N-BROMOSUCCINIMIDE - CHLOROFORM, A MORE CONVENIENT METHOD TO NUCLEAR BROMINATE REACTIVE AROMATIC HYDROCARBONS

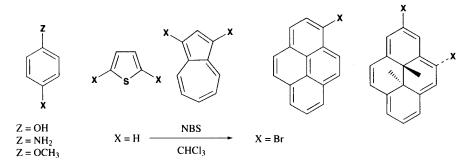

Submitted by Reginald H. Mitchell^{*}, Yongsheng Chen, and Ji Zhang (06/25/97) Department of Chemistry, University of Victoria, PO Box 3065 Victoria, BC, CANADA V8W 3V6

Although NBS is well known as a free radical brominating reagent for allylic and benzylic hydrogens, its use in the electrophilic bromination of aromatic rings is much less known. In 1979, we reported the use of NBS-DMF as a mild, selective nuclear monobromination reagent for reactive aromatic compounds.¹ Even though DMF is not the easiest solvent to handle, this reagent has since that time, found use in a variety of cases,² many of which are quite complex natural products. However, we have noted³ that if the DMF is wet, problems can occur; for example, the dihydropyrene **1** gives bromide **2** with dry DMF, but quinone **3** if the DMF contains traces of water. Others⁴ have also observed that

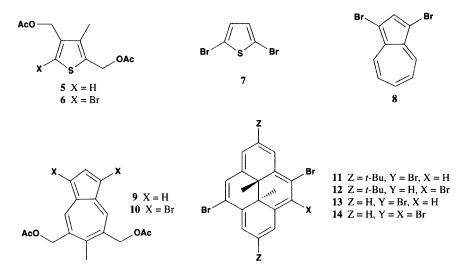

DMF is not an easy solvent to remove, having both a high boiling point and limited solubility in water, and thus investigated acetonitrile as an alternative solvent for methoxybenzenes and naph-thalenes. In cases that are sensitive to water, the use of acetonitrile can present problems. Nevertheless, in order to obtain reasonable reaction rates at room temperature, some polarity in the solvent is

required. Therefore we investigated the much easier handled solvent, chloroform and now report that NBS-CHCl₃ at room temperature provides a convenient method to effect the nuclear bromination of reactive aromatic substrates such as anilines, anisoles, phenols, thiophene, mesitylene, azulene, pyrene and *trans*-10b,10c-dimethyldihydropyrene to give products which are easily isolated. Two or more bromine atoms can be introduced for thiophene, azulene and *trans*-dimethyldihydropyrene. Rather than optimize each individual case, we have attempted to establish conditions that work well for a variety of substrates.

Azulene does not form a monobromide cleanly, but can be dibrominated (below). Anthracene only forms about 30% of 9-bromoanthracene under the above conditions. It is interesting that dihydropyrene 1 gives almost exclusively (>95%) the 2-bromide 2 in dried DMF, whereas in acetonitrile a 3:1 mixture of 2 and 4 is obtained; in CHCl₃ the ratio of these two isomers is 1:1. The use of CHCl₃ is thus especially useful, since access to the 4-derivatives of dihydropyrene has been very restricted until now.⁷

The use of larger quantities of NBS permits higher brominated products to be obtained. With 2 equivalents of NBS, thiophene gave 56% of 2,3-dibromothiophene^{5a,c} **7**. Azulene cleanly yields 86% of 1,3-dibromoazulene, **8**, mp 76-77°,⁸ if acetic acid (2 mL/100mL) is added to the CHCl₄;

otherwise reaction is not complete. Likewise the substituted azulene 9 yields dibromoazulene 10, in 57% yield. The 2,7-di-*tert*-butyl derivative of 1 with 2 equivalents of NBS in CHCl₃ yields >95% of the 1:1 mixture of dibromides 11 and 12.⁹

With 4 equivalents of NBS in $CHCl_3$ at room temperature for 24 h and followed by reflux for 24 h, Dihydropyrene (1) actually yields about 60% of tetrabromide, from which 36% of the tetrabromide 13 can be obtained pure by fractional recrystallization. Further bromination of 13 is slow, 10 equivalents of NBS yield pentabromide, from which 14 can be obtained in 21% yield by fractional recrystallization.

In summary, we believe that $NBS-CHCl_3$ is a useful addition to the reagents that can nuclear brominate reactive aromatic hydrocarbons under mild conditions.

EXPERIMENTAL SECTION

Melting points were determined on a Reichert 7905 melting point apparatus. IR spectra, major peaks only, were recorded on a Bruker IFS25 FT-IR as KBr disks. Proton NMR spectra were recorded at 300 MHz in CDCl₃ on a Bruker AC300 (¹³C NMR at 75.5 MHz). Mass spectra were measured on a Kratos Concept-H instrument. Elemental analyses were carried out by Canadian Microanalytical Services, Ltd, Vancouver, BC. All evaporations were carried out at reduced pressure, and the silica gel was Merck, 70-230 mesh.

Substrate	Product	Yield	Identity ^a
Aniline	<i>p</i> -bromoaniline	90%	2 , 482A
Anisole	<i>p</i> -bromoanisole	84%	2 , 187A
Phenol	p-bromophenol	81%	2 , 253C
m-Cresol	4-bromo-m-cresol	85%	b
Mesitylene	2-bromomesitylene	90%	2 , 122A
Pyrene	2-bromopyrene	96%	b
Thiophene	2-bromothiophene	71%	c
5	6	95%	d
1	2 and 4 (1:1)	80%	e

TABLE 1. Monobromination of Substrates using NBS-CHCl₃ (General Procedure).

a) Samples were compared to authentic samples by ¹H and ¹³C NMR, and by mp where appropriate;
 e. g. 2, 482A refers to the Aldrich Library of ¹³C and ¹H FT NMR Spectra, Edition I, spectrum number. b) Prepared by us previously.¹ c) Oil⁵; Reference 5c gives the ¹H NMR spectra of both 2- and 3-bromothiophene which are completely different. d) Oil; properties below. e) ¹H NMR spectrum below.

General Procedure.- The arene (2 mmol) and NBS (2.1 mmol) were stirred in reagent grade $CHCl_3$ (as obtained, 25 mL) at 15-20° for 24 h. The mixture was then washed with water, and additional $CHCl_3$ was added if needed, and then the organic layer was dried and evaporated to give product. Further purification was generally not necessary but if required, chromatography over silica gel with

OPPI BRIEFS

hexane as eluant was used. The results are shown in Table 1. On the 100 mmol scale, 300 mL of CHCl₃ can be used.

Compound 6: ¹H NMR 5.06 (s, 2H, -CH₂O-), 4.94 (s, 2H, -CH₂O-), 2.16 (s, 3H, -CH₃), 2.00 (s, 6H, -COCH₃); ¹³C NMR: δ 170.7, 170.6, 137.0, 135.1, 132.5, 115.1, 59.2, 58.2, 20.8, 20.7, 12.7; IR (KBr) 1743 cm⁻¹.

Anal. Calcd for C₁₁H₁₃BrO₄S: C, 41.14; H, 4.08. Found: C, 40.86; H, 4.52

Compound 4: ¹H NMR 8.90 (d, H-3), 8.85 (s, H-5), 8.64-8.54 (m, H-1,6,8,9,10), 8.20 (t, H- 2), 8.13 (t, H-7), -4.14 and -4.15 (s, -CH₃). This compound could not be separated pure from **2**, but is easily distinguished by ¹H NMR (see reference 6 for ¹H NMR of **2**).

1,3-Dibromoazulene (8), from azulene (256 mg, 2.0 mmol) and NBS (712 mg, 4.0 mmol) in CHCl₃ (49 mL + 1 mL acetic acid) using the general procedure above gave 492 mg (86%) of **8**, mp 76-77° (lit⁸ mp 76-77°); ¹H NMR: δ 8.29 (d, 2H, J = 9.5 Hz), 7.79 (s, 1H), 7.67 (t, 1H, J = 9.5 Hz), 7.26 (t, 2H, J = 9.5 Hz); ¹³C NMR: δ 140.1, 138.2, 136.7, 135.8, 124.1, 102.7.

1,3-Dibromo-5,7-*bis*(methylcarbonyloxymethyl)-6-methylazulene (10), from 9 (240 mg, 0.84 mmol), NBS (300 mg, 1.7 mmol) and CHCl₃-AcOH (49 mL + 1 mL) was obtained 210 mg (57%) of 10, mp 148-150°; ¹H NMR: δ 8.30 (s, 2H), 7.72 (s, 1H), 5.32 (s, 4H), 4.82, (s, 2H), 2.61 (s, 3H), 2.14 (s, 6H); ¹³ C NMR: δ 170.8, 152.2, 138.9, 138.3, 133.0, 130.0, 104.5, 69.7, 21.0, 20.8; IR (KBr) 1730 cm⁻¹; MS (FAB) M⁺ at *m/z* 442, 444, 446.

Anal. Calcd for C₁₇H₁₆Br₂O₄: C, 45.98; H, 3.63. Found: C, 46.12; H, 3.61

2,4,7,9-Tetrabromo-10b,10c-dimethyl-10b,10c-dihydropyrene (13), by the general procedure using 4 equiv. of NBS, followed by an additional 24 hours at reflux. Three recrystallizations from methanol yielded 36% of dark green crystals, mp 231-232°; ¹H NMR: δ 8.99 (s, 2H), 8.69 (s, 2H), 8.64 (s, 2H), -3.76 (s, 6H); ¹³C NMR: δ 137.0, 132.9, 128.2, 127.9, 127.6, 121.1, 117.2, 31.9, 14.3. *Anal.* Calcd for C₁₈H₁₂Br₄: C, 39.46; H, 2.21. Found: C, 39.28; H, 2.25

2,4,5,7,9-Pentabromo-10b,10c-dimethyl-10b,10c-dihydropyrene (14).- As for 13, except 10 equiv. NBS used. Three recrystallizations from methanol gave 21% of dark green crystals of 14, mp 247-248°; ¹H NMR: δ 9.15 (s, 1H), 9.12 (s, 1H), 9.01 (s, 1H), 8.67 (s, 1H), 8.63 (s, 1H), -3.62 (s, 3H), -3.64 (s, 3H); HRMS calcd for C₁₈H₁₁⁷⁹Br₅: 621.6778. Found: 621.6771.
