

V. An Account, or History, of the Procuring the S M A L L
P O X by Incision, or Inoculation; as it has for some time
been practised at Constantinople.

Being the Extract of a Letter from Emanuel Timonius,
Oxon. & Patav. M. D. S. R. S. dated at Constantinople,
December, 1713.

Communicated to the Royal Society by John Woodward, M. D.
Profes. Med. Gresh. and S. R. S.

TH E Writer of this ingenious Discourse observes, in the first place, that the *Circassians, Georgians, and other Asiaticks*, have introduc'd this Practice of procuring the *Small-Pox* by a sort of Inoculation, for about the space of forty Years, among the *Turks* and others at *Constantinople*.

That altho' at first the more prudent were very cautious in the use of this Practice; yet the happy Success it has been found to have in thousands of Subjects for these eight Years past, has now put it out of all suspicion and doubt; since the Operation having been perform'd on Persons of all Ages, Sexes, and different Temperaments, and even in the worst Constitution of the Air, yet none have been found to die of the *Small-Pox*; when at the same time it was very mortal when it seized the Patient the common way, of which half the affected dy'd. This he attests upon his own Observation.

Next he observes, they that have this Inoculation practised upon them, are subject to very slight Symptoms, some being scarce sensible they are ill or sick; and what is

is valued by the Fair, it never leaves any Scars or Pits in the Face.

The Method of the Operation is thus. Choice being made of a proper Contagion, the Matter of the Puſſules is to be communicated to the Person proposed to take the Infection; whence it has, metaphorically, the name of Infition or Inoculation. For this purpose they make choice of some Boy, or young Lad, of a sound healthy Temperament, that is feized with the common *Small-Pox* (of the distinct, not Flux sort) on the twelfth or thirteenth day from the beginning of his Sickneſſ: they with a Needle prick the Tubercles (chiefly thoſe on the Shins and Hams) and press out the Matter coming from them into ſome convenient Vessel of Glass, or the like, to receivc it; it is convenient to wash and clean the Vessel firſt with warm Water: A convenient quantity of this Matter being thus collected, is to be ſtop'd close, and kept warm in the Bosom of the Person that carries it, and, as ſoon as may be, brought to the place of the expecting future Patient.

The Patient therefore being in a warm Chamber, the Operator is to make ſeveral little Wounds with a Needle, in one, two or more places of the Skin, till ſome drops of Blood follow, and immediately drop out ſome drops of the Matter in the Glafs, and mix it well with the Blood iſſuing out; one drop of the Matter is ſufficient for each place prick'd. These Punctures are made indifferently in any of the fleſhy Parts, but ſucceed best in the Muscles of the Arm or *Radius*. The Needle is to be a three-edg'd Surgeon's Needle; it may likewife be perform'd with a Lancet: The custom is to run the Needle tranſverſe, and rip up the Skin a little, that there may be a convenient dividing of the Part, and the mixing of the Matter with the Blood more easily perform'd; which is done, either with a blunt Stile, or an Ear-picker: The Wound is cover'd with half a Walnut-shell, or the like Concave Vessel, and bound over, that the Matter be not rub'd off by the Garments; which is all

removed in a few Hours. The Patient is to take care of his Diet. In this place the Custom is to abstain wholly from Flesh and Broath or 20 or 25 days.

This Operation is perform'd, either in the beginning of the Winter, or in the Spring.

Some, for caution, order the Matter to be brought from the Sick by a third Person, lest any infection should be convey'd by the Cloaths of the Operator; but this is not material.

As to the Process of this Matter, in respect of the *Idiosyncrasie*; the *Small-Pox* begins to appear sooner in some than in others, in some with greater, in others with lesser Symptoms; but with happy Success in all. In this Place the Efflorescence commonly begins at the end of the seventh day, which seems to favour the Doctrin of *Cries*.

It was observ'd, in a Year when the common *Small-Pox* was very mortal, that those by Incision were also attended with greater Symptoms. Of 50 Persons, who had the Incision made upon them almost in the same day, four were found in whom the Eruption was too sudden, the Tuberles more, and Symptoms worse. There was some suspicion, that these four had caught the common *Small Pox* before the Incision was made. It is enough for our present purpose, that there was not one but recovered after the Incision: In those four the *Small-Pox* came near the confluent sort. At other times the inoculated are distinct, few and scatter'd; commonly 10 or 20 break out; here and there one has but 2 or 3, few have 100: There are some in whom no Pustule rises, but in the Places where the Incision was made, which sivell up into purulent Tuberles; yet these have never had the *Small-Pox* afterwards in their whole Lives; tho' they have cohabited with Persons having it.

It is to be noted, that a no small quantity of Matter runs for several days, from the place of the Incision.

The Pocks arising from this Operation are dry'd up in a short time, and fall off, partly in thin Skins, and partly
con-

contrary to the common sort, vanish by an insensible wasting.

The Matter is hardly a thick *Pus*, as in the common, but a thinner kind of *Sanies*; whence they rarely pit, except at the place of the Incision, where the Cicatrices left are not to be worn out by time, and whose Matter comes near the nature of *Pus*.

If an Aposteme breaks out in any (which Infants are most subject to) yet there is nothing to be fear'd, for it is safely heal'd by Suppuration. If any other Symptom happens, 'tis easily cur'd by the common Remedies.

Observe, they scarce ever make use of the Matter of the Incisious Pox for a new Incision. If this Inoculation be made on Persons who have before had the *Small-Pox*, they find no alteration, and the places prick'd presently dry up; except in an ill Habit of Body, where possibly a slight Inflammation and Exulceration may happen for a few days.

To this time, he says, I have known but one Boy, on whom the Operation was perform'd, and yet he had not the *Small-Pox*, but without any mischief; and some Months after catching the common sort, he did very well. It is to be observ'd, that the places of the Incision did not swell. I suspect this Child prevented the insertion of the Matter, for he strugled very much under the Operation, and there wanted help to hold him still. The Matter to be inserted will keep in the Glass very well for 12 Hours. He goes on.

I have never observ'd any mischievous Accident from this Incision hitherto; and altho' such Reports have been sometimes spread among the Vulgar, yet having gone on purpose to the Houses whence such Rumors have arisen, I have found the whole to be absolutely false.

It is now eight Years since I have been an Eye-witness of these Operations; and to give a greater Proof of the Sedulity I have used in this Disquisition, I shall relate two Historics.

There was, in a certain Family, a Boy of 3 Years old, afflicted with the *Falling-Sickness*, the *King's-Evil*, an *Hereditary Pox*, and a long *Maraasmus*. The Parents were desirous to have the Incision made upon him; the *Small-Pox* were thrown off with ease; about the 40th day he dy'd of his *Maraisme*. In another Family, a Girl of 3 Years old, troubled with the like Fits, strumous, attended with an *Hereditary Lues*, and labouring under a colliquative Loosness for three Months. The Operation was perform'd on this Child; she came off very well of the *Small-Pox*, which was all over the 15th day; on the 32d she dy'd of her Looseness, which had never left her the whole time.

But it is true, I never maintain'd the Inoculation as a *Panacea*, or Cure for all Diseases; nor do I think it proper to be attempted on Persons like to die. Some more quick-sighted, imagin'd these two Children were, as useless Shades, sent to *Charon* by any means that could be made use of. If I could have collected any more concerning this Matter, I should have imparted it candidly.

The rest of Dr. *Timone's* Letter contains his Reasons for this Method of Practice; which being the *Aetiological Part*, is publish'd in his own Words, as follows.

ÆTIOLOGIA.

Contagium *Variolarum* per puris infusionem propagari hanc quidem mirabitur qui *Æsculapii templum* vel à primo lamine salutavit, & fermentationis doctrinam subodoratus est: Nec obscurior est infestationis modus, qudm panificium, aut ars cerevisaria, in quibus ex admixto fermento massa fermentanda turgescunt; conciliatio nimirum motu intestino minimarum particularum principiis astringe polientum. Si quis querit interim cur variolæ periculose alioquin & persæpe lethales, ex infestatione sine ullo periculo excludantur. Dico: Variolæ communes vel concurrente pravâ aliquâ speciali aeris diathesi suscitantur, vel ab effluviis à variolis so-

cor-

corpore emanantibus per contagium propagantur. Primus casus in paucis individuis accidit, & concurrente quidem vel insigni cacochemia, vel saltem varioloso seminit in talibus individuis latitantis acerrimam exaltatione: Secundus casus communissimus est. In primo casu miasma malignum aereum, in secundo virulenta contagii corpuscula indolis (probabiliter) salino-sulphurea sed specificam fracedinem suam ranciditatem nocta statim ac per respirationem hauriuntur spiritus ipsos, & labe quidem tetrorema inficiunt; subsequenter autem massam sanguineam & lympham vitiari manifestum est. Spiritus statim infici rationi consentaneam est, tum quia in fontes spirituum, cor scilicet & cerebrum, statim ingressum habent virulentem aporriæ, tum ratione analogismi inter miasmata & effluvia ista ipsosque spiritus, cum utraque spirituoso-aerea textura sint. Deducitur etiam cito & prava spirituum infectio à tot tantisque norvosi systematis symptomatibusque, quæ malas plerumque comitantur variolas, & præcipue à convolutionibus epilepticis quæ infantibus accidenti ipso momento, quo varioloso inficiuntur contagio multo antequam febris illos corripiatur. Massam autem sanguineam inquinari praeter febrem purulenta tuberculorum exclusio testatur. Lymphæ vero vitiæ fidem faciunt glandularum in faucibus tumor, screatus, & enormis multities pyralismus. Inter hac circularis etiam sequitur noxa. Sed præcipue sanguinis particula ab indebita spirituum irradiatione in plures ataxias & anomalias perducuntur. Duobus tamen potissimum modis in variolis communibus mortem contingere observavi.

Primus est quando paucis erumpentibus variolis, & tardè ad maturitatem procedentibus, mala alia oborintur symptomata; secundus quando nimia tuberculorum copia cadaverosam putredinem inauicit. In primo casu malignæ vulgo dicuntur variola: causa autem est vel nimia fuso & dissolutio massa sanguinea, vel ejusdem coagulatio & grumescens. Si enim impetus spiritum explosivus justo plus auzeatur, particula massa sanguinea nimium ad invicem atteruntur, comminuantur, & tenuissimas nanciscuntur acrotas: sanguis in hoc statu sollertis naturæ mechanismum eludit, cumque nil faculentiioris in glandulis secretoriis cribrisque deponat, aconomie animalis functionibus requisitas filtrationes & transcolati-

ones celebrari haud patitur: improportionata etenim est figura particularium liquidi ad configurationem pororum in tubulis & colatoris ratione subtilitatis nimiae: filtratione enim defacarentur particulae sanguinis si naturalem servarent schematismum & momen: hinc dicitur pepsm fieri per incrassationem. Prater hoc celeritas ipsa transitus sanguinis in causa est ut nihil deponatur in colatoriis. Torrens ubi nimio impetu & precipiti cursu fertur aquas turbidas defacari haud patitur; quia vis centripeta gravitatem admixti terrei sequens superatur a fortiorum pulsoria virtute aqueorum globulorum rapide ruenium: virtus enim fortis, verbi gratia, ut unum non poterit lineam perpendicularem describere ubi virtus fortis ut duo ad lineam horizontalem protrudit: sic etiam haud pluit vento flante intensissimo; eadem geometrica proportione (probabiliter loquendo) sanguinis particulae aucto ab effrānibus spiritus motu, tubulos colatorios præterflunt nullā factā facūm de positione. Hec probabilia fūnt à summa pulsū celeritate, febre intensissima, sudore nullo, & urina cruda. E contra quandoque contingit ut ab acuis, & scindentibus deleterii fermenti particulis frangatur, corredatur, vel saltē relaxetur elater spirituum: elangescēte igitur spirituum motu torpidiores etiam hebetioresque fūnt sanguinis lymphaeque particulae: igitur dum in labyrinthis tubolorum anfractibus moram indebitam contrabunt alias turmatim invicem complicari, alias autem, congestione factā, super alias incidere, & diverso ad invicem superficerum suarum contactu à naturali configuratione desciscere, & novas induere angularum dimensiones necesse est. Sic igitur diversa ab illa, quam superius narravimus, figurarum ad tubolorum meatus improportione, partamen calmitatis eventu dædaleæ naturæ machinationes irritas fieri contingit: Hec probabilia fūnt à pulsu tardo & raro, ac febris carentia quandoque in summa malignitate observatis, paucis & tardè erumpentibus voriolarum pustulis. Ulterius à trepidatoria, sū suſultoria ac tumultuosa furentium spirituum irradiatione in-equalis eodem tempore in diversis partibus masse sanguineæ, & arteriarum etiam venarumque contingere potest impulsus. Sive igitur fibrillæ aliquæ (ut quidem volunt) reperiantur in sanguine, seu chili nondum bene assimilati sint portiones usib[us] peculiaribus dicata-

dicatae; probabiliter istarum motum turbari contingit: has enim in circulatorio motu secundum longitudinem suam naturaliter moveri necesse est: ab inaequali autem pressione dicta rectilineam figuram perdere, & in spiras ac semicirculos crispari coguntur: has igitur sic contortas transversaliter postmodum in circulatione raptari, ad invicem implicatas convolvi, & ramosis schematibus abortis, racematis adeo conglobari necesse est, ut in majusculis tandem grumos coalescant, sive denum fibrilla illa non dentur, ceriè cujuscumque figurae sint massa sanguineæ particulæ, illas à naturali desciscere situatione ex hac motu inaequalitate contingit: Confusa igitur particula ista & ad invicem implicatae statim vehiculi sui, seri scilicet globulis per expressionem à suo contubernio explosis, majorem, ratione molis auctæ gravitatem nanciscuntur, ideoque impulsuæ circulatoriæ facultatis vim superant: Has igitur hic illic restitare ac stagnare necesse est, prout in hoc vel illo loco prima mutua cohaesio forte contigerit: Hinc livida stigmata, & simul (quod saepè observavi in variolis cum petechiis erumpentibus) frequens sequitur mictus, quo limpidissimum serum in magna copia excluditur. Enfusio, & coagulatio. Hinc mirum non est cur moriantur aliqui in variolis cum petechiis, convolutionibus syncope, vigiliis nimiis, emorrhagiis, delirio, vomitis, enormibus, dysenteriis, &c. quamvis haud multa pustularum putrilagine perfundantur: In stygium enim veluti characteristum variolarum fermentum multoties evicitur, ita ut quamvis haud magnam crassi puris copiam progignere aptum sit, spiritibus tamen, liquidis & solidis suprarecentia mala modis vel explicatis vel aliis consimilibus communicare possit, sicque mortem inferre; & hoc ante undecimum plerumque. Veniamus nunc ad secundum modum. Diversa enim aliquando contingit pernicies & longè alterius generis tragœdia: quamvis enim absint illa symptomata, nimia tamen puris, materiae scilicet cadaverisatae, copia corpus obruitur. Pus autem generari probabile est quando sulphureis oleofisque masse sanguineæ particulis in fracedine & fusione constitutis acidofluminarum particularum coaffusio contingit. Huic asserto faciem accendent innumera chymica experimenta quibus manifestè edocemur solutionibus pinguium sulphureorum per alkalia factis acido qual-

bet coaffuso statim massam albicantis coloris emergere. Multoies igitur miasma seu fermentum variolarum per respirationem hau-
stum ratione indolis propriæ acerrime & fortassis septice tales in
massam sanguineam particularum acido-salinarum & oleoso-sulphurea-
rum producere potest combinationes, ut non seminia solum vario-
larum, que omnibus individuis (mole tamen minima) à nativi-
tate indita sunt, agitentur, actuentur, & in purulentam abeant
putrilaginem, sed massa ipsa sanguinea tota acorem contrahat, &
motu quodam corruptorio putrescat & cadaverisetur. Sic igitur,
incendio veluti cohorto, ulterius furere fermentescentes particulas
contingit, quam variolosis seminiis per despumationem eliminandis
opus sit: hic motus non est depuratorius heterogeneis secernendis
inserviens, sed destrutivus & corruptorius, fermento nempe mas-
sam totam superante & invertente; fracidis scilicet rebellibusque
particulis victoria potitis, & omnes alias in sua castra migrare
cogentibus. Hoc manifestè observamus in variis potulentis, in
quibus fermentatione aliquando excitata, motus succedit corrupti-
vus liquores totaliter vitians: hinc videmus aliquos quamvis su-
prarecensitis symptomatis immunes, immenso tamen, ut ita di-
sam, putredinis oceano suffocatos: Et hoc periculum usque ad vi-
gissimum secundum protrahitur. Ultimo loco considerandum solida
etiam & nobiliores partes in hisce casibus pessime affici, & in
spasmos inordinatos fieri: variis horum distortionibus tubolorum
meatus vitiari, at functionum munera depravari necesse est. Ecce
igitur continentia, contenta, & impetum facientia, quorum tri-
umvirata humani corporis respublica regitur, una eademque ruina
ut plurimum involuta: mirabiturne quispiam malorum inde Ilia-
dem in hominis perniciem pullulare? Observandum ulterius mul-
tis, qui peste laboraverint, e communibus variolis etiam post annum
correptis bubones eosdem intumuisse, qui antea in peste eruperant:
nonne hoc etiam summam malignitatem testatur. Infisionem mo-
do ad rationis trutinam revocemus. At hercule longe aliter in
hoc contagionis modo rem procedere quis est qui non fateatur?
Primum enim Spiritus nullatenus infici manifestum est: deinde
non lymphæ, non sanguini labes illa teterrima inuritnr, non soli-
dis viuum aliquod communicatnr. Hinc symptomata omnia le-
via

via, nulla pessima, nulli infantibus epileptici insultus. Contagiosus enim hujuscē fermentum non spiritale, non aereum & acutum est, sed humorale, iners, ac pigrum: venena autem quo subtiliora eo pejora: Ratione igitur improportionis nulla inter fermentum hoc & spiritus esse poterit lucta. Pus equidem variolarum in ipsa substantia sanguini immediatē infusum statim in largum veluti pelagus exceptum diluitur, involvitur, absorbetur, obtunditur: sic illud mitescit, sic in mansuetiorem indolem cicuratur. Contagiosæ istæ particulae sanguinem ingressæ statim sibi congeneres variolosi seminii particulas sanguini à nativitate inditas inveniunt; iis igitur confermentescunt, sed invicem combinatae ac complexæ band amplius sui juris sunt ut ulteriores excitant turbas, regiam vitæ petant, spirituum thesauros diripient; nam mutuis compedibus constrictæ fixantur, præcipitantur, crassioresque & hebetiores fiunt, quam antea fuerint. Statim igitur volubilioribus aquearum particularum globulis tamquam aptis vehiculis superincumbentes, sanguinis motu à centro ad peripheriam tendente, secundo veluti amne, ad ambitum corporis protruduntur, eliminantur. Nonne manifestè videmus haud pus generari in infititiis variolis, sed saniosam, dilutiorem videlicet aqueamque magis materiam? Nonne ex hoc phænomeno palam est acido-salinas fermenti contagiosi particulas haud oleosas passim sanguinis particulas in cadaverosam purulentiam pervertere, sed blandioribus potius laevioribusque aqueis particulis easdem dilutas & saturatas foras asportari? Ex negatione fovearum & cicatricum nonne manifestum est acres, aculeatas, pungentes & corrosivas salini fermenti particulas à balsamicis statim sanguinis globulis obtundi, spiculis suis orbari, & hebetiori figura modificatas, vi veluti mochlica, extra propelli? Integra interim servatur massæ sanguineæ textura, inviolata consistentia. Nullam hinc vides fusionem, nullam grumescitiam, nullum corruptorium aut destructivum motum. In infitione enim tantum solummodo sanguis fermentescit, quantum impuro à puri consortio separando, ac per despumationem extrudendo satis est. In hoc fermentationis motu solum per undulationem quandam leviter aliquando afficiuntur spiritus, lympha, & solidæ partes, & siue ad ista

contagii particulae perveniunt, certè (quod infestationis adumbrat metaphora) non nisi sylvestri acrimonia private, ac veluti dulcificate pervenire possunt. Hec tenuitatis meæ satis conscius hujus prædicta fronte obtrudo: non me latet longè meliora eminatura ab illis, queis meliore luto finxit præcordia Titan: In historica tamen infestationis hujuscce narratione aliquatenus me bene meritum spero.

*Constantinopoli, Anno 1713.
Mense Decembre..*

Emanuel Timonius, Constantopolitanus. In Universitatibus Oxoniensi & Patavina Philosophiae & Medicinae Doctor.

VI. *Theoremata quadam infinitam Materię Divisibilitatem spectantia, que ejusdem raritatem & tenuem compositionem demonstrant, quorum ope plurimæ in Physica tolluntur difficultates.*

A Johanne Keill, M. D. Profes. Astron. Savil. Oxon. & S. R. S.

J AMDUDUM sequentia Theoremata in lucem emisi, omissis quidem Demonstrationibus, eo quod arbitrabar eas, ut pote non admodum involutas, à quovis in Geometriâ, vel etiam in Arithmeticâ mediocriter versato, facile elici potuisse; Sed quoniam video, D. Christianum Wolfum in Academiâ Fredericianâ Mathematum Professorem, reliquosque Actorum Lipsiensium Authores, hæc Theoremata non rectè intellexisse, cumque eorum in Philosophiâ explicandâ usus non sit exiguis; libet ea nunc denuo, adjectis Demonstrationibus, Reipublicæ Philosophicæ impertiri.

Suppono Materiam omnem divisibilem esse in infinitum, eamq; posse formam quamcunque seu figuram induere, & ad quamcunque tenuitatem, seu crassitudinem quamcunque exiguam reduci.

Lemma
