# PHILOSOPHICAL TRANSACTIONS.

Novemb. 20, 1671.

## THE CONTENTS.

*Observations made by Mr. Hook, both of the Solar Spots lately discover'd, and the Eclipse of the Moon of Sept. 8. 1671. Some Additions of M. Lister to his former Communications about Vegetable Excrescencies, and Ichneumon Wasps, together with an Inquiry concerning Tarantula's. Predictions of the Visible Appulses of the Moon to, and her near Transits by certain Fixt Stars for A. 1672. An Accompt of some Books: I. SHEEPS BOVWen BESTIER, that is, NAVAL ARCHITECTURE and CONDUCT, in Low-Dutch, by N. Witzen. II. RECHERCHES & OBSERVATIONS sur les VIPERES, par Mons. Bourdelot. III. Admirandorum FOSSILIVM, quæ in tradi Hildesheimensi reperiuntur, Descriptio, à D. Frid. Lachmund. IV. De CATHARRHIS, A. R. Lower M.D. V. DELICIAE PHYSICÆ Goth. Voigts.*

*Observations made by Mr. Hook, of some Spots in the Sun, return'd after they had pass'd over the Upper Hemisphere of the Sun which is hid from Us; according as was predicted\*. \* see Numb. 75. p. 2253.*

**A**ugust 30. 1671. I saw a large Spot in the Center of the Suns face about noon, but had not then time to make any more exact observation thereof.

Septemb. 1. at 3 a clock I saw the same Spot moved about a quarter of the Diameter of the Sun Westward, and it appeared of this form exactly, that is, it consisted of one greater and two lesser black Spots with a dusky cloud encompassing them: The Diameter of the whole Phænomenon was about  $\frac{1}{2}$  of the Diameter of the Sun, and it was distant from the next adjoining limb,  $\frac{1}{2}$  (that is, exactly one quarter) of the Diameter of the Sun. This I examined and measured several times, and found very exact.

*so far He.* To which we hope we shall be able to add, by another opportunity, what hath been farther observed abroad, as well of the second progress of these Spots on the Sun's apparent disque, as of the continuation of their former motion thereon.

Uuu

*Observations*

*Observations made by the same, of the late Eclipse of the Moon, the 8th of September 1671. st. vet,*

**S**eptemb. 8. 1671. H. 7.  $27\frac{1}{2}$ . I first observed the Moon E. eclipsed when it began to be enlightened, the total darkness being already past: The shadow passed through the middle of the Spot called by *Hevelius M. Porphyrius*, half of the said spot appearing without the shadow and the other half being darkened thereby.

H. 7.49'. The shadow passed through the middle of *M. Sinai*, through the middle of the Eastermost of the three Lakes called *mare Adriaticum*, and just touched the ridge of the *Apennine Mountains*.

H. 7.54'. It passed the middle of the *J. Besbius* in the *Pontis*.

H. 8.0 $\frac{1}{2}$ . It passed through the streights of the *Pontus Euxinus* at the Promontories *Acherusia* and *Aristes*.

H. 8. 6' $\frac{1}{2}$ . It touched the *Palus Maeotis*, which *Palus Maeotis* was then distant from the limb of the Moon next adjacent one third part of its shorter diameter or breadth.

H. 8. 17'. The shadow went off the body of the Moon upon the innermost limb-line of *Hevelius* his large chart of the Moon at the 29 division just without the *J. Major* of the *Caspian Sea*. The dusky *Penumbra* left not the limb of the Moon quite without some kind of darkness, till 8. 29'; at which time I found that side of the Moon, which the shadow last left, was full as light and clear as the other.

About four or five minutes after, the shadow was gone off, I perceived a faint representation of Colours upon that part of the body of the Moon, which was most affected with the *Penumbra* somewhat resembling the colours of a faint *Halo* about the Moon; this grew fainter and fainter, and after a few minutes was no more visible. It did not seem to be caused by any clouds or exhalations in the Air, the sky near the Moon being very clear, and the said colours not appearing any where, but upon the dusky part of its *Phasis*. Possibly it might be caused by the Refraction of the light from the Sun through the Atmosphere about the Earth.

LUNÆ ad FIXAS Appulsus Visibiles, nec non arctiores juxta eas Transitus, observabiles A. 1672: Prædicti, & ad Meridianum Latitudinemque Londini, è Tabulis Carolinis accuratè supputati à Joh. Flamstedio Derbienli-Anglo.

**F I X A R U M** Nomina, Loci, Latitudines & Magnitudines, quibus vel corporales Appulsus vel propinquiores Transitus habet LUNA Anno 1672, de mente & placitis Antonii Carolini, sunt;
