Aloe species, native to Africa and Arabia, have been used traditionally by local inhabitants as medicinal plants, as well as a source of arrow poison. Phytochemical investigation of Aloe sabaea, a representative of the Aloeaceae family, has revealed the presence of a chlorinated amide, namely N-(4-chlorobutyl)butanamide (10). This was the first report of the occurrence of a chlorinated compound in this family. Despite the simple structure of this natural product, no synthesis has been reported. Since halogenated compounds occur in marine organisms, algae, lichens and even in higher plants, the preparation of such types of compounds is of current scientific interest. Therefore, the present report describes a short and efficient synthesis of N-(4-chlorobutyl)butanamide (10).

Two possible strategies can be suggested, the first consisting in the alkylation of butanamide with a ω , ω' -chlorohalobutane and the second in the condensation of butyryl chloride and 4-chlorobutylamine. Several attempts to alkylate butanamide with 1-bromo-4-chlorobutane using a variety of bases such as sodium hydride, lithium diisopropylamide and n-butyllithium in tetrahydrofuran at room temperature or reflux, sometimes in the presence of HMPA, were unsuccessful and the starting materials were recovered. The major difficulty of the second approach is the use of a 4-halobutylamine, since the free amine can undergo cyclization to pyrrolidine or can give rise to cross-linked products. Since an efficient procedure for the synthesis of 4-bromobutylamine hydrobromide (8) had been described,⁵ two different routes were thus evaluated for the synthesis of the adequate precursor of 8, namely 4-phenoxybutylamine (6) (*Scheme 1*). In the first procedure, 1,4-dibromobutane (3) was converted into 1-bromo-4-phenoxybutane (4) by reaction with sodium phenoxide in water. Treatment of 4 with sodium azide in DMSO at 50°C afforded 4-phenoxybutyl azide (5) in quantitative yield. Reduction of 5 with SnCl₂ in HCl-satu-

nitrile 2 in 95% yield. Reduction of the cyano group of 2 with LiAlH₄ in the presence of AlCl₃ afforded 4-phenoxybutylamine (6) in an overall yield of 73%. The desired 4-bromobutylamine hydrobromide (8) was then prepared by reaction of 4-phenoxybutylamine (6) with 48% aqueous HBr solution at reflux for 6 hrs. This modified procedure, adapted from Brown and van Gulick,⁵ constitutes an improvement of both the experimental handling as well as the yield. When a similar procedure was applied using concentrated HCl instead of HBr, only the hydrochloride salt of 4-phenoxybutylamine (7) was formed. This implied that a bromide/chloride exchange would be necessary in a final stage, since the chlorinated analogue of amine 8 could not be prepared this way.

The synthesis of N-(4-bromobutyl)butanamide (9) was performed by coupling of butyryl chloride with 4-bromobutylamine hydrobromide (8) in the presence of Et_3N (*Scheme 1*). To accomplish the natural product synthesis, triethylamine hydrochloride was used for the necessary bromide/chloride substitution, resulting in N-(4-chlorobutyl)butanamide (10) and 1-butyrylpyrrolidine (11) as a side-product. This substituted pyrrolidine 11 has been reported as a major compound identified from pyrolyzed proline Amadori and proline/glucose mixtures, $^{8.9}$ and

SYNTHESIS OF N-(4-CHLOROBUTYL)BUTANAMIDE, A CHLORINATED AMIDE

as a compound in the volatile oil of *Rhododendron* from Sichuan Liangshan.¹⁰ It was observed that the amount of 1-butyrylpyrrolidine (11) increased upon prolonged reaction times. After 36 hrs, a ratio of 81/19 (10/11) was found, whereas a ratio of 75/25 was found after 60 hrs heating, as determined by GC-MS analysis. Purification of *N*-(4-chlorobutyl)butanamide (10) was performed by means of flash chromatography. Based on the spectral data of the synthesized compound and that of the natural product isolated from *Aloe sabaea*,³ both compounds were judged to be chemically identical, apart from some minor shifts in ppm values due to the use of different deuterated solvents.

In conclusion, the first synthesis of the naturally occurring N-(4-chlorobutyl)butanamide (10), isolated from *Aloe sabaea*, was developed in an overall yield of 45%.

EXPERIMENTAL SECTION

¹H NMR spectra were recorded at 60 MHz (JEOL PMX 60SI) or at 270 MHz (JEOL JNM-EX 270) with CDCl₃ as solvent and tetramethylsilane as internal standard, or D₂O as a solvent and CH₃CN as reference. ¹³C NMR spectra were recorded at 67.8 MHz (JEOL JNM-EX 270) with CDCl₃ or D₂O as solvent. Mass spectra were obtained with a mass spectrometer (VARIAN MAT 112, 70 eV) using a GC-MS coupling (RSL 200, 20 m glass capillary column, i.d. 0.53 mm, He carrier gas) or a Hewlett-Packard 6890 GC Plus coupled with a HP 5973 mass selective detector (MSD, quadrupole type, 70 eV), equipped with a CIS-4 programmed temperature vaporization (PTV) injector (Gerstel), and a HP5-MS capillary column (30 x 0.25 mm i.d., coating thickness: 0.25μm). Compound purity was assessed by this method. IR spectra were measured with a Perkin Elmer 210 spectrophotometer or a Spectrum One FT-IR. Dichloromethane was dried over calcium hydride. Methanol was dried by distillation over magnesium, while diethyl ether was dried by distillation over sodium benzophenone ketyl. Other solvents were used as received from the supplier.

4-Phenoxybutyl Azide (5).- Although two references dealing with 4-phenoxybutyl azide (5) could be found, 11,12 no spectral data have been published. To a solution of commercially available 1-bromo-4-phenoxybutane (4) (11.45 g, 50 mmol), prepared from 1,4-dibromobutane (3) and aqueous sodium phenoxide in DMSO (100 mL), was added NaN₃ (4.88 g, 1.50 equiv.) in small portions. The suspension was heated at 50°C for 1.5 hrs behind a safety screen. The reaction mixture was then poured into ice-water and extracted with Et_2O (3 x 25 mL). The combined organic extracts were washed with water (1 x 25 mL) and dried (MgSO₄). After removal of the drying agent and evaporation of the solvent (in tap-water cooled water bath), 4-phenoxybutyl azide (5) (9.31 g, 98%) was isolated as a yellow liquid. The crude product was used as such in the next step (purity > 95% as determined by GC).

¹**H NMR** (60 MHz, CDCl₃): δ 1.60-1.90 (m, 4H, CH₂(CH₂)₂CH₂), 3.33 (t, J = 6.4 Hz, 2H, CH₂N₃), 3.96 (t, J = 6.4 Hz, 2H, CH₂OC₆H₅), 6.80-7.50 (m, 5H, OC₆H₅). ¹³**C NMR** (67.8 MHz, CDCl₃): δ 25.8 and 26.5 (CH₂(CH₂)₂CH₂), 51.2 (CH₂N₃), 67.0 (CH₂OC₆H₅), 114.5 (2 x HC_{ortho}), 120.7 (HC_{para}), 129.5 (2 x HC_{meta}), 158.9 (C-O). **IR** (NaCl, cm⁻¹): v = 2090 (N₃).

D'HOOGHE, SZAKONYI, FÜLÖP AND DE KIMPE

4-Phenoxybutylamine (6). *Procedure 1.*- To a solution of stannous chloride (43.92 g, 1.77 equiv.) in HCl-saturated MeOH (400 mL), was added dropwise at 0°C a solution of 4-phenoxybutyl azide (5) (29.50 g, 155 mmol) in MeOH (100 mL). After stirring for 2 hrs at room temperature, the reaction mixture was evaporated and aqueous NaOH (300 mL, 2.5M) was added to the solid residue. Extraction with CH₂Cl₂ (4 x 200 mL), drying (MgSO₄), filtration and evaporation of the solvent *in vacuo* yielded 4-phenoxybutylamine (6) (15.41 g, 60%) as a yellow liquid.⁶ *Procedure 2.*- To a suspension of LiAlH₄ (1.36 g, 2.10 equiv.) and dry Et₂O (40 mL) was added dropwise at room temperature a solution of AlCl₃ (3.87 g, 1.70 equiv.) in dry Et₂O (40 mL). After 5 minutes, a mixture of 4-phenoxybutanenitrile (2)¹³⁻¹⁵ (2.75 g, 17 mmol), prepared from 1-

dropwise at room temperature a solution of AlCl₃ (3.87 g, 1.70 equiv.) in dry Et₂O (40 mL). After 5 minutes, a mixture of 4-phenoxybutanenitrile (2)¹³⁻¹⁵ (2.75 g, 17 mmol), prepared from 1-bromo-3-phenoxypropane (1), in dry Et₂O (10 mL) was added. This mixture was heated for 4 hrs under reflux, cooled to 0°C, and neutralized with a solution of 20 mL of 20% NaOH and 30 mL benzene. The solid material was filtered off and washed with benzene (5 x 25 mL). The filtrate was extracted with HCl (30 mL, 6M in H₂O). The aqueous phase was made alkaline with NH₄OH (25% in water) and extracted with benzene (3 x 25 mL) (the extraction was performed in a well-ventilated hood). The combined organic extracts were dried (MgSO₄), and after filtration and removal of the solvent *in vacuo*, 4-phenoxybutylamine (6) (2.17 g, 77%) was isolated as a yellow liquid. The product appears to be unstable in contact with air, and was therefore used as such in the next step (purity > 95% as determined by GC). Although compound 6 is known in literature, ¹⁶⁻¹⁹ no spectral characterization has been reported.

¹H NMR (270 MHz, CDCl₃): δ 1.33 (br s, 2H, NH₂), 1.55-1.66 and 1.76-1.86 (2 x m, 4H, CH₂(CH₂)₂CH₂), 2.75 (t, J = 6.93 Hz, 2H, CH₂NH₂), 3.96 (t, J = 6.44 Hz, 2H, CH₂OC₆H₅), 6.87-6.95 (m, 3H, 2 x HC_{ortho} and HC_{para}), 7.24-7.35 (m, 2H, 2 x HC_{meta}). ¹³C NMR (67.8 MHz, CDCl₃): δ 26.68 and 30.35 (CH₂(CH₂)₂CH₂), 41.94 (CH₂NH₂), 67.56 (CH₂OC₆H₅), 114.45 (2 x HC_{ortho}), 120.54 (HC_{para}), 129.41 (2 x HC_{meta}), 158.97 (CO). **IR** (NaCl, cm⁻¹): v = 3372 (NH₂). **MS** (70 eV): m/z (%): 165 (M⁺, 1), 94 (32), 86 (16), 84 (23), 77 (16), 72 (100), 65 (12), 55 (10), 43 (10).

4-Bromobutylamine Hydrobromide (8). ⁵- 4-Phenoxybutylamine (6) (29.00 g, 176 mmol) was dissolved in 48% aqueous HBr solution (200 mL, 10 equiv.) and refluxed for 6 hrs. Water was removed from the cooled reaction mixture at 11 mmHg, and the residue was finally dried at high vacuum (0.01 mmHg). The orange crystals were dissolved in hot acetone and precipitated by EtOAc. Filtration of the solid material, washing with diethyl ether and removal of the residual solvent *in vacuo* (0.01 mmHg) yielded 4-bromobutylamine hydrobromide (8) (33.61 g, 82%) as light orange crystals. Although this compound is known in the literature, ^{5,20-26} no spectral data had been reported.

¹H NMR (60 MHz, D₂O): δ 1.76-1.79 (m, 2H, CH₂CH₂NH₂), 1.85-1.88 (m, 2H, CH₂CH₂Br), 2.98 (br s, 2H, CH₂NH₂), 3.40-3.50 (m, 2H, CH₂Br). ¹³C NMR (67.8 MHz, D₂O): δ 25.8 (CH₂CH₂NH₂), 29.2 (CH₂CH₂Br), 34.0 (CH₂NH₂), 39.1 (CH₂Br). **IR** (NaCl, CDCl₃, cm⁻¹): $\nu = 3435$ (NH₃⁺).

SYNTHESIS OF N-(4-CHLOROBUTYL)BUTANAMIDE, A CHLORINATED AMIDE

N-(4-Bromobutyl)butanamide (9).- To an ice cooled solution of butyryl chloride (5.33 g, 50 mmol) and 4-bromobutylamine hydrobromide (8) (11.65 g, 1.00 equiv.) in CH_2Cl_2 (50 mL) was added Et_3N (12.65 g, 2.5 equiv.) dropwise and the solution was stirred for 30 minutes at 0°C. The reaction mixture was poured into water and extracted with CH_2Cl_2 (3 x 25 mL). Drying (MgSO₄), followed by filtration and evaporation of the solvent *in vacuo* afforded N-(4-bromobutyl)butanamide (9) which was purified by column chromatography (hexane/EtOAc 1/1), resulting in the pure compound as a light yellow oil (10.33 g, 93%).

¹H NMR (270 MHz, CDCl₃): δ 0.95 (t, J = 7.43 Hz, 3H, CH₃), 1.59-1.75 (m, 4H, CH₂CH₂NH and CH₃CH₂), 1.84-1.95 (m, 2H, CH₂CH₂Br), 2.16 (t, J = 7.43 Hz, 2H, CH₂CO), 3.29 (q, J = 6.71 Hz, 2H, CH₂NH), 3.44 (t, J = 6.60 Hz, 2H, CH₂Br), 5.75 (br s, 1H, NH). ¹³C NMR (67.8 MHz, CDCl₃): δ 13.78 (CH₃), 19.35 (CH₃CH₂), 28.18 (CH₂CH₂NH), 30.08 (CH₂CH₂Br), 33.42 (CH₂Br), 38.38 and 38.45 (CH₂CO and CH₂NH), 173.96 (CO). IR (NaCl, cm⁻¹): v = 3392 (NH), 1644 and 1551 (CONH). MS (70 eV): m/z (%): 221/3 (M⁺, 13), 206/8 (14), 193/5 (100), 142 (70), 135/7 (16), 128 (33), 114 (37), 100 (43), 72 (19), 71 (51), 55 (31), 43 (45). Light yellow oil, TLC Rf 0.24 (hexane/EtOAc 1/1).

Anal. Calcd for C₈H₁₆BrNO: C 43.26; H 7.26; N 6.31. Found: C 43.29; H 7.30; N 6.28

N-(4-Chlorobutyl)butanamide (10).- A mixture of N-(4-bromobutyl)butanamide (9) (5.55 g, 25 mmol) and Et₃N•HCl (34.42 g, 10.00 equiv.), dissolved in DMF (100 mL), was heated at 100°C for 36 hrs. The reaction mixture was poured into water, extracted with CH_2Cl_2 (3 x 25 mL), and the combined organic extracts were washed with water (3 x 50 mL). After drying (MgSO₄), removal of the drying agent and the solvent, a mixture of N-(4-chlorobutyl)butanamide (10)³ (81%) and 1-butyrylpyrrolidine (11) (19%) was obtained. The percentage of these compounds in the mixture was determined by GC-MS. Separation and purification was performed by means of column chromatography (hexane/EtOAc 1/1), resulting in the pure N-(4-chlorobutyl)butanamide (10) as a light yellow oil (3.27 g, 91%) and in 1-butyrylpyrrolidine (11) as a light yellow oil (0.57 g, 85%).

¹H NMR (270 MHz, CDCl₃): δ 0.95 (t, J = 7.26 Hz, 3H, CH₃), 1.59-1.73 (m, 4H, CH₂CH₂NH and CH₃CH₂), 1.76-1.86 (m, 2H, CH₂CH₂Cl), 2.16 (t, J = 7.43 Hz, 2H, CH₂CO), 3.29 (q, J = 6.49 Hz, 2H, CH₂NH), 3.56 (t, J = 6.27 Hz, 2H, CH₂Cl), 5.85 (br s, 1H, NH). ¹³C NMR (67.8 MHz, CDCl₃): δ 13.78 (CH₃), 19.34 (CH₃CH₂), 27.01 (CH₂CH₂NH), 29.94 (CH₂CH₂Cl), 38.47 and 38.58 (CH₂CO and CH₂NH), 44.69 (CH₂Cl), 173.78 (CO).
