3-Benzyl-3-azabicyclo[3.1.1]heptan-6-one: A Promising Building Block for Medicinal Chemistry

Page 4372. The first experimental procedure in the Supporting Information contains an ambiguity, which can be interpreted in different ways:

Supporting Information, page 2:

“A mixture of cyclobutanone (35.0 g, 0.50 mol), *N,N*-bis(methoxymethyl)benzylamine (97.5 g, 0.50 mol), and chlorotrimethylsilane (120.0 g, 1.10 mol) was added dropwise to acetonitrile (2500 mL) upon stirring at 40 °C during 3 h.”

From the above given sentence, it is not clear whether the mixture of all components should be added together OR a mixture of cyclobutanone, *N,N*-bis(methoxymethyl)benzylamine and separately chlorotrimethylsilane must be added. In this context, this sentence should be replaced by the following sentence:

“A mixture of cyclobutanone (35.0 g, 0.50 mol), *N,N*-bis(methoxymethyl)benzylamine (97.5 g, 0.50 mol) (dropping funnel 1), and chlorotrimethylsilane (120.0 g, 1.10 mol) (dropping funnel 2) were added dropwise to acetonitrile (2500 mL) upon stirring at 40 °C during 3 h.”

A revised Supporting Information file has been submitted.
