General. Melting points were determined in capillaries and are uncorrected. ^1H and ^{13}C NMR spectra were recorded on a Varian UNITY PLUS 400 (93.94 kG, ^1H 400 MHz, ^{13}C 100 MHz), and a Varian Gemini 300 (70.5 kG, ^1H 300 MHz, ^{13}C 75 MHz) as indicated in CDCl_3 (0.5 mL) or $\text{DMSO}-d_6$ (0.5 mL). The δ 7.24 resonance of residual CHCl_3 , and the center line of the $^{13}\text{CDCl}_3$ triplet (δ 77.0) were used as internal references for the ^1H and ^{13}C spectra, respectively, for spectra in CDCl_3 . For $\text{DMSO}-d_6$, the δ 2.49 resonance of residual $\text{DMSO}-d_5$, and the center line of the $^{13}\text{CD}_3\text{S}(\text{O})\text{CD}_3$ septet (δ 39.51) were used as internal references for the ^1H and ^{13}C spectra, respectively, for spectra in $\text{DMSO}-d_6$. All exchangeable proton resonances (OH) were identified by the addition of D_2O . Relative intensities of carbon resonances were determined by integration of spectra recorded under inverse gated decoupling ($D_1 = 10$ s). Carbon chemical shifts are reported to a single decimal place with the exception of resolved resonances which can be distinguished numerically only to the second decimal position. Infrared spectra were recorded on a Perkin-Elmer 1800 spectrophotometer. Only diagnostic bands such as carbonyl and hydroxy bond stretching bands, are reported. Mass spectra were measured on a Finnigan MAT-90 spectrometer as indicated.

General procedure for thermal Diels-Alder cycloadditions of 1a - e and 2b with symmetric maleates. The respective anthracenes (1 eq) and dienophiles (1.2 eq) were refluxed in benzene (9 hr) or toluene (18 hr) as indicated in Table 1. For the cycloadditions indicated in Table 3, bromomaleic anhydride (1.1 eq) and citraconic anhydride (4 eq) were refluxed in toluene for 6-9 hr and 48 hr, respectively. After cooling to rt, the solvent was removed in vacuo to obtain crude products, which were analyzed by ¹H NMR for diastereoselectivity. The crude products were then dissolved in a minimum amount of CH₂Cl₂ and precipitated with hexanes to afford pure products.

General procedure for Lewis acid catalyzed Diels-Alder cycloadditions:

Cycloadditions of 1b and 1e. Anhydrous CH₂Cl₂ (3 - 4 mL) was added to a mixture of N, N'-dibenzylideneethylenediamine (0.275 mmol, 1.1 eq) and copper (II) triflate (0.25 mmol, 1.0 eq) in a dry conical flask equipped with a magnetic stirrer under argon. The green solution thus obtained was stirred at rt for 2 hr after which maleic anhydride (1.2 eq) and the respective anthracene (1.0 eq) were added sequentially. After 48 hr at rt, the reaction was quenched by adding H₂O (5 mL). Stirring was continued until the CH₂Cl₂ layer turned yellow and the H₂O layer turned blue, then CH₂Cl₂ (5 mL) was added and the layers were separated. The organic layer was extracted with H₂O (2 X 10 mL), then dried over Na₂SO₄, filtered, and then the solvent was removed in vacuo to afford crude product, which was analyzed by ¹H NMR for diastereoselectivity. The crude products were then dissolved in a minimum amount of CH₂Cl₂ and precipitated with hexanes to afford pure products.

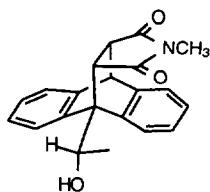

Cycloadditions of 2b. Anhydrous CH₂Cl₂ (3 - 4 mL) was added to a mixture of **2b** (1 eq) and NMM (1.5 eq) in a dry conical flask equipped with a magnetic stirrer under argon. The Lewis acid (1.1 eq) was added under the positive pressure of an argon filled balloon at 0 °C. The solution thus obtained was stirred at rt for 24 hr. The reaction was diluted with CH₂Cl₂ (5 mL) and quenched by adding H₂O (5 mL). The organic layer was extracted with H₂O (2 X 10 mL), then dried over Na₂SO₄, filtered, and then the solvent removed in vacuo to afford crude product, which was analyzed by ¹H NMR for diastereoselectivity. Pure products were purified by flash chromatography on silica gel eluting with EtOAc/hexanes (1/4).
