### IODIDE SALTS OF NITROGEN HETEROCYCLES BY BROMIDE-IODIDE EXCHANGE

Submitted by In-Sook Han Lee\*, Chang Kiu Lee<sup>†</sup> and In Sup Han<sup>†</sup>

The choice of procedure for the preparation of 1-substituted benzyl-3-cyanoquinolinium iodides (2a-k) seems to be very limited.<sup>1</sup> We now report an ion exchange procedure in a specially chosen solvent mixture which optimizes the yields of iodide salts of nitrogen containing heterocyclic aromatic compounds.

X: 1 = Br, 2 = I

X: 3 = Br, 4 = I

X: 5 = Br

Y: a-h = CN, i-j = CONH<sub>2</sub>, k = H

Y: a = CONH<sub>2</sub>, b = H

6 = I

Ar: a = C<sub>6</sub>H<sub>5</sub>, b = *p*-CH<sub>3</sub>C<sub>6</sub>H<sub>4</sub>

c = *p*-FC<sub>6</sub>H<sub>4</sub>, d = *m*-FC<sub>6</sub>H<sub>4</sub>

e = *p*-BrC<sub>6</sub>H<sub>4</sub>, f = *p*-CF<sub>3</sub>C<sub>6</sub>H<sub>4</sub>

g = *m*-CF<sub>3</sub>C<sub>6</sub>H<sub>4</sub>, h = *p*-CNC<sub>6</sub>H<sub>4</sub>

i = C<sub>6</sub>H<sub>5</sub>, j = *p*-FC<sub>6</sub>H<sub>4</sub>, k = C<sub>6</sub>H<sub>5</sub>

The 1-substituted benzyl-3-cyanoquinolinium bromides (1a-k) were prepared by heating 3-cyanoquinoline and corresponding benzyl bromides.<sup>2-4</sup> The key feature is the replacement of bromide ion by iodide ion in a mixed solvent system of ethanol-water (10:1 v/v). Ethanol alone was not suitable because of the low solubility of potassium bromide in it. On the other hand, excess water was not desirable because the products were too soluble.

These iodide salts have not been reported previously and their characterization is rather difficult because their spectra are nearly identical to those of the corresponding bromide salts. However, melting points and elemental analyses seemed to be satisfactory for the purpose.

TABLE 1. Elemental Analysis Data

Compd	Mol. Form.	Calcd (Found)			
		C	H	N	I

## EXPERIMENTAL SECTION

Melting points were determined on a Thomas-Hoover melting point apparatus and are uncorrected. Elemental analyses were performed by the M-H-W Laboratories, Phoenix, Arizona.

1-Benzyl-3-cyanoquinolinium Iodide. General Procedure.- A mixture of KI (2 mmoles) and ethanol (30 mL) was stirred until complete solution resulted at room temperature. The bromide 1 (1 mmole) was added to this solution. Reaction took place immediately and the pale yellow solution turned reddish orange in all the cases in this series. After stirring for 30 min, distilled water (3 mL) was added and the mixture was warmed on a hot plate just enough to give a clear solution. Upon cooling to room

temperature, an orange precipitate formed and was collected and recrystallized from absolute ethanol to give the iodide salt 2.

Acknowledgement. - The present study was supported by the Basic Science Research Institute Program, Ministry of Education, 1985. We thank Professor Maurice M. Kreevoy of University of Minnesota for his helpful support.
