Extracts of several Letters sent to the Publisher from Edinburg, by the Learn'd eMr. James Gregory to whom they were written by that intelligent Knight Sir George Makenzy from Tarbut.

nary: it broke a Standard-stone, that stood as an Obelisk near an old Church; which stone was about 12 foot high, 5 foot broad, and near 2 foot thick. Whose woods were over-turn'd, and torn up from the root, though in a low scituation. It blew from the North-west, and of a long time the wind had continued Westerly. Fan. 16. 1674.

2. I had notice of a Phanomenon, that I judged odd and confiderable in fearching into the nature of Cold, which is; That there is a litle Lake in Straberrick on the Lord Lovels Lands, which never freezes all over (even in the most vehement frosts,) before Tebruary; but one nights frost there-after will freeze it all over. and two nights then will make the Ice of a very confiderable thick-This I did inquire after very follicitously from the honestess and soberest of the adjoyning Inhabitants, and it was verified by fo many, that there was left no place to doubt the truth of the matter of fact. I have fince heard of two other Lakes, one of which is on Lands belonging to my felf, called Loch Monar, of a pretty largeness, which steddily keeps the same method, and I have inquired after it by many, who have affirm'd it to me on their own knowledge. There is another litle Lake in Straglash at Glencanich on Lands belonging to one Chisolm; the Lake lies in a bottom 'twixt the tops of a very high hill, so that the bottom it self is very high. This Lake never wants Ice on it in the middle, even in the hottest Summer, though it thaws near the edges: And this Ice is found on it, though the Sun by reason of the reflexion from the hills in that Country is very hot, and Lakes lying as high in the neighbourhood have no such phoenomenon. 'Tis observable also, that about the borders of this Lake the Grass keeps a continual verdure, as if it were in a constant Spring, and feeds and fattens beafts more in a week, then any other Grass doth in a forthnight. The matter of fact I have fully examined in both these; but to hit the cause, requires a better Philosopher then I am, &c. Februar, 8. 1674.

3. Our

- 3. Our famous Lake Ness never freezes; but on the contrary in the violentest frosts the greater clouds of steams do arise from it. And I remember, that at two several times, I being at Inverness, walking in the evenings along the bridge over the River Ness, a mist of those steams coming from the Lake and falling down to us over the River (for there was no mist in any place thereabout but on this Lake and River only, ) our hair became all white, like the whiteness of a hoare-frost, but it was soft and warm; and this was in the midst of Summer and in warm evenings. Last week I was speaking with Dr. George Makenzy (who lives at Inverness) of this matter: He told me, that he observes Rosemary to continue in the gardens about that Lakes fide, notwithstanding the last Winters long and violent frosts; whereas a far less violent Winter ordinarily kills all the Rosemary, which is in gardens that lye in warmer places and at the Sea-fide: And, which is more, though I live near it, and in a better foyle and warmer scituation; yet any Winter, more than ordinary cold, kills my Rosemary, though cover'd over with straw and litter: Whereas near Logh Nessit remained good, though uncover'd, in the last sharp Winter; which he attributes (and, I think, on good ground) to the warmth occasioned by those steams that frequently arise from that Lake. Febr. 25. 167%.
- 4. Having in my former Letters written of water, I shall yet add this of that subject; That in Glevelg at a place called Achigniglium there is a litle Rivolet, which so turns Holly into a greenish stone, that they ordinarily make moulds of it for casting of balls for suffees; and Tinkers that work in brass make both their moulds and melting pots of it; and women their round wharls for spinning. May it not be, that by the long insussion in water, descending from hills, which perhaps abound in marle capable to be resolved into small particles by the constant washing of the water, may it not be, I say, that these litle particles do intrude into the cleansed pores of the Holly, and so make up that soft stone? And any thing ligneous remaining of the very hard timber, being all incrustated with this marble, may it not thereby be guarded from the action of the sire? April 16. 1675.
