e (754 mg, 3.68 mmol, 1.0 equiv.) was added to a solution of imidate 30a (500 mg, 3.68 mmol, 1.0 equiv.) in chlorobenzene (5 mL). A drop of conc. HCl was added and the reaction mixture was stirred at 80 °C overnight with argon bubbled through the solvent. The solvent was then removed in vacuo and purification of the residue via column chromatography on silica gel (ethyl acetate–triethylamine, 10 : 0.1) afforded oxazoline 20 (809 mg, 75%) as a yellow solid: mp 68–70 °C (CH₂Cl₂); IR v (KBr) 1643 (C=N), 2867, 2963 $(CH-CH_2)$ cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ_H 3.98 (dd, J = 15.4, 8.0 Hz, 1H), 4.53 (dd, $J = 15.4$, 10.4 Hz, 1H), 5.73 (dd, $J = 10.4$, 8.0 Hz, 1H), 7.37 (ddd, $J = 7.6$, 4.8, 0.8 Hz, 1H), 7.43 (d, $J = 8.0$ Hz, 2H), 7.57 (d, $J = 8.0$ Hz, 2H), 7.76 (td, $J = 8.0$, 2.0 Hz, 1H), 8.03 (d, $J = 8.0$ Hz, 1H), 8.69 (dd, $J = 4.8$, 0.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ _C 63.3 (CH₂), 80.9 (CH), 124.0 (q, $^{1}J_{CF}$ = 246 Hz, [CF₃], 124.0 (2 × CH), 125.8 (C), 125.9 (CH), 125.9 (CH), 126.1 (2 × CH), 130.6 (q, $^2J_{CF} = 32$ Hz, [C]), 136.8 (CH), 144.6 (C), 146.3 (C), 150.0 (CH); EI MS m/z (%) 292 (M⁺, 75), 273 (5), 186 (10), 159 (7), 118 (100), 106 (7), 78 (98), 51 (10); HRMS (EI) 292.0822 (C₁₅H₁₁F₃N₂O requires 292.0823).

(+)-2-(2′-Pyridyl)-5-tert-butyl-1,3-oxazoline (+)-(21). Adapting the protocol of Brunner and Obermann,¹⁵ 1-amino-3,3-dimethylbutan-2-ol (±)-31f (430 mg, 3.68 mmol, 1.0 equiv.) was added to a solution of methyl pyridine-2-carboxyimidate (500 mg, 3.68 mmol, 1.0 equiv.) in chlorobenzene (5 mL). A drop of conc. HCl was added and the reaction mixture was stirred at 80 °C overnight with argon bubbled through the solvent. The solvent was then removed in vacuo and purification of the residue via column chromatography on silica gel (ethyl acetate– methanol, 20:1) afforded oxazoline (\pm) -21 (671 mg, 89%) white solid: mp 73–75 °C (CH₂Cl₂); IR (KBr) v 1644 (C=N), 2869, 2958 (CH–CH₂–CH₃), 3066 (aryl-H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ_H 0.91 (s, 9H), 3.81 (dd, J = 15.2, 8.0 Hz, 1H), 3.98 (dd, $J = 15.2$, 10.4 Hz, 1H), 4.44 (dd, $J = 10.4$,

8.0 Hz, 1H), 7.31 (ddd, $J = 7.6$, 4.8, 1.2 Hz, 1H), 7.70 (td, $J =$ 7.6, 1.6 Hz, 1H), 7.92 (d, $J = 7.6$ Hz, 1H), 8.66 (dd, 4.0, 0.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ _C 24.8 (3 × CH₃), 34.0 (C), 55.9 (CH2), 88.4 (CH), 123.6 (CH), 125.4 (CH), 136.6 (CH), 146.9 (C), 149.9 (CH), 163.5 (C); EI MS m/z (%) 204 (M⁺', 15), 147 (100), 119 (35), 92 (50), 78 (55), 51 (10); HRMS (EI) 204.1261 ($C_{12}H_{16}N_2O$ requires 204.1263). The racemate was resolved by preparative chiral HPLC on a Chiralpak AD column (Heptane-2-Propanol, $98:2$, 1 mL min⁻¹) to give $(+)$ -21: $[\alpha]_D$ +24.0 (c 0.9, CHCl₃) and the respective (−)-21.

 (R) -(+)-2-(2'-Pyridyl)-1-methyl-4-phenyl-imidazoline (R) -(+)-(22). A solution of diamine (R) -35 (500 mg, 3.7 mmol, 1.0 equiv.) in PhCl (5 mL) was added to a solution of imidate 30a (500 mg, 3.7 mmol, 1.0 equiv.) in chlorobenzene (10 mL). The reaction mixture was stirred at 80 °C overnight with argon bubbling through the solution. The solvent was then removed from the resultant dark brown paste under reduced pressure and the crude product was purified via flash chromatography on silica gel (ethyl acetate–methanol–triethylamine, 9 : 1 : 0.1) to give imidazoline (R)-22 (732 mg, 84%) as a yellow oil: $[\alpha]_D$ +11.9 (c 1.0, CHCl₃); IR (KBr) v 1522, 1670 (aryl ring), 2797, 2848, 2937 (CH–CH₂–CH₃), 3029, 3059 (Ar–H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ_H 3.12 (s, 3H), 3.40 (t, J = 9.4, 1H), 4.01 (dd, $J = 10.9$, 9.4 Hz, 1H), 5.21 (dd, $J = 10.7$, 9.7 Hz, 1H), 7.28–7.29 (m, 1H), 7.35–7.40 (m, 5H), 7.79 (td, $J = 7.6$, 1.6 Hz, 1H), 7.91 (dt, $J = 7.6$, 0.8 Hz, 1H), 8.69 (dd, $J = 4.8$, 1.6, 0.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ _C 36.2 (CH₃), 62.5 (CH₂), 68.0 (CH), 124.9 (CH), 125.0 (CH), 127.2 (2 \times CH), 127.5 (CH), 128.9 (2 × CH), 137.1 (CH), 144.5 (C), 149.0 (CH), 150.9 (C), 165.5 (C); CI MS m/z (%) 238 ([M + H]⁺, 100); HRMS (CI) 238.1341 (C₁₅H₁₆N₃ requires 238.1344). SO Hz, 1H), 7.21 (dd, $J = 76, 48, 12$ Hz, 1H), 7.70 (d, $J =$ was then added and the mixture was extracted with CH₂(13 April 2013). The properties that the CH2(13 April 2013). The comparison of the angle of the angle of

 (R) - $(-)$ -2- $(2'$ -Pyridyl $)$ -1-methyl-5-phenyl-imidazoline (R) - $(-)$ - (23) . Diamine (R) -38 (926 mg, 6.13 mmol, 1.0 equiv.) was added to a solution of imidate 30a (840 mg, 6.13 mmol, 1.0 equiv.) in chlorobenzene (2.0 mL) and the reaction mixture was stirred at 60 °C overnight with argon bubbling through the solution. The solvent was then removed from the resultant dark brown paste under reduced pressure and the crude product was purified via flash chromatography on silica gel (ethyl acetate) to give imidazoline (R)-23 (906 mg, 62%) as a yellow oil: $[\alpha]_D$ –86.2 (c 0.67, CHCl3); IR (KBr) ν 1671, 1590, 1495 (aryl ring), 2858, 2920 (CH–CH₂CH₃), 3029, 3060 (Ar–H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) $\delta_{\rm H}$ 2.88 (s, 3H), 3.67 (dd, J = 14.8, 10.8 Hz, 1H), 4.29 (dd, $J = 14.8$, 10.8 Hz, 1H), 4.53 (t, $J = 10.8$ Hz, 1H), 7.22–7.34 (m, 6H), 7.72 (td, 7.6, 0.4 Hz, 1H), 7.88 (d, $J =$ 7.6 Hz, 1H), 8.60 (d, $J = 4.4$ Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ_C 34.2 (CH₃), 62.7 (CH₂), 70.4 (CH), 124.6 (2 × CH), 127.2 (2 × CH), 127.8 (C), 128.8 (2 × CH), 136.7 (CH), 147.5 (C), 148.7 (CH), 150.5 (C), 165.1 (C); EI MS m/z (%) 237 (M⁺⁺, 75), 236 (10), 222 (6), 207 (4), 160 (15), 133 (100), 118 (50), 78 (80), 77 (12), 51 (10); HRMS (EI) 237.1268 (C₁₅H₁₅N₃ requires 237.1266).

 (S) - $(-)$ -2- $(2'$ -Pyridyl $)$ -5-phenyl-thiazoline (S) - $(-)$ - (24) . Mesyl chloride (0.57 mL, 7.01 mmol) and triethylamine (2.15 mL, 14.3 mmol) were added to a solution of (S) -43 (1.29 g, 4.99 mmol) in THF (15 mL) at 0 $^{\circ}$ C and the reaction mixture was allowed to stir at room temperature for 48 h. Water (10 mL)

was then added and the mixture was extracted with CH_2Cl_2 (3 \times 20 mL). The organic layer was washed with water $(2 \times 20 \text{ mL})$ and dried over $MgSO₄$ and the solvent removed in vacuo. The crude solid was purified by chromatography on a column of silica gel (20 g) with a mixture of petroleum ether and AcOEt (1 : 1) to afford an off white solid, which was recrystallised from EtOH to afford thiazoline (S) - $(-)$ -24 as a white crystalline solid (0.98 g, 82%); mp 105–106 °C; $\lbrack \alpha \rbrack_{D}$ –77.50 (c 1.0, CHCl₃); ¹H NMR (400 MHz, CDCl₃) δ_H 4.60 (dd, J = 16.4, 5.8 Hz, 1H), 4.82 (dd, $J = 16.4$, 9.1 Hz, 1H), 4.99 (dd, $J = 9.1$, 5.8 Hz, 1H), 7.17–7.33 (m, 6H), 7.73 (dt, $J = 7.8$, 1.8 Hz, 1H), 8.05 (dt, $J =$ 7.8, 1.0 Hz, 1H), 8.60 (ddd, $J = 4.8$, 1.0, 0.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ_C 53.5 (CH), 73.9 (CH₂), 121.6 (CH), 125.5 (CH), 127.2 (CH), 127.7 (CH), 128.9 (CH), 136.6 (CH), 142.2 (C), 149.4 (CH), 151.2 (C), 170.2 (C); MS EI + m/z (%) 240.1 (M+, 100), 118.0 (49), 78.0 (74), 51.0 (20); HRMS (EI) 240.0721 ($C_{14}H_{12}N_2S$ requires 240.0718).

 (S) - $(-)$ -2-(1'-Isoquinolyl)-5-phenyl-thiazoline (S)- $(-)$ -(25). A solution of amide (R) -44 (253 mg, 0.71 mmol) and Lawesson's reagent (344 mg, 0.85 mmol) in toluene (20 mL) was heated at 85 °C overnight. The reaction mixture was then allowed to cool to room temperature, aqueous 2 M HCl (20 mL) was added, and the precipitate was removed by filtration. After separation of the organic layer, the aqueous phase was extracted with CH_2Cl_2 $(3 \times 30 \text{ mL})$ and the combined organic phases were washed with water (3×15 mL) and dried over MgSO₄. The solvent was then evaporated *in vacuo* and the residue was purified by chromatography on a column of silica gel with a mixture of petroleum ether and AcOEt $(5:1)$ to afford (S) - $(-)$ -25 as a yellow oil (161 mg, 74%): $[\alpha]_D$ –22.9 ($c = 1.0$, CHCl₃); ¹H NMR (400 MHz, CDCl₃) δ_H 4.78 (1H, dd, J = 4.3, 15.2 Hz, 2-H), 4.83–4.89 (1H, m, 1α-H), 5.02–5.06 (1H, m, 1β-H), 7.17 (m, 1H), 7.21–7.25 (m, 2H), 7.33–7.35 (m, 2H), 7.59–7.66 (m, 3H), 7.89–7.97 (m, 1H), 8.52 (d, $J = 5.6$ Hz, 1H), 9.42 (dd, $J = 1.5$, 7.8 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ _C 52.2 (CH, C-2), 75.2 (CH₂, C-1), 123.2 (CH), 126.4 (C-3), 127.0 (CH), 127.2 (CH), 127.5 (CH), 127.6 (CH), 128.9 (CH), 130.4 (CH), 136.9 (C-14), 141.5 (CH), 142.4 (CH), 149.2 (C-9), 168.1 (C-8), 170.9 (C-7); MS EI m/z (%) 290.1 (M+, 100), 186.0 (44), 128.0 (92), 91.0 (28); HRMS (EI) 290.0878 (C₁₈H₁₄N₂S requires 290.0879).

(S)-(+)-2-(1′-Isoquinolyl)-5-phenyl-1,3-oxazoline (S)-(+)-(28). Triethylamine (2.5 mL, 17.78 mmol, 5.2 equiv.) was added to a solution of (R) -40 (1.00 g, 3.42 mmol, 1.0 equiv.) in CH₂Cl₂ (65 mL). The mixture was then cooled to 0° C and a solution of methanesulfonyl chloride (0.62 mL, 7.87 mmol, 2.3 equiv.) in CH_2Cl_2 (10 mL) was added dropwise over 15 min. The reaction mixture was then allowed to attain room temperature and stirred overnight. The reaction mixture was poured onto crushed ice, the aqueous layer was extracted with $CH₂Cl₂$, and the combined organic phase was washed with 5% aqueous HCl $(3 \times 40 \text{ mL})$, water (1 \times 40 mL), saturated aqueous NaHCO₃ (3 \times 40 mL), and brine $(1 \times 40 \text{ mL})$ and dried over MgSO₄. Concentration in vacuo then afforded a residue, which was purified via column chromatography on silica gel (petroleum ether–ethyl acetate, 1 : 1) to give 28 (0.89 g, 95%) as a white solid: mp 78–80 °C (CH₂Cl₂); $[\alpha]_D$ +83.5 (c 0.5, CHCl₃); IR (KBr) 700, 759, 838 (aryl), 1645 (C=N), 2866, 2931 (CH–CH₂), 3064 (aryl-H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ _H 4.29 (dd, *J* = 15.2, 8.0 Hz, 1H), 4.74 (dd, $J = 15.2$, 10.4 Hz, 1H), 5.84 (dd, $J = 10.4$, 8.0 Hz, 1H), 7.35–7.55 (m, 5H), 7.71–7.80 (m, 2H), 7.83 (d, J = 5.6 Hz, 1H), 7.92 (d, $J = 7.6$ Hz, 1H), 8.71 (d, $J = 5.6$ Hz, 1H), 9.28 (d, $J = 8.8$ Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ_c 63.9 (CH₂), 80.7 (CH), 123.5 (CH), 126.1 (2 \times CH), 127.2 (CH), 127.3 (CH), 127.4 (C), 128.4 (CH), 128.6 (CH), 128.9 $(2 \times CH)$, 130.5 (CH), 136.8 (C), 140.7 (C), 141.9 (CH), 146.3 (C), 162.7 (C); EI MS m/z (%) 274 (M⁺⁺, 65), 168 (70), 128 (100), 101 (15), 82 (35), 77 (10), 47 (5); HRMS (EI) 274.1105 $(C_{18}H_{14}N_2O$ requires 274.1106).

2-Cyano-4-methoxy-pyridine (29c). Adapting the method of Fife,^{28a} Me₃SiCN (1.55 mL, 1.15 g, 11.7 mmol, 1.25 equiv.) was added to a solution of 4-methoxypyridine-N-oxide (1.17 g, 9.36 mmol, 1.0 equiv.) in CH_2Cl_2 (100 mL) at room temperature. A solution of dimethylcarbamoyl chloride (0.73 mL, 1.26 g, 11.7 mmol, 1.25 equiv.) in CH_2Cl_2 (20 mL) was then added dropwise over 30 min and the reaction mixture was stirred at room temperature for 6 days. Satd $Na₂CO₃$ (aq) (50 mL) was then added and the mixture was stirred for a further 10 min. The organic phase was then separated and the aqueous layer was extracted with CH_2Cl_2 (3 × 50 mL). The combined organic extracts were dried over $MgSO₄$ and the solvent was removed in vacuo to give the crude product, which was purified via column chromatography on silica gel (ethyl acetate) to give 29c (932 mg, 74%) as a pale yellow solid: mp 115–117 °C (CH2Cl2); IR (KBr) ν 1528, 1586, 1657 (aryl ring), 2888, 2929, 2954 (CH₃), 2996 (Ar–H) cm^{−1}; ¹H NMR (400 MHz, CDCl₃) δ_H 3.84 (s, 3H), 6.93 (dd, $J = 5.6$, 2.4 Hz, 1H), 7.15 (d, $J = 2.4$ Hz, 1H), 8.44 (d, $J = 5.6$ Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ_c 56.2 (CH₃), 113.1 (CH), 115.8 (CH), 117.5 (C), 135.5 (C), 152.7 (CH), 166.3 (C); EI MS m/z (%) 134 (M⁺⁺, 100), 119 (5), 104 (50), 104 (50), 83 (20), 77 (25), 64 (10), 51 (10), 50 (9); HRMS (EI) 134.0479 ($C_7H_6N_2O$ requires 134.0480). 1-Amino-2-phenylpropan-2-ol $(31d)$.²⁹ Adapting the protocol of Fleming,¹⁶ Me₃SiCN (6.1 mL, 45.0 mmol, 1.1 equiv.) and anhydrous ZnI_2 (80 mg, 0.25 mmol, 0.6 mol%) were added to a Schlenk tube containing acetophenone 32a (4.85 mL, 41.6 mmol, 1.0 equiv.) and the mixture was stirred at 50 °C for 16 h. The neat reaction mixture was then diluted with THF (200 mL) and added *via* cannula to a suspension of $LiAlH₄$ (4.75 g, 125 mmol, 3.0 equiv.) in THF (200 mL). After heating at reflux for 3 h the reaction was quenched with $Na₂SO₄$:10H₂O and filtered through a pad of celite (eluting with ether). Concentration of the filtrate in vacuo afforded 31d (3.90 g, 62%) as a clear oil: ¹H NMR (400 MHz, CDCl₃) δ _H 1.34 (s, 3H), 2.65 $(d, J = 12.8 \text{ Hz}, 1\text{H})$, 2.95 $(d, J = 12.8 \text{ Hz}, 1\text{H})$, 7.25–7.29 (m, 1H), 7.34 (t, $J = 8.0$ Hz, 2H), 7.45 (d, $J = 8.0$ Hz, 2H); ¹³C NMR (100 MHz, CDCl₃) δ_c 27.8 (CH₃), 52.7 (CH₂), 73.4 (C), 125.1 (2 × CH), 126.7 (CH), 128.2 (2 × CH), 146.5 (C); CI MS m/z (%) 152 ($[M + H]$ ⁺, 100), 134 (64), 121 (11), 97 (4), 71 (7); HRMS (CI) 152.1078 (C₉H₁₄NO requires 152.1075), in agreement with the literature.²⁹

Resolution

The resolution of 31d was carried out by recrystallising racemic 31d (3.90 g, 25.8 mmol, 1.0 equiv.) and (+)-mandelic acid (3.93 g, 25.8 mmol, 1.0 equiv.) from hot ethanol three times. The resultant salt was then basified with 2 M NaOH (30 mL) and extracted with ether $(2 \times 30 \text{ mL})$, dried over MgSO₄ and concentrated in vacuo to give (−)-31d (688 mg, 35%): $[\alpha]_D$ –13.6 (c 1.2, CHCl₃).

GC analysis

A portion of $(-)$ -31d (50 mg) in CH₂Cl₂ (1 mL) was treated with TFAA (1 mL) and stirred for 30 min. After concentration in vacuo the crude residue was passed through a plug column of silica gel (ethyl acetate) to provide a chiral GC sample: Chiral GC (β-DEXTM); carrier gas, He (flow 2 mL min⁻¹); injection temp, 200 °C; column temp: initial temperature, 80 °C; rate, 1.5 °C min⁻¹; final temperature, 200 °C, $t_{(+)}$ 48.62 min, $t_{(-)}$ 48.72 min, showed 92% ee.

2-Amino-1-(4′-trifluoromethylphenyl)-ethanol (31e). Adapting the protocol of Fleming, 16 Me₃SiCN (1.37 mL, 10.3 mmol, 1.4 equiv.) and anhydrous $ZnI₂$ (15 mg, 0.05 mmol, 0.6 mol%) were added to a Schlenk tube containing 4-trifluomethyl benzaldehyde (1.0 mL, 7.33 mmol, 1.0 equiv.) and the mixture was stirred at 50 °C for 16 h. The neat reaction mixture was then diluted with THF (150 mL) and added via cannula to a suspension of $LiAlH₄$ (1.66 g, 43.8 mmol, 3.0 equiv.) in THF (100 mL). After heating at reflux for 4 h the reaction was quenched with $Na₂SO₄·10H₂O$ and the mixture was filtered through a pad of Celite (eluting with ether). Concentration in vacuo afforded 31e (1.32 g, 88%) as a yellow solid: mp 70–72 °C; IR ν (KBr) 1330 (C–O), 2923 (CH–CH₂), 3095 (Ar–H) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ _H 2.53 (bs, 3H), 2.66–2.71 (m, 1H), 2.89–2.92 (m, 1H), 4.61 (dd, $J = 7.6$, 3.6 Hz, 1H), 7.37 (d, $J = 8.0$ Hz, 2H), 7.51 (d, $J = 8.0$ Hz, 2H); ¹³C NMR (100 MHz, CDCl₃) δ_C 48.0 (CH₂), 72.2 (CH), 123.1 $(q, {}^{1}J_{CF} = 270 \text{ Hz}, [\text{CF}_3])$, 124.4 (2 × CH), 125.1 (2 × CH), 128.7 (q, $^2J_{CF}$ = 32 Hz, [C]), 145.6 (C); CI MS m/z (%) 206 $([M + H]⁺, 100), 188 (10), 121 (1) 71 (2); HRMS (CI) 206.0791$ $(C_9H_{11}F_3NO$ requires 206.0793).

1-Amino-3,3-dimethylbutan-2-ol $(31f).^{30}$ Adapting the protocol of Fleming,¹⁶ Me₃SiCN (4.33 mL, 32.5 mmol, 1.4 equiv.) and anhydrous $ZnI₂$ (40 mg, 0.125 mmol, 0.5 mol%) were added to a Schlenk tube containing pivaldehyde (2.57 mL, 23.2 mmol, 1.0 equiv.) and the reaction mixture was stirred at 50 °C for 16 h. The neat reaction mixture was then diluted with THF (250 mL) and added *via* cannula to a suspension of $LiAlH₄$ (2.66 g, 70.0 mmol, 3.0 equiv.) in THF (150 mL). After heating at reflux for 3 h, the reaction was quenched with $Na₂SO₄$:10H₂O and the mixture was filtered through a pad of Celite (eluting with ether). The filtrate was concentrated by evaporation in vacuo to afford 31f (2.23g, 82%) as a yellow solid: mp 55–57 \degree C (CH_2Cl_2) ; IR (KBr) v 2956 (CH–CH₂–CH₃), 3281 (N–H) cm⁻¹;

Di[1-(2'-methoxyphenyl)-ethyl]ether (47). Obtained from the reduction of 1f (Table 3, entry 9) as a 55 : 45 mixture of diastereoisomers by elution from silica gel as a less polar fraction than the main product using a petroleum ether–AcOEt mixture (20 : 1): colourless oil; ¹H-NMR (400 MHz, CDCl₃) $\delta_{\rm H}$ 1.30 (*m*, d, $J = 6.4$ Hz, 6H, 2Me), 1.34 (*M*, d, $J = 6.4$ Hz, 6H, 2Me), 3.64 (m, s, 6H, 2OMe), 3.67 (M, s, 6H, 2OMe), 4.10 (m, q, $J = 6.4$ Hz, 2H, 2CH), 4.16 (*M*, q, $J = 6.4$ Hz, 2H, 2CH), 6.71 $(M, d, J = 8.4 \text{ Hz}, 2\text{H}), 6.76 \text{ } (m, d, J = 8.0 \text{ Hz}, 2\text{H}), 6.82 \text{ } (M, t, J)$ $J = 7.6, 2H$, 6.96 (*m*, t, $J = 7.2, 2H$), 7.10 (*M*, td, $J = 8.0, 1.6$ Hz, 2H), 7.17 (*m*, td, $J = 8.0$, 1.6 Hz, 2H), 7.39 (*M*, dd, $J = 7.6$, 1.6 Hz, 2H), 7.50 (m, dd, $J = 7.2$, 1.6 Hz, 2H); ¹³C NMR (100 MHz, CDCl₃) δ _C 22.8 (2 × CH₃), 25.4 (CH), 45.5 (CH₂), 65.4 (CH), 79.7 (CH₂), 123.9 (CH), 125.4 (CH), 136.6 (CH), 149.7 (CH), 162.5 (C), 165.1 (C); IR (CHCl₃) ν 1216 (C–O), 3019 (Aryl C–H) cm⁻¹; EI MS m/z (%) 286 (M⁺⁺, 6), 271 (4), 178 (4), 151 (6) 135 (100), 105 (13), 84 (9), 49 (11); HRMS (EI) 286.1569 ($C_{18}H_{22}O_3$ requires 286.1568).

Di(1-phenyl-1-buten-3-yl)ether (48).³⁵ Obtained from the reduction of 1m (Table 3, entry 13) as a 1 : 1 mixture of diastereoisomers by elution from silica gel as a less polar fraction than the main product using a petroleum ether–AcOEt mixture $(75:1)$: ¹H-NMR (400 MHz, CDCl₃) $\delta_{\rm H}$ 1.26 and 1.28 (2 × d, $J = 6.4$ Hz, 2×6 H, 2×2 Me), 4.10 and 4.16 ($2 \times m$, 2×2 H, $2 \times 2CH_3CH$, 6.04 and 6.11 ($2 \times$ dd, $2 \times J = 16.0$, 7.6 Hz, $2 \times 2H$, $2 \times 2CHCH =$), 6.42 and 6.46 ($2 \times d$, $2 \times J = 16.0$ Hz, $2 \times 2H$, $2 \times 2PhCH =$), 7.12–7.36 (m, $2 \times 10H$, $2 \times 2Ph$) in agreement with literature data.³⁵

Acknowledgements

We thank the EPSRC for grant No. GR/S87294/01, GSK and EPSRC for an industrial CASE awards to A. J. P. S. L., the Ministry of Education and Science of Spain for a fellowship to P. R.-L., the Loughborough University, the University of Glasgow and Dr Alfred Bader for additional support. We acknowledge COST-ORCA action (CM0905) for creating networking and exchange opportunities.

- 23 Note that hydrochloric acid, which is always present in trace amounts in commercial trichlorosilane due to partial hydrolysis, appears to play a crucial role in the catalytic process since in the presence of 1,8-bis- (dimethylamino)-naphthalene and related bases the reaction completely shuts down.
