## I. Part of a Letter to the Publisher from Dr Davies concerning an unusual Colic.

Birmingham, Oct. 3d. 1701.

SIR,

Ast May, my Ingenious Friend Dr Shaw of Tamworth. was pleased to desire my assistance in the following case. A person, aged between 50 and 60, had been for 3 or 4 years last past troubled with Gripes, which generally return'd once a month, or thereabouts; his Body for the most part costive, and therefore was forced to four Nature with Daffy's Elixir or Aloes; fometimes the smoaking a Pipe of Tobacco, supply'd the use of rhese Medicines. Last April coming from London heated himfelf very much with his Journey, having walked a good part of the way, and as foon as he came home, had a return of his Colic pains, which continued upon him for 18 days, notwithstanding the methods commonly used in that case, during which time he had no Stool, befides what the first and second Clysters brought away : his complaint upon his seizure was of a pain in his right fide in the Regio Iliaca. Some time before he dyed his Belly swelled much, and was as tense as any Drum, he vomited for 2 or 3 days at the beginning, left him, and returned not till just before he dyed, which was at the expiration of the 18th day, at which time he brought up 2 or 3 mouthfuls of black Choler; but never during his whole illness vomited any excrement. Dr Shaw who lived upon the spot, prevail'd to have an hasty Inspection of his Abdomen, the Relations (it being a thing Malæ famæ in that Neighbourhood) defired it might be done with all secrecy and expedition, which

which prevented the Doctors taking so nice a view of all the parts within the Abdomen as he would otherwife have done. He found some black Choler in the Stomach, the Ducdenum and the rest of the Intestina tennia void of excrement, but incredibly distemper'd with Wind, and tracing the Canalis of the Guts as far as the Cacum, found that of a blackish colour; and from thence for about a yard in length, the Colon mortified and forotten, that the Excrements had made their way thro it at feveral places, into the Cavity of the Abdomen; about 2 inches of the mornfield Gut was fallened to the Peritonaum on the right side. This part of the Colon was so extended with excrements of a fost consistence, that they when taken out filled two Chamber-pots; at the extremity of the mortification, towards the Reclum the obstruction which occasioned all these mistortunes offered it self to view very plainly; for about ten inches of the Colon was doubled, as if you had taken a piece of Tape, and folded it the two contiguous furfaces of the duplicature adhered fo firmly together, that you could not separate them without tearing the exterior coat of the Intestine. Upon separating this coalescence, there fell from that part a whitish Mucus, the adhesion was about a inches broad; the middle of the Duplicature which made the acute angle, and where the excrements stopped, was smaller, and the Membranes thinner than in any other part of the Gut; from thence towards the Rectum the Colon was found, and void of excrements, occasioned by the frequent use of Clysters.
