

Occultatio Martis & quarundam Fixarum
observata

G E D A N I,

Anno 1676, die 1. Sept. st.n. mane, Tubis in primis
12. & 20. pedum

à

Joh. Hevelio.

DIE 31 Augusti, aër omnino nubilosus, imò circa vesperam pluvius extitit, sic ut vix spes aliqua superfluerit Conjunctionem hanc artissimam Lunæ & Martis observandi; nihilominus tamen, cælo circa medium noctem undique sereno, observatio hæc notabilis, Lunâ pene diuidiatâ existente, ex voto successit; ut non solum ingressum Martis sub Lunam exactissime, sed etiam egressum ejus omnium optimè animadvertere nobis obtigerit; uti ex apposita observatione liquet. Initium accidit secundum horologium Oscillatorium, ex altitudinibus Fixarum correctum, horâ 1.35'.42", atque Finis horâ 2.46'.29". Mars verò obiectus est circa Montem Audum, incedens quasi per loca Luna Paludosa, per M. Aetnam, infra Insulam Lesbicam, supra Paludem Acherusiam, supra M. Coraeum, per Paludem Mæotidem, & paulò supra Insulam Alopeciacum & ipsum Lunæ centrum; sicque rursus ad Lacum majorem occidentalem exiens.

Si queras, unde viam itinerariam hanc adeò accuratè mihi determinare licuerit, & quidem ad partem Lunæ obscuram, scias, eò evenisse, quod Tubis illis meis præcipuas Maculas Majores in parte Lunæ umbrosâ satis distinctè deprehendere potuerim; atque ita dilucide conspexerim, Martem circa medium ferè Paludis Mæotidis emicuisse.

De cætero notandum occurrit, paulò post Martis egressum, aliam insuper stellulam fixam b, globo aliâ nondum adscriptam, vix ad 3' minut. prim. infra Martem versus Austrum, horâ nimurum 2.53'.35". exiluisse circa Paludes amaras; quam quidem Lunam subire haud animadverti: cum totus in eo fuerim, ut Martis momentum Occultationis præcisè determinarem; atque sic etiam alteram stellulam c Lunam appropinquare haud deprehendi, quam poste ac circa Martis exitum horâ scilicet 3.42'.20", ad cornu Lunæ inferius ad 4' ferè minut. remotam primum conspeximus. Quantum colligere datur stellula hæc c à Lunâ non omnino recta est, sed Luna eam solummodo quasi margine suo strinxit. Nihilominus spectaculum fuit admodum jucundum, cælo perquam sereno, non

tantum Martem prorsus occultatum, nec non alteram stellulam itidem planè tectam, sed pariter alteram stellulam limbo Lunæ adeò arctè conjunctam vidiisse; & quidem circa Lunam à Quadraturâ ultimâ recentem, ejusque partem obscuram rufus exilientes.

Adhac plures quidem stellulas incognitas circa Lunam conspeximus; verum cùm illæ parùm ad hancce observationem faciant, eas typo nostro haud adscriptimus.

Tabula Rudolphina quæ nonnunquam evidenter à cœlo discrepant, hanc insignem Martis Occultationem satis precise indicarunt. Siquidem initium Occultationis vix ad 5 minut. prim. diversam com: non strarunt, & in fine, & duratione non nisi ad 3' ferè minut. anticipando videlicet, aberrarunt.

Occultatio Martis, & nonnullarum Fixarum

observata

G E D A N I,

Anno 1676, die 1. Septemb. st.n.mane;

à

Job. Hevelio.

Temp. secund. horol. oscil.	Fixarum Nomina.	Altitudi- nes.	Temp. ex altit. corr.	Hor.	Animadvertis.

Martis

Martis à Luna tecti Observationes, Grenovici habitæ, Augusti 21. 1676.
à J. Flamstedio, in eorum gratiam qui differentiæ Meridianorum in-
vestigandæ incumbunt ; Editori ab eodem communicatæ.

Augusti 21. ante meridiem pro correctione horologii h. & limbi Solaris
altitudines acceperam :

Hora horologii.		Hor. supp.	Horol. error.
h.	o.	h.	o.
8. 04. 31	alt. limbi Solis infer.	26. 04	8 09 26
5.42	.	26. 14	8 10 35
7.58	.	26. 34	8 12 53
9.10	.	26.44	8 14 03
10.15	.	26. 54	8 15 12
17.15	.	27. 54	8 22 09

Deinde post Meridiem, calo serenissimo.

Hor. horol. Correcția.

39.00	43.55.	Lunæ diameter breviori tubo	3645=29.58
41°. ♂ secundum Typhonem locus nunc est ♂ 17. 58' latitudo			
1°. 20' Australis ; unde cum Luna tum Martis locus accurate de- duci potest. See Fig. IV.			

Mr.

Mr. Edmund Hally's Observations, concerning the same Occultation of Mars by the Moon, made at Oxford, Anno 1676.
Aug. 21. P.M.

Temp.Corr.

h.

11.43.30	The center of Mars from the Nearest limb of the Moon,	719 $\frac{1}{2}$	= 12.40
11.49. 2	Again,	571	= 10. 3
11.54.58	Again,	409	= 7.12
12. 3.25	The center of Mars from the North Cusp of D,	1118	= 19.41
12.10.28	The gibbous part of Mars touched the Moons limb.		
12.10.42	Mars was wholly covered, being distant from the Cusp,	963	= 17.14
12.40.00	At this time a Halo encompassed the Moon, in whose Circumference was Saturn, the Pleiades, Capella, and the following of the foot of Perseus.		
13.10.41	Mars did emerge, I suppose, his Center.		
13.12.45	Mars was distant from the Northern horn of D,	1018	= 17.55
13.31.10	Mars passed over a point noted in the Telescope.		
13.33.15	The Southern limb of Etna passed by the same point.		
13.34.00	The lucid limb passed over the same point.		
13.52.35	The Moons diam. observed, 1698 = 30'.1". alt. D 31°. circ.		
13.57.52	Mars from the Northern horn of the Moon,	2042	= 36. 5
14. 2.53	Mars from the Southern horn of the Moon.	2266	= 40. 3

Having carefully considered the Moons Parallaxes in the observations of this Occultation at Dantzick and Greenwich, I find from the Immersion the difference of Meridians between Greenwich and Oxford 4'.57"; between Greenwich and Dantzick 1°. 14'.50": By the Emerson the first of those differences is found 4'. 59", the latter 1°.14'.41": which near agreement shews the Exactness of all the Observations.

Two Letters written by Mr. John Beaumont Junior of Stony-Easton in Somerset-shire, concerning Rock-Plants and their growth.

SIR, *The First Letter of April 7. 1676.*

I Lately perused the greatest part of the Philosophical Transactions; in which I received so great a satisfaction, that I resolved to gratifie your generous Communications (if I may call it a gratuity) with some of the newest occurrents I have met with in Nature, which, if as kindly accepted, as freely sent you, I shall readily do the like for the future as far as my ability and observations will help me out.

What
