2,2-Di(3-butynyl)malononitrile 1. A suspension of 0.5 g (16.6 mmol) of NaH (80%, dispersion in mineral oil) was washed two times with 10 mL of dry THF. Then, a solution of malononitrile (0.5 g, 7.6 mmol) in dry THF (15 mL) was added with concomitant evolution of hydrogen. Once the gas evolution was ceased, a solution of tosylate of 3-butyn-1-ol (4.24 g, 18.9 mmol, 2.5 eq) and NaI (2.84 g, 18.9 mmol, 2.5 eq) in THF (15 mL) was added and the resulting mixture was refluxed for 4 h. After reaching r.t., an aqueous solution of Na₂CO₃ (30 mL) was added and extracted with ether (3 x 30 mL). The organic layer was washed with brine, dried over anhydrous Na₂SO₄ and concentrated to dryness. The residue was purified by flash chromatography on silica gel with a mixture of hexane/EtOAc 90:10 as eluent. Two products were isolated: dialkylated malononitrile **1** (0.604 g, 47%, *R_f* = 0.32, hexane/EtOAc 80:20) and monoalkylated malononitrile (0.42 g, 47%, *R_f* = 0.35, hexane/EtOAc 80:20).

An independent alkylation of the monoalkylated malononitrile (0.57 g, 4.90 mmol) was performed under similar conditions: NaH, 0.33 g (7.65 mmol), tosylate 1.71 g (7.65 mmol), NaI 1.14 g (7.65 mmol) in THF (20 mL) gave **1** in 66% yield.

2,2-Di(4-pentynyl)malononitrile 2. To a solution of malononitrile (0.77 g, 11.7 mmol) and the tosylate of 4-pentyn-1-ol (6.14 g, 25.7 mmol) in dry DMF (6 mL) was added DBU (3.85 mL, 25.8 mmol). The reaction mixture was refluxed for 5 h and, once cooled to r.t., the mixture was poured into H₂O (10 mL) and extracted with CH₂Cl₂ (3 x 20 mL). The organic layer was washed with an aqueous solution of HCl 5N (3 x 20 mL) and brine, dried over anhydrous Na₂SO₄ and concentrated to dryness. The residue was purified by flash chromatography on silica gel with a mixture of hexane/EtOAc 80:20 as eluent giving malononitrile **2** (2.22 g, 95%) as a yellow oil.

CpCo(COD)-catalyzed [2+2+2] cycloaddition between *bis*-alkynenitrile **1 and acetylene (**3a**).**

A solution of **1** (0.6 g, 3.52 mmol) and CpCo(COD) (0.245 g, 1.05 mmol, 30%) in toluene (50 mL) is introduced in a Parr reactor and filled with acetylene until 2.3 Bar. Then the reactor is heated at 137 °C overnight (the internal pressure is raised to 9 Bar). Once the reactor reaches room temperature and the gas pressure is released, the volatiles were removed under vacuum and the residue was chromatographed on neutral alumina (activity IV) using a mixture of hexane/EtOAc 8:2 as eluent. Two products were obtained in order of elution: 0.15 g of pyridine **6** (14%, $R_f=0.87$, EtOAc/MeOH 95:5) and 0.25 g of spiro pyridine **4a** (32%, $R_f=0.25$ (EtOAc/MeOH 95:5)).

Other experiments using the same amounts of **1** but higher or lower acetylene pressure (5 or 1.2 Bar) gave poorer results: **4a**, 20 % and 14%, respectively.

CpCo(C₂H₄)₂-catalyzed [2+2+2] cycloaddition between *bis*-alkynenitrile **1 and acetylene (**3a**).**

A solution of **1** (0.1 g, 0.58 mmol) in toluene (7 mL) is placed in a purged Schlenk at -20 °C and then acetylene (**3a**) was bubbled for 30 min. Then, a solution of CpCo(C₂H₄)₂ (0.031 g, 0.17 mmol, 30%) in toluene (2 mL) at -20 °C was cannulated into the flask. After stirring 45 min at this temperature (no conversion by tlc monitoring), the solution was allowed to reach rt and stirred for 4 h (an extra amount of catalyst, 0.2 mmol, was needed for completion). After workup as above two products were isolated: **4a** (27 mg, 21%) and **6** (19 mg, 11%).

A variation of experimental conditions, bubbling acetylene after having added the catalyst to the solution of **1**, gave poorer results.

General procedure for the CpCo(CO)₂-catalyzed [2+2+2] cycloaddition between *bis*-alkynenitriles and alkynes

A solution of *bis*-alkynenitrile (**1** or **2**, 0.1 g, 1 equiv), **3** (see each case below) and [CpCo(CO)₂] (30%) in toluene (10 mL) was irradiated for several hours under Ar in a round-bottomed flask equipped with a reflux condenser. The reaction vessel was irradiated with a Philips PF 808 300W tungsten slide projector lamp placed ca. 5 cm from the center of the flask and operated at 225 W. The volatile components were removed under vacuum and the residue was chromatographed on silica gel.
