**UM624 Write-up**

A yellow crystalline block with dimensions 0.776 x 0.148 x 0.141 mm<sup>3</sup> was optically centered on the Bruker SMART CCD system at -80° C. The initial unit cell was indexed using a least-squares analysis of a random set of reflections collected from three series of 0.3° wide  $\omega$  scans (25 frames/series) that were well distributed in reciprocal space. Data frames were collected [MoK $\alpha$ ] with 0.3° wide  $\omega$ -scans, 60 seconds per frame, 700 frames per series. Six complete series were collected with an additional 160 frames with a repeat of the first series for redundancy and decay purposes. A crystal to detector distance of 8.962 cm was used, providing a complete sphere of data to  $2\theta_{\max} = 40^\circ$ . A total of 524613 reflections were collected and corrected for Lorentz and polarization effects and absorption using Blessing's method as incorporated into the program SADABS<sup>1,2</sup> with 88730 unique reflections [R(int)=0.1642].

**Structure Determination and Refinement.** Calculations were performed on a PC with dual Pentium 450 MHz processors and 384 MB of memory. The SHELXTL<sup>3</sup> program was used to determine the acentric orthorhombic space group P2<sub>1</sub>2<sub>1</sub>2<sub>1</sub> (no. 19), and apply the absorption correction. The structure was determined by Patterson interpretation using the program XS<sup>4</sup>. Refinement with XL<sup>5</sup> and XH<sup>5</sup> and subsequent difference-Fourier maps and refinement cycles revealed atom locations. Disorder was modeled in a variety of locations within the G-quadruplexes. Disorder was prevalent in the solvent. Many of the sidechain t-butyltrimethylsilyl groups required construction via a series of DFIX<sup>5</sup> commands. During convergence, lead, silicon and chlorine atoms were refined anisotropically while the remainder of the ensemble was refined isotropically. Reasons for not expanding the number of atoms refined anisotropically included the size of the complex and time required per refinement cycle. Due to the large number of variables, 4989, refinement was performed in two BLOCs<sup>5</sup>, in order to use a least-squares full-matrix approach on F<sup>2</sup>. The entire ensemble refined to convergence. This produced the residuals R(F)=16.19%, wR(F<sup>2</sup>)=24.35% and GOF=1.037 for 88730 unique reflections [R(F)=8.75%, wR(F<sup>2</sup>)=21.40% for those 54223 data with Fo > 4 $\sigma$ (Fo)]. A final difference-Fourier map possessed many background peaks, with one as large as  $|\Delta\rho| \leq 0.932 \text{ e}\text{\AA}^{-3}$ , indicating that the structure is correct and complete. The function minimized during the full-matrix least-squares refinement was  $\sum w(F_o^2 - F_c^2)^2$  where  $w = 1/[\sigma^2(F_o^2) + (0.1412 * P)^2 + 0 * P]$  and  $P = (\max(F_o^2, 0) + 2 * F_c^2)/3$ . An empirical correction for extinction was applied to the data in the form  $(F_c^2, \text{corr}) = k[1 + 0.001 * x * F_c^2 * \lambda^3 / \sin(2\theta)]^{-1/4}$ , where k=0.05200 is the scale factor. The value determined for x was 0.011(4).

Symmetry transformations used to generate equivalent atoms:

#1 -x-1/2,-y+1,z+1/2 #2 -x-1/2,-y+1,z-1/2 #3 -x,y+1/2,-z+1/2

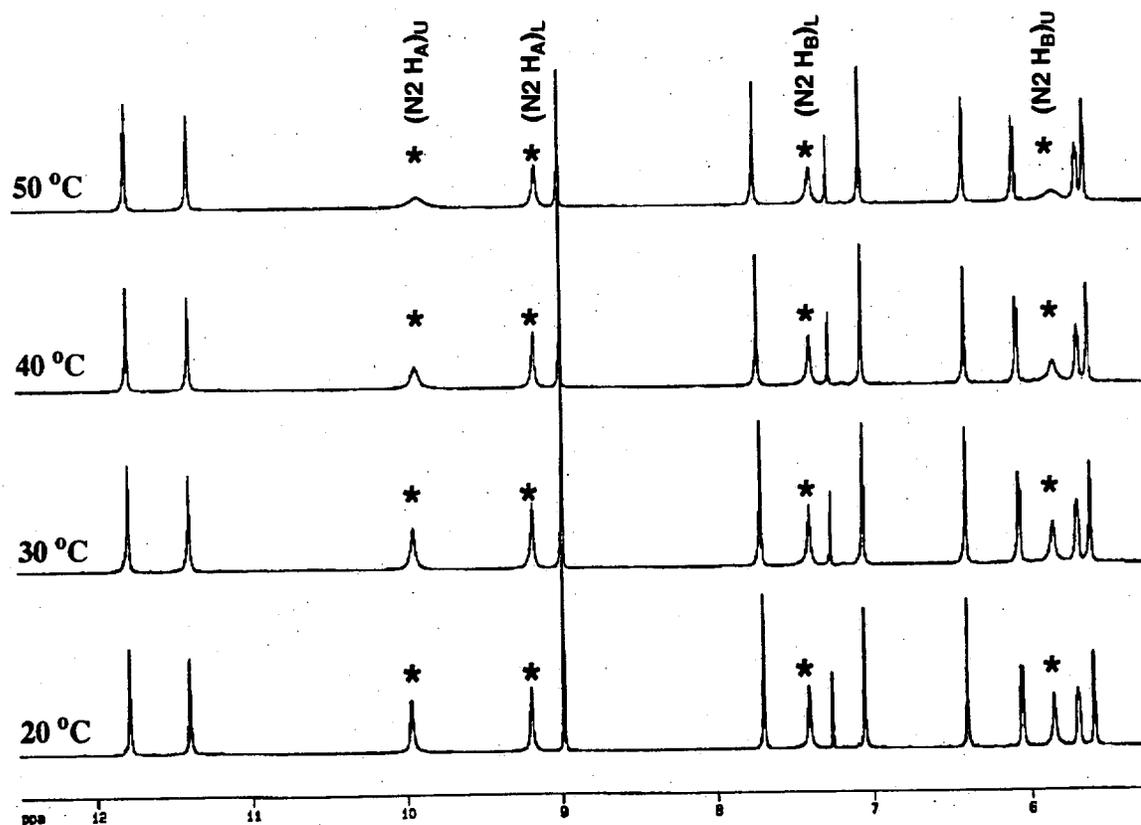

#4 -x,y-1/2,-z+1/2 #5 -x+1/2,-y+1,z+1/2 #6 -x+1/2,-y+1,z-1/2

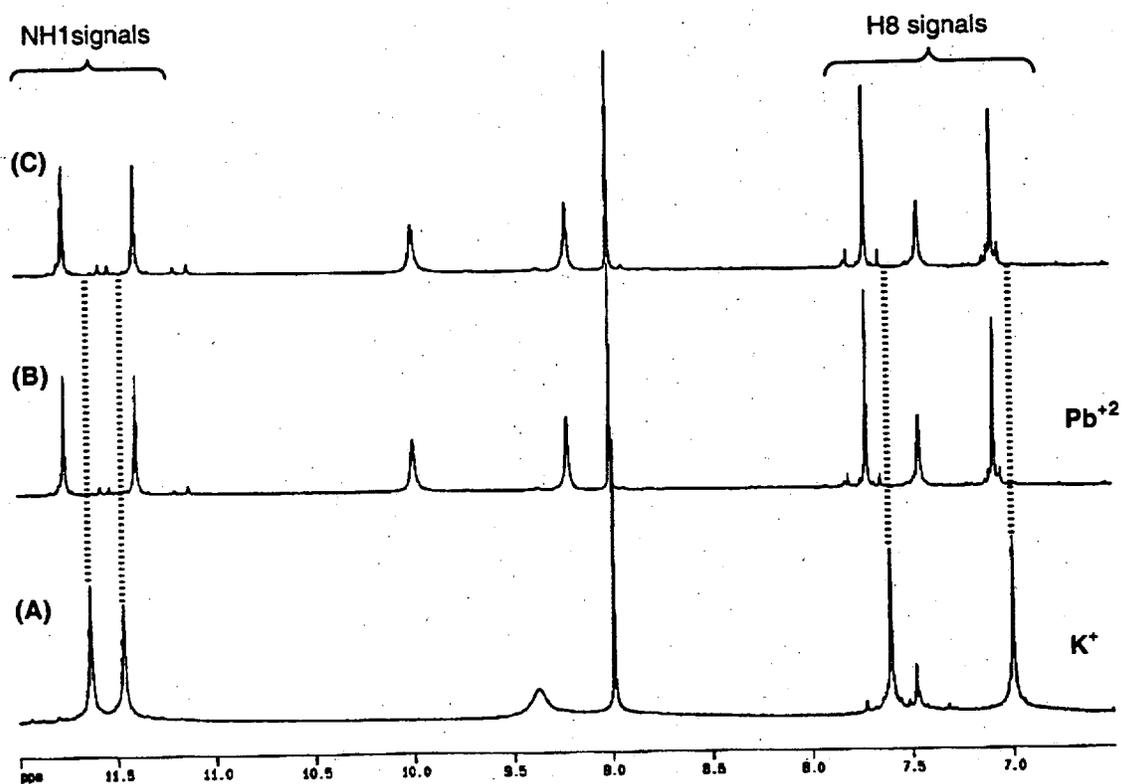

**Figure 1.** One dimensional  $^{207}\text{Pb}$  NMR. Spectra were recorded on a Bruker DRX 500 MHz spectrometer at 25 °C operating at 104.63 MHz for  $^{207}\text{Pb}$ . A total of 16,000 data points were collected with an acquisition time of 1.6 s for both experiments. A sweep width of 5 kHz was used. Fourier transformation was done with a line broadening of 3 Hz. (A) A 1.0 M solution of  $\text{Pb}(\text{NO}_3)_2$  in 99.9%  $\text{D}_2\text{O}$  at pH 3.3 was used as the external reference. Two transients were collected with a 2 s relaxation delay. The NMR signal at  $\delta = -2961$  ppm is relative to  $\text{Pb}(\text{CH}_3)_4$  at  $\delta = 0.0$  ppm. (B) The Pb octamer,  $(\text{G} 1)_8\text{-Pb}^{+2}(\text{pic})_2$ , in  $\text{CDCl}_3$ . The sample was 50 mM in octamer. A total of 1000 transients were collected with a 0.5 s relaxation delay.

**Figure 2A. Schematic for identification of inequivalent G<sub>4</sub>-quartets.** From the crystal structure of (G 1)<sub>8</sub>-Pb<sup>+2</sup>(pic)<sub>2</sub>, it is apparent that the N2 H<sub>B</sub> protons of one G<sub>4</sub>-quartet are hydrogen bonded to the 5'-oxygens of the other G<sub>4</sub>-quartet. The G<sub>4</sub>-quartet containing the N2 H<sub>B</sub> protons (hydrogen bond donors) is arbitrarily defined as the upper quartet (G<sub>4</sub>-U). Conversely, the quartet containing the hydrogen bonding acceptor 5'-oxygens is defined as the lower quartet (G<sub>4</sub>-L).

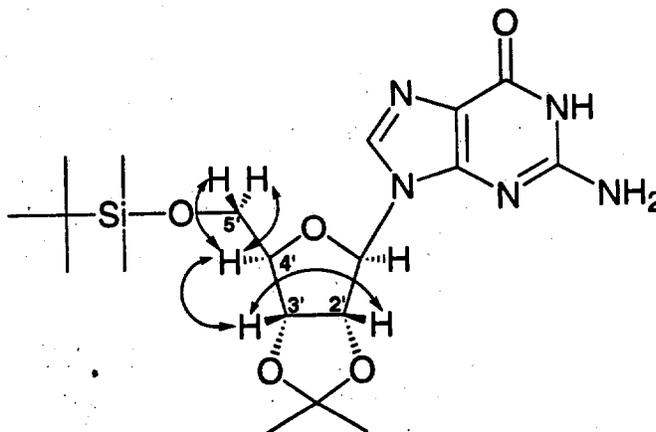

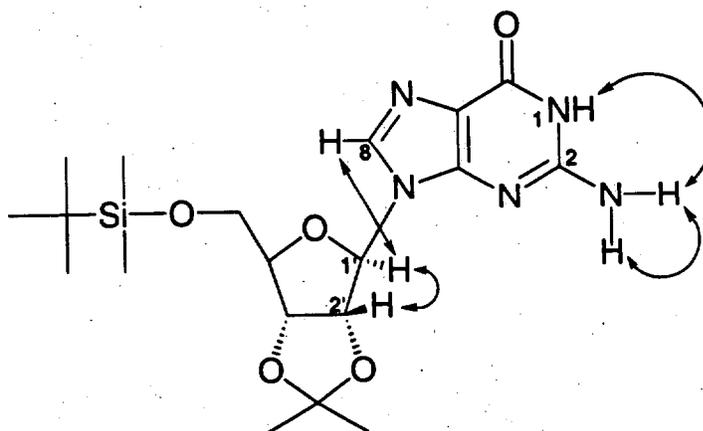

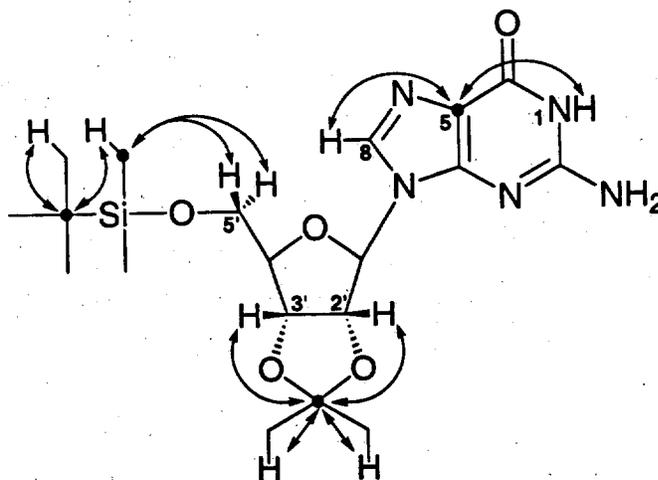

**Figure 2B. Temperature-dependent <sup>1</sup>H NMR spectra of (G 1)<sub>8</sub>-Pb<sup>+2</sup>(pic)<sub>2</sub>.** A series of one dimensional spectra were recorded in CDCl<sub>3</sub> at temperatures between 20 - 50 °C. The two sets of amino protons, N2 H<sub>A</sub> and N2 H<sub>B</sub> for both upper and lower G<sub>4</sub>-quartets, are labeled with asterisks. Separate signals for these four amino protons are observed over this temperature range, indicating relatively slow C2-N2 bond rotation on the NMR chemical shift timescale.

**Figure 3. Extraction selectivity of  $\text{Pb}^{2+}$  vs.  $\text{K}^+$ .** Spectra were recorded at 25 °C in  $\text{CD}_2\text{Cl}_2$ . (A)  $(\text{G } 1)_8\text{-K}^+(\text{pic})$ . (B)  $(\text{G } 1)_8\text{-Pb}^{2+}(\text{pic})_2$ . (C) the  $(\text{G } 1)_8\text{-Pb}^{2+}(\text{pic})_2$  complex formed after extraction of salt from an aqueous phase containing 1 equiv of  $\text{PbCl}_2$  and 10 equiv of  $\text{K}^+$  picrate. The dashed lines in the  $^1\text{H}$  NMR spectrum indicate that no  $\text{K}^+$ , and only  $\text{Pb}^{2+}$ , was extracted from this mixture. See the experimental section for the details of the extraction procedure.

 $^1\text{H}$ - $^1\text{H}$  COSY $^1\text{H}$ - $^1\text{H}$  NOESY $^1\text{H}$ - $^{13}\text{C}$  HMBC

**Figure 4. Assignment Strategy for  $^1\text{H}$  and  $^{13}\text{C}$  NMR resonances.** The sugar protons (H2', 3', 4', 5', and 5'') were assigned to their respective G<sub>4</sub>-quartets based on a  $^1\text{H}$ - $^1\text{H}$  COSY experiment. A  $^1\text{H}$ - $^1\text{H}$  NOESY allowed for correlation of H2'-H1', H1'-H8, and NH1 amide-N2 H<sub>A</sub> and H<sub>B</sub> amino protons. The carbon assignments were based on  $^1\text{H}$ - $^{13}\text{C}$  HMQC and HMBC experiments. The HMBC experiment allowed for the correlations between C5-H8 and C5-NH1, as well as for the *t*-butyl-dimethylsilyl side chain and the isopropylidene. Arrows show key correlations obtained from the COSY, NOESY, and HMBC experiments.

Si-t-Bu-Me's	25.9	25.5	
Picrate			161.9, 141.6
			126.9, 126.7

Tables.  $^1\text{H}$  and  $^{13}\text{C}$  NMR assignments for  $(G\ 1)_8\text{-Pb}^{+2}(\text{pic})_2$ . Assignments were based following the strategy described in Figure 4 of the Supporting Information.. Spectra were recorded at 25 °C in  $\text{CDCl}_3$ . The abbreviations are:  $G_4\text{-U}$  = upper  $G_4$ -quartet,  $G_4\text{-L}$  = lower  $G_4$ -quartet, iP = isopropylidene, Bu = butyl, Me = methyl, quat = quaternary.
