4*H*-Pyran-4-ones are heterocycles with useful biological properties.¹ These compounds are valuable as fungicides, herbicides and in the treatment of hypersensitivity conditions, such as asthma and allergies.² Functionalized heterocycles are often used for the synthesis of the target organic compounds. The synthesis of 2-bromomethyl-6-methyl-4*H*-pyran-4-one (**2b**) was reported by Buu-Hoi³ and Yamamoto⁴ in low yields. Both of these groups were only able to document the formation of the compound and the published data on this method is very misleading. Bromination of 2,6-dimethyl-4*H*-pyran-4-one (**1**) with two equivalents of N-bromosuccinimide in the presence of dibenzoyl peroxide in tetrachloromethane led to six brominated compounds **2a-f**, in very small yields and after a very tedious and long acquisition time (*Scheme 1*).⁵

Scheme 1

The bromomethyl function could also be obtained from the appropriate primary alcohol group by reaction with hydrogen bromide. 2,6-bis(Hydroxymethyl)-4H-pyran-4-one (4b) has been synthesized by sodium borohydride reduction of dimethyl chelidonate (3),6 albeit in poor yield and after a difficult separation process (Scheme 2). Although some of the 4H-pyran-4-ones containing a hydroxymethyl group can be prepared by fermentation⁷, e.g. of kojic acid, chemical preparations in high yield have not been reported. This paper reports a novel method for the synthesis of bromomethyl, acetoxymethyl and hydroxymethyl derivatives of 4H-pyran-4-one substituted at positions 2 and 6.

^{© 2000} by Organic Preparations and Procedures Inc.

Scheme 2

In view of the low reactivity of 1 toward bromination, we were compelled to search for a compound which was not only more reactive toward bromination but which also could be easily converted to derivatives of 1. The magnesium dimethyl acetonedicarboxylate chelate complex (6a) was prepared by treatment of dimethyl acetonedicarboxylate with MgCl₂ in the presence of aqueous ammonia in 83% yield, according to the method described by Yamato for the ethyl ester derivative 6b.8 Compound 6a is a complex with a coordination number of six, which incorporates two molecules of water (elemental analysis and ¹H NMR spectrum). 2,6-Dimethyl-4-oxo-4H-pyran-3,5-dicarboxylic acid dimethyl ester (7a) was obtained in 59% yield by treatment of 6a with acetic anhydride according to the procedure described for the diethyl ester derivative 7b.9 Hydrolysis of compounds 7a or 7b in the presence of sulfuric acid and acetic acid produced 1 in 85 and 88% yields, respectively (Scheme 3). 2,6-bis(Bromomethyl)-4-oxo-4H-pyran-3,5-dicarboxylic acid diethylester (8b) was first prepared in 1991 by Flitsch through bromination of 7b with bromine. ¹⁰ We prepared the corresponding

dimethyl ester derivative **8a** in 74% yield similarly. Acidic hydrolysis of **8a** or **8b** produced 2,6-bis(bromomethyl)-4H-pyran-4-one (**2a**) in 59 and 61% yields, respectively (Scheme 3). As a result we attempted to synthesize 2-bromomethyl-6-methyl-4-oxo-4H-pyran-3,5-dicarboxylic acid diester (**9a-b**) by means of Wohl-Ziegler bromination. Bromination was performed by reaction of **7a** with 1.25 equivalent of N-bromosuccinimide in the presence of dibenzoyl peroxide in tetrachloromethane at 50° and purified by column chromatography. The first fraction was **9a** in 43% yield and the second fraction was 41% of unreacted **7a**. Bromination of **7b** under similar conditions yielded **9b** in 55% yield as the first fraction and 36% of unreacted **7b** recovered by chromatography. Acidic hydrolysis of **9a** or **9b** similarly produced **2b** in 73 and 79% yields, respectively (Scheme 3).

Scheme 4

It is often necessary in organic synthesis to convert alcohols into alkyl halides, but only occasionally is it necessary to achieve the reverse conversion, *i. e.* the hydrolysis of alkyl halides. As a consequence relatively few reagents have been developed for this purpose. ¹² The more reactive alkyl halides, *i. e.* tertiary, benzyl and allyl halides can be hydrolysed easily by water in various solvents ¹² or by aqueous bicarbonate. ¹³ However, the hydrolysis of primary alkyl halides is more difficult and has usually been achieved using alkali metal hydroxides, ¹² though in a few simple cases it has been shown that water in N-methylpyrrolidone or hexamethylphosphoramide can achieve hydrolysis. ¹⁴ However, 4*H*-pyran-4-one ring is unstable under basic conditions, therefore, direct substitution of the halide by a hydroxy group is not possible. We attempted to convert bromomethyl groups smoothly to hydroxymethyl groups under conditions that would not open the ring of 4*H*-pyran-4-one molecule. Thus, treatment of the bromomethyl derivatives **2a**, **2b**, **8a**, **8b**, **9a** or **9b** with silver acetate in glacial

Scheme 5

SHAHRISA, TABRIZI AND AHSANI

acetic acid produced the corresponding acetoxymethyl derivatives **10a-f** respectively (*Scheme 4*).¹⁵ Yields of these reactions ranged from 78 to 89%. We also obtained these conversions by potassium fluoride in acetic acid¹⁶ in 42 to 59% yields.

Mild acidic hydrolysis of **10a** and **10b** produced **4b** and **11** in 92 and 95% yields, respectively (*Scheme 5*). Under vigorous acidic condition **10c** or **10d** converted to **4b** in 18 and 16% yields, respectively. Similarly **10e** or **10f** converted to **11** in 22 and 27% yields, respectively (*Scheme 5*).

The data obtained from Mass, IR, ¹H and ¹³C NMR spectra and elemental analyses are fully consistent with the proposed structures.

EXPERIMENTAL SECTION

Melting points were determined with an Electrothermal Instrument model 9100 and are uncorrected. Infrared (FT-IR) spectra were run on a Shimadzu 8010M Spectrophotometer as KBr disks or as smears between salt plates. The ¹H NMR spectra were recorded on a Varian-EM 390 spectrometer. The ¹³C NMR spectra were determined on an FT-NMR Brucker 80 MHz spectrometer. Chemical shifts were reported in values in ppm with TMS as internal standard. Mass spectra were taken with a Shimadzu MS-QP 1100EX mass spectrometer. Elemental analyses were performed on a Heareus, CHN-O-RAPID analyzer. Starting materials were purchased from commercial sources.

Magnesium Dimethyl Acetonedicarboxylate Complex (6a).- To a mixture of 300 mL of water, 19.1 g (0.2 mole) of MgCl₂ and 34.8 mL (0.2 mole) of dimethyl acetonedicarboxylate cooled to 0°, was slowly added aqueous ammonia (10%) with stirring till the precipitate was formed at pH 9-10. After stirring for an hour, the precipitate was collected, washed several times with water and recrystallized from MeOH to give 6a (33.7 g, 83%) as a white solid, mp. 79-81°. IR (KBr): 3520, 3170, 2950, 1713, 1640, 1525 and 1245 cm⁻¹. ¹H NMR (CDCl₃): δ 2.22 (broad singlet, 4H, H₂O), 3.11 (s, 4H, -CH₂COO-), 3.54 -3.69 (m, 12H, -COOCH₃), 4.75 (s, 2H, -CH=C).

Anal. Calcd. for C₁₄H₂₂MgO₁₂: C, 41.35; H, 5.45. Found: C, 41.20; H, 5.40

Magnesium Diethyl Acetonedicarboxylate Complex (6b).- This compound was synthesized according to the literature⁸ with modification (using 10% aqueous ammonia under ice cooling and recrystalization of product from EtOH) in 87% yield as a white solid, mp. 71°, lit⁸ 72°. IR (KBr): 3530, 3170, 2960, 1710, 1640, 1520 and 1242 cm⁻¹. ¹H NMR (CDCl₃): δ 1.1-1.35 (m, 12H, -CH₃), 2.30 (broad singlet, 4H, H₂O), 3.11 (s, 4H, -CH₂COO-), 3.9-4.3 (m, 8H, -CH₂CH₃), 4.78 (s, 2H, -CH=C).

2,6-Dimethyl-4-oxo-4H-pyran-3,5-dicarboxylic Acid Dimethyl Ester (7a).- A solution of 32.5 g (0.08 mole) of **6a** in 40 mL acetic anhydride was heated 15 minutes at 100°. The reaction mixture was concentrated to one-third of volume under reduced pressure, made basic with saturated KHCO₃ solution, and extracted with 3x40 mL of EtOAc. The EtOAc layer was washed with 3x25 mL of water, dried over MgSO₄ and concentrated *in vacuo*. The residue, after cooling in the refrigerator, was filtered and recrystallized from CH₂Cl₂-cyclohexane to give **7a** (22.7g, 59%) as white crystals, mp. 88-90°. IR (KBr): 2940, 1742, 1718, 1648, 1613, 1425, 1395 and 1250 cm⁻¹. ¹H NMR (CDCl₃): δ 2.27

(s, 6H, -CH₃), 3.70 (s, 6H,-OCH₃). ¹³C NMR (CDCl₃): δ 15.0 (-CH₃), 55.0 (-OCH₃), 122.5 (pyran-C-3,-5), 157.5 (pyran-C-2,-6),162.0 (-COOCH₃), 171.5 (pyran-C-4). MS (EI, 70eV): 240 (M⁺). *Anal.* Calcd. for C₁₁H₁₂O₆: C, 55.00; H, 5.04. Found: C, 54.90; H, 5.10

- **2,6-Dimethyl-4-oxo-4***H*-**pyran-3,5-dicarboxylic Acid Diethyl Ester (7b).** This compound was synthesized according to literature⁹ with a little modification (after heating, the reaction mixture was concentrated to one-third of volume under reduced pressure) in 65% yield as colorless crystals, mp. 80°, lit. 9 79°. IR (KBr): 2950, 1740, 1715, 1650, 1615, 1410 and 1254 cm⁻¹. ¹H NMR (CDCl₃): δ 1.30 (t, 6H, J = 7 Hz, CH₂CH₃), 2.32 (s, 6H, -CH₃), 4.32 (q, 4H, J = 7 Hz, -CH₂CH₃).
- **2,6-bis**(Bromomethyl)-4*H*-pyran-3,5-dicarboxylic Acid Dimethyl Ester (8a).- To a refluxing solution of 10.8 g (0.045 mole) of **7a** in 350 mL CH_2Cl_2 was added slowly with stirring a solution of 14.55 g (0.091 mole) Br_2 in 150 mL CH_2Cl_2 over 2 hrs and stirring was continued for another 1.5 hrs. The solution was then washed with saturated NaHCO₃ solution and dried over MgSO₄. The solvent was removed by distillation and the residue was recrystallized from $CHCl_3$ -heptane to give **8a** (13.25 g, 74%) as a white solid, mp. 131-133°. IR (KBr): 2995, 1735, 1645, 1390, 1260, 1100 and 1040 cm⁻¹. ¹H NMR (CDCl₃): δ 3.65 (s, 6H, -OCH₃), 4.25 (s, 4H, -CH₂Br). ¹³C NMR (CDCl₃): δ 26.0 (-CH₂Br), 55.0 (-OCH₃), 124.0 (pyran-C-3,-5), 159.0 (pyran-C-2,-6), 162.0 (-COOCH₃), 172.0 (pyran-C-4). MS (EI, 70 eV): 400/398/396 (M⁺).

Anal. Calcd. for C₁₁H₁₀Br₂O₆: C, 33.20; H, 2.53. Found: C, 33.0; H, 2.60

- **2,6-***bis*(**Bromomethyl**)-**4***H*-**pyran-3,5-dicarboxylic Acid Diethyl Ester (8b)**.- This compound was synthesized according to the literature, ¹⁰ in 77% yield as a white solid, mp. 122°, lit. ¹⁰ 124°. IR (KBr): 3050, 2990, 1735, 1665, 1640, 1400, 1260, 1090 and 1040 cm⁻¹. ¹H NMR (CDCl₃): δ 1.30 (t, 6H, J=7 Hz, CH₂CH₃), 4.30 (s, 4H, -CH₂Br), 4.40 (q, 4H, J=7Hz, -CH₂CH₃).
- 2-Bromomethyl-6-methyl-4-oxo-4*H*-pyran-3,5-dicarboxylic Acid Dimethyl Ester (9a).- A mixture of 10.8 g (0.045 mole) of **7a**, 10 g (0.056 mole, 1.25 equivalent) of N-bromosuccinimide, 1g of dibenzoyl peroxide and 400mL of tetrachloromethane was heated at 50° for 20 hrs. The reaction mixture was concentrated under reduced pressure and 200 mL CH₂Cl₂ was added to the residue. The mixture was filtered and the filtrate washed with saturated sodium carbonate solution and with water and dried over MgSO₄. The solvent was removed by distillation and the residual oil was purified by column chromatography on silica gel using ethylacetate petrolium ether (1:3) as eluent to give **9a** (6.17 g, 43%) as pale brown crystals, mp. 133.6-135.2°. IR(KBr): 2995, 1740, 1660, 1420, 1270, 1170 and 1100 cm⁻¹. ¹H NMR (CDCl₃): δ 2.30 (s, 3H, -CH₃), 3.70 (s, 6H, -OCH₃), 4.30 (s, 2H, -CH₂Br). ¹³C NMR (CDCl₃): δ 15.0 (-CH₃), 25.0 (-CH₂Br), 53.0 (-OCH₃), 120.0 (pyran-C-5), 125.0 (pyran-C-3), 157.0 (pyran-C-6), 160.0 (pyran-C-2), 163.0 (-COOCH₃), 172.0 (pyran-C-4). MS (EI, 70ev): 320/318 (M⁺).

Anal. Calcd. for C₁₁H₁₁BrO₆: C, 41.40; H, 3.47. Found: C, 41.60; H, 3.60

Compound 7a (4.43 g, 41%) was recovered as second fraction.

2-Bromomethyl-6-methyl-4-oxo-4*H*-pyran-**3,5-dicarboxylic Acid Diethyl Ester (9b)**.- Prepared as above from 12.1 g (0.045 mole) of **7b**. The oil was purified by column chromatography on silica gel

SHAHRISA, TABRIZI AND AHSANI

using ethyl acetate-petroleum ether (1.5:8.5) as eluent to give **9b** (8.59 g, 55%) as pale brown crystals, mp. 121.4 - 122.3°. IR (KBr): 2985, 1738, 1662, 1415, 1269, 1169 and 1100 cm⁻¹. ¹H NMR (CDCl₃): δ 1.30 (t, 6H, J=7.5 Hz, -CH₂CH₃), 2.40 (s, 3H, -CH₃), 4.30 (s, 2H, -CH₂Br), 4.40 (q, 4H, J=7.5 Hz, -CH₂CH₃). ¹³C NMR (CDCl₃): δ 13.2 (-CH₂CH₃), 15.0 (-CH₃), 24.0 (-CH₂Br), 60.0 (-COOCH₂-), 122.0 (pyran-C-5), 125.0 (pyran-C-3), 157.0 (pyran-C-6), 160.0 (pyran-C-2), 162.0 (-COOCH₂-), 171.0 (pyran-C-4). MS (EI, 70 eV): 348/346 (M⁺).

Anal. calcd. for $C_{13}H_{15}BrO_6$: C, 44.98; H, 4.36. Found: C, 45.10; H, 4.20 Compound **7b** (4.34 g, 36%) was recovered as second fraction.

General Procedure for the Synthesis of 1, 2a, 2b.- A mixture of 0.01 mole of 7-9, 20 mL acetic acid, 20 mL water and 5 mL concentrated H₂SO₄ was refluxed for 5hrs. The mixture was neutralized with aqueous sodium hydroxide (40%) to pH 4-5 under cooling. The mixture was filtered, and the filtrate adjusted to pH 7-8 by addition of sodium carbonate. The mixture was concentrated to one-third volume under reduced pressure and extracted with 5x30 mL CH₂Cl₂ and the combined organic layer washed with 4x20 mL H₂O and dried over MgSO₄. The solvent was removed by distillation and the remaining solid was recrystallized from EtOH to yield pure product. Specific details are given for each compound.

2,6-Dimethyl-4H-pyran-4-one (1).- a) From 2.4 g of **7a**, 1.05 g (85%) of white crystals were obtained, mp. 132°, lit.⁴ 131°. IR (KBr): 3050, 1660, 1600 and 1390 cm⁻¹. ¹H NMR (CDCl₃): δ 2.20 (s, 6H, -CH₃), 6.0 (s, 2H, pyran-CH-3,-5); b) From 2.68 g of **7b**, 1.09 g (88%) of white crystals with similar physical and spectral properties were obtained.

2,6-bis(Bromomethyl)-4H-pyran-4-one (2a).- a) From 3.98 g of **8a**, 1.66 g (59%) of pale brown crystals were obtained, mp. 91°, $lit.^5$ 91°. IR (KBr): 3010, 1660, 1605 and 1394 cm⁻¹. ¹H NMR (CDCl₃): δ 4.19 (s, 4H, -CH₂Br), 6.36 (s, 2H, pyran-CH-3,-5); b) From 4.26 g of **8b**, 1.72 g (61%) of pale brown crystals with similar physical and spectral properties were obtained.

2-Bromomethyl-6-methyl-4H-pyran-4-one (**2b**).- a) From 3.19 g of **9a**, 1.48 g (73%) of beige crystals were obtained, mp. 108° , $lit.^{5}$ 107° . IR (KBr): 3030, 1665, 1600 and 1390 cm⁻¹. ¹H NMR (CDCl₃): δ 2.65 (s, 3H, -CH₃), 4.20 (s, 2H, -CH₂Br), 6.30 (s, 2H, pyran-CH-3,-5); b) From 3.47 g of **9b**, 1.56 g (77%) of beige crystals with similar physical and spectral properties were obtained.

General Procedure for Acetoxylation of 2a, 2b, 8a, 8b, 9a and 9b.- A mixture of 5.0 mmoles of bromomethyl derivatives, 2b, 9a or 9b, or 2.5 mmoles of bis(bromomethyl) derivatives, 2a, 8a or 8b, 0.92 g (5.5 mmole) silver acetate and 15 mL glacial acetic acid was refluxed for 4hrs. The mixture was filtered and 50 mL of water was added to the filtrate and the mixture was extracted with 3x15 mL CH₂Cl₂. The combined organic layer was washed with 3x10 mL of H₂O, dried over MgSO₄ and the solvent was removed by distillation. Specific details are given for each compound.

2, 6-bis(Acetoxymethyl)-4H-pyran-4-one (10a).- From 0.71 g of 2a, 0.52 g (86%) of a yellow oil was obtained. IR (KBr): 2946, 1754, 1677, 1415, 1230, 1046 and 931 cm⁻¹. ¹H NMR (CDCl₃): δ 2.09 (s, 6H, -OOCCH₃), 4.84 (s, 4H, -CH₂OOC-), 6.25 (s, 2H, pyran-CH-3,-5). ¹³C NMR (CDCl₃): δ 20.0 (-OOCCH₃), 60.7 (-CH₂OOC-), 113.9 (pyran-C-3,-5), 162.2 (pyran-C-2,-6), 169.4 (-OOCCH₃),

178.6 (pyran-C-4). MS (EI, 70eV): 240 (M⁺).

Anal. Calcd. for C₁₁H₁₂O₆: C, 55.0; H, 5.04. Found: C, 54.70; H, 5.20

2-Acetoxymethyl-6-methyl-4H-pyran-4-one (**10b**).- From 1.02 g of **2b**, 0.81 g (89%) of a yellow oil was obtained. IR (KBr): 2931, 1754, 1677, 1631, 1400, 1231, 1038 and 931 cm⁻¹. ¹H NMR (CDCl₃): δ 2.0 (s, 3H, -OOCCH₃), 2.13 (s, 3H, -CH₃), 4.74 (s, 2H, -CH₂OOC-), 6.0 (s, 1H, pyran-CH-5), 6.15 (s, 1H, pyran-CH-3). ¹³C NMR (CDCl₃): δ 17.0 (-CH₃), 20.0 (-OOCCH₃), 61.0 (-CH₂OOC-), 110.0 (pyran-C-5), 115.0(pyran-C-3), 159.0 (pyran-C-6), 162.5 (pyran-C-2), 170.0 (-OOCCH₃), 179.1 (pyran-C-4). Anal. Calcd. for C₁₃H₁₄O₈: C, 52.35; H, 4.73. Found: C, 52.60; H, 4.90

2-Acetoxymethyl-6-methyl-4-oxo-*4H*-pyran-3,5-dicarboxylic Acid Diethyl Ester (10f).- From 1.74 g of 9b, 1.40 g (86%) of a yellow oil was obtained. IR (KBr): 2985, 1746, 1669, 1423, 1223 and 1100 cm⁻¹. ¹H NMR (CDCl₃): δ 1.30 (t, 6H, J= 7 Hz, -CH₂CH₃), 2.04 (s,3H, -OOCCH₃), 2.35 (s, 3H, (-CH₃), 4.40 (q, 4H, J=7 Hz, -CH₂CH₃), 5.0 (s, 2H, -CH₂OOC-). ¹³C NMR (CDCl₃): δ 12.0 (-CH₂CH₃), 15.0 (-CH₃), 20.0 (-OOCCH₃), 60.0 (-COOCH₂CH₃), 62.0 (-CH₂OOCCH₃), 122.0 (pyran-C-5), 126.0 (pyran-C-3), 159.0 (pyran-C-6), 162.0 (pyran-C-2), 163.0 (-COOCH₂CH₃), 169.4 (-OOCCH₃), 171.0 (pyran-C-4). MS (EI, 70 eV): 326 (M⁺).

Anal. Calcd. for C₁₅H₁₈O₈: C, 55.21; H, 5.56. Found: C, 55.40; H, 5.70.

SHAHRISA, TABRIZI AND AHSANI

General Procedure for Hydrolysis of 10a and 10b.- A mixture of 4.0 mmoles of 10a or 10b, 20 mL THF, 10 mL water and 0.5 mL concentrated hydrochloric acid was refluxed for 16 hrs. The mixture was cooled and neutralized by the addition of NaHCO₃ to pH 6-7. The mixture was then concentrated under reduced pressure and the residue, after complete drying, was extracted with several portions of MeOH and the combined organic solution was concentrated *in vacuo*. Specific details are given for each compound.

2, 6-bis(Hydroxymethyl)-4H-pyran-4-one (4b).- From 0.96 g of 10a, 0.57 g (92%) of a white solid was obtained, mp. 110°, lit.⁶ 111°. IR (KBr): 3385 (broad), 2938, 1680, 1625, 1279, 1109 and 932 cm⁻¹. ¹H NMR (DMSO-d₆): δ 3.63 (s, 2H, -CH₂OH), 4.29 (s, 4H, -CH₂OH), 6.17 (s, 2H, pyran-CH-3,-5).

2-Hydroxymethyl-6-methyl-4*H***-pyran-4-one** (11).- From 0.73 g of 10b, 0.53 g (95%) of a white solid was obtained, mp. 135°. IR (KBr): 3390 (broad), 2940, 1678, 1615, 1280, 1100 and 938 cm⁻¹. 1 H NMR (DMSO-d₆): δ 2.20 (s, 3H, -CH₃), 3.45 (s, 1H, -CH₂OH), 4.25 (s, 2H, -CH₂OH), 6.0 (s, 1H, pyran-CH-5), 6.13 (s, 1H, pyran-CH-3). MS (EI, 70 eV): 140 (M⁺).

Anal. Calcd. for C₂H₈O₃: C, 60.0; H, 5.75. Found: C, 59.80; H, 5.90.

General Procedure for the One-pot Hydrolysis and Decarboxylation Reaction of 10c-f.- A mixture of 3.5 mmoles of 10c-f, 5 mL acetic acid, 5 mL water and 1 mL concentrated H₂SO₄ was refluxed for 12 hrs. The mixture was cooled and neutralized with the addition of aqueous sodium hydroxide (50%) to pH 5-6 and then adjusted to pH 7-8 with addition of sodium carbonate. The mixture was extracted with 2x10 mL CH₂Cl₂. The aqueous layer was concentrated under reduced pressure and the residue, after complete drying, was extracted with several portions of MeOH and the combined organic solution was concentrated *in vacuo*. Specific details are given for each compound.

Compound 4b.- From 1.25 g of **10c**, 0.1 g (18%) of **4b** was obtained. From 1.35 g of **10d**, 0.09 g (16%) of **4b** was obtained. The physical and spectral properties were identical to that of **4b** reported earlier.

Compound 11.- From 1.05 g of **10e**, 0.11 g (22%) of **11** was obtained. From 1.14 g of **10f**, 0.13 g (27%) of **11** was obtained. The physical and spectral properties were identical to that of **11** reported earlier.

Acknowledgment.- Financial support for this work by the Research Council of Tabriz University is gratefully acknowleged.
