Key Word Index—Sciadopitys verticillata; Sciadopityaceae; seed; chemotaxonomy; diterpenes; labdane.

Abstract—Thirteen new labdane-type diterpenes have been isolated from the seeds of *Sciadopitys verticillata* together with six known ones, sciadin, sciadinone, dimethyl sciadinonate, lambertianic acid and its methyl ester and *trans*-communic acid. Their structures have been determined by chemical and spectral methods.

INTRODUCTION

Sciadopitys verticillata Sieb. et Zucc., endemic to Japan, is a sole species belonging to the family Sciadopityaceae. In earlier studies on the terpenoid constituents of this species, sciadin (1) [1], methyl sciadopate (2) [2], sciadinone (3), dimethyl sciadinonate (4) [3] and verticillol (5) [4] were isolated from the leaves or heartwood. Our present examination of the seed extract led to the isolation of a number of diterpenes, including 1, 3 and 4. This paper describes the structural elucidation of these diterpenes. In addition, the configurations at C-12 and C-20 of sciadin which had been proposed by Sumimoto [5] are discussed.

RESULTS AND DISCUSSION

The hexane extract of the seed which had been shown to contain no detectable amount of mono- and sesquiterpenes by GC analysis was treated with methanol to remove triacylglycerols and the methanol soluble portion was further fractionated into an acidic and a neutral parts.

Two diterpenes isolated from the acidic part after chromatographic separation were readily identified as trans-communic (6) and lambertianic acids. Four of the 17 diterpenes isolated from the neutral part were identified as 1, 3, 4 and methyl lambertianate (7) by comparison of their physical and spectral data with the published data.

The remaining 13 neutral compounds were new labdane-type diterpenes and their structures, now represented by the chemical formulae 8-13, 17-19, 21a, 22a, 23a and 24a, were established as follows.

The new diterpenes, except for 23a and 24a, showed common spectral features with those of 4 and 7; that is, IR absorption bands at about 1725, 1160 and 900 cm⁻¹ and proton resonances due to two methyl groups $[ca \delta 1.2]$ and 3.6 (each s) and an exocyclic methylene group $[\delta 4.3-5.0]$ (2H, two s, br) (Table 1). Hence, these compounds each have a labdane skeleton with an exocyclic methylene at C-8, and 4α -methyl and 4β -methoxycarbonyl groups.

Among them, compounds 8 ($C_{21}H_{28}O_4$, mp 81–82°, $[\alpha]_D$ –6.5°), 9 ($C_{21}H_{26}O_5$, mp 108–109°, $[\alpha]_D$ –12.0°) and 10 ($C_{23}H_{30}O_6$, an oil, $[\alpha]_D$ –6.5°), also in common with 4, each contained a furan ring conjugated with a carbonyl group as shown by UV absorption maxima at 203 and 250 nm, an IR carbonyl absorption band at 1660–1675 cm⁻¹, an intense mass spectral ion at m/z 95

arising from fragment A and three aromatic proton signals at $\delta 6.7$, 7.4 and 8.0 in the ¹H NMR spectra. Further comparison of their IR and ¹H NMR spectra with those of 4 indicated that the methoxycarbonyl group at C-10 in 4 was replaced by a methyl group (δ 0.59) in 8, by an aldehyde group $[v_{\text{max}} 2752, 1710 \text{ cm}^{-1}; \delta 9.73 \text{ (1H)}]$ in 9 and by an acetoxymethyl group $[v_{\text{max}} 1745, 1240 \text{ cm}^{-1}; \delta 3.99 \text{ (2H, ABq), } 2.08 \text{ (3H, s)}]$ in 10. Thus 8-10 were methyl 12-oxo-lambertianate, methyl 12,20-dioxomethyl lambertianate and 20-acetoxy-12-oxolambertianate, respectively. The former two compounds were isolated for the first time from a natural source, although 8 had been known as an intermediate in the synthesis of 7 by Bell et al. [6], and 9 as one of the compounds derived from 1 by Sumimoto [1].

Compounds 11 ($C_{21}H_{28}O_4$, an oil, $[\alpha]_D + 36.2^\circ$) [7], 12 ($C_{22}H_{30}O_5$, an oil, $[\alpha]_D + 0.4^\circ$) and 13 ($C_{23}H_{32}O_5$, mp

 $81-83^{\circ}$, $[\alpha]_D + 79.4^{\circ}$) each contained a furan ring as shown by a positive Ehrlich's test and three aromatic proton signals in their ¹H NMR spectra, but the furan ring was not conjugated with a carbonyl group because of the UV absorption maximum at 200 nm and the lack of an enone carbonyl absorption in the IR spectra. The ¹H NMR spectra of 11 and 12 indicated the presence of an aldehyde group (δ 9.65) and a methoxy carbonyl group $(\delta 3.52)$, respectively, suggesting 11 and 12 were methyl 20oxolambertianate and dimethyl 12-deoxo-sciadinonate. This was confirmed by the conversion of 11 and 12 into an identical diol (14) [7] on reduction with lithium aluminium hydride. On the other hand, 13 showed the presence of an additional tertiary methyl group ($\delta 0.51$) to that at C-4 (δ 1.19) and a secondary acetoxyl group [v_{max} 1740, 1240 cm⁻¹; δ 5.74 (1H, dd), 2.03 (3H, s)]. This suggested that 13 was an acetoxyl derivative of 7. The acetoxyl group was shown to be located at C-12 by the significant downfield shift of the signals of the two protons on the furan ring, H-14 and H-16, by 0.14 and 0.22 ppm each, as compared with those of 7. On mild hydrolysis, 13 gave an alcohol which was identical to one of two epimeric alcohols (15 and 16) obtained from 8 by reduction with sodium borohydride. Bell et al. reported the synthesis of the two alcohols and determined the configurations of the hydroxyl groups mainly on the basis of a consideration of the ¹H NMR spectra [6]. The alcohol obtained from 13 was identical with the 12R-hydroxyl derivative, 15, in all respects. Thus, 13 was established as methyl 12R-acetoxylambertianate.

Compounds 17 ($C_{21}H_{32}O_5$, mp 120–121°, $[\alpha]_D$ +45.3°), 18 ($C_{22}H_{30}O_6$, an oil, $[\alpha]_D$ +16.7°) and 19 ($C_{23}H_{32}O_6$, an oil, $[\alpha]_D$ +34.1°), had no furan ring absorption bands in their spectra. Instead, their IR and ¹H NMR spectra displayed a carbonyl stretching band about 1750 cm⁻¹ and two mutually coupled proton resonances about δ 7.0 (1H) and 4.7 (2H), in common. These spectral features coupled with a positive Legal test suggested that each of the three compounds contained an α -substituted butenolide moiety in the side chain of the molecule, as in pinusolide (20) [8]. Furthermore, their ¹H NMR spectra indicated the presence of an aldehyde group (δ 9.65) in 17, an additional methoxycarbonyl group (δ 3.52) to that at C-4 (δ 3.57) in 18 and an acetoxymethyl

group $[\delta 3.92 (2H, s), 1.99 (3H, s)]$ in 19. These compounds were, therefore, deduced to be C-20 oxygenated derivatives of 20, and the structures were represented by formulae 17-19, respectively.

As compounds 21a and 22a were not separated from each other by chromatography on silica gel, they were isolated as the corresponding monoacetates, 21b and 22b. Both the acetates had the same molecular formula, $C_{24}H_{32}O_8$, and the same structure as 12 except for the furan ring, as shown by their mass and ¹H NMR spectra. The presence of an α -substituted γ -acetoxybutenolide moiety [9] in 21b and of a β -substituted one [10] in 22b was revealed by the IR absorption band at 1780 cm⁻¹ (butenolide) and two proton signals ascribed to oxygen atom-bearing olefinic and methine groups [21b: $\delta 6.84$ (2H); 22b: δ6.77, 5.93 (each 1H)]. Their ¹³C NMR spectra (Table 2) revealed that 21b and 22b were a mixture of the 15- and 16-epimers, respectively, because several carbon signals of the acetates appeared as double lines. Verification of the structures was provided by the fact that when 12 in methanol was exposed to sunlight for 20 days it gave a mixture of 21a and 22a, as was expected [11].

The last two compounds, 23a (an oil, $[\alpha]_D - 27.6^\circ$) and 24a (an oil, $[\alpha]_D - 7.8^\circ$), each having a molecular formula of $C_{20}H_{24}O_6$, were shown by their ¹H and ¹³C NMR spectra to have the same partial structure as 1 except for the furan ring. Upon acetylation, 23a and 24a each gave two monoacetates (23b and 23b'; 24b and 24b'), which were presumed to be mixtures of epimers concerning the acetoxyl group because of the close similarities of the ¹H NMR spectra between 23b and 23b' and between 24b and 24b'. Similarly as in the case of 21a and 22a, the presence of a α-substituted γ-hydroxy-butenolide in 23a and of a β -substituted one in 24a was also suggested by the IR spectra (23a: 3350, 1770 cm⁻¹; 24a: 3300, 1770 cm⁻¹) and chemical shifts of two proton signals (23a: δ 7.19, 6.16; **24a**: δ 6.20, 6.08) as well as the effects of acetylation on the chemical shifts. In contrast with the case of 12, 1 did not give any products by photolytic oxidation under the same condition, but this fact showed that, at least, 23a and 24a were not artifacts formed from 1 during the isolation procedure.

As for the configurations at C-12 and C-20 of 1, Sumimoto demonstrated them to be 12S and 20S on the basis of the fact that, in the ¹H NMR spectra of 1 and its 8(17)-dihydro and 8-oxo derivatives, the chemical shifts of both H-12 and H-20 were largely effected by functional groups at C-8, supporting the stereostructure, **B** [5]. On the other hand, Bell reported an effect of a hydroxyl group at C-12 of labdane-type diterpenes on the chemical shift of exocyclic methylene protons at C-17 [12], and thus we attempted to establish the configurations according to Bell's consideration.

Sodium borohydride reduction of a lactol acetate, 25, prepared from 1 in the manner described by Sumimoto [1], afforded two epimeric alcohols, 26 and 27, in a ratio of 5:7. On the basis of the arguments of Bell, 27 was deduced to be 12S-hydroxyl derivative, because one of the exocyclic methylene protons underwent a downfield shift by 0.25 ppm as compared with that of 26 in the ¹H NMR spectra. Upon hydrolysis, 27 gave 1 together with sciadinic acid (29) [1] which gradually changed to 1 on standing, while 26 gave a stable lactol, 28, as a sole product. Thus, the configuration of C-12 was confirmed as 12S. The cis relationship between H-12 and H-20 of 1 was established by the NOE measurement in the ¹H NMR:

¹³C NMR spectral data for compounds 9 and 11: see ref. [7].

*Listed for comparison.

†Assignments may be interchanged.

†The signals appear as double lines because the compounds existed as C-15 or C-16 epimeric mixtures.

irradiation at H-20 (δ 5.50) revealed an NOE enhancement (26%) on H-12 (δ 5.02). Consequently, the stereostructure **B** for 1 as well as **23a** and **24a** was confirmed.

Finally, the proposed structures for the above compounds were also confirmed by their ¹³C NMR spectra (Table 2), in which shift assignments were based on the multiplicities in the off-resonance spectra at single frequencies and recognition of proper substituent effects [13, 14].

EXPERIMENTAL

Mps: uncorr; 1 H NMR (100 MHz) and 13 C NMR (25.15 MHz): CDCl₃ containing TMS as an internal standard; GC: 5% OV-17 on Uniport KS (2 m × 3 mm), temp. 80– 330° at 5° /min, N₂ 60 ml/min.

Extraction. Seeds (900 g), collected in Wakayama prefecture, Japan, in 1979, were ground and extracted with hexane (2.5 l. \times 2) and MeOH. The hexane extract (328 g) was treated with MeOH (150 ml \times 3) in order to remove acylglycerols and the MeOH soluble part (29 g) was further fractionated into an acidic (1.5 g) and a neutral (27 g) part by treatment with 5% Na₂CO₃.

Trans-communic (6) and lambertianic acids from the acidic part. The acidic part was chromatographed on a silica gel column eluting with EtOAc- C_6H_6 (1:8). The least polar fraction (35 mg) was further purified by prep. TLC (layer thickness: 0.75 mm; Et₂O-hexane, 1:4) to give 6 (10 mg, R_f 0.65), an oil, $[\alpha]_D + 38.0^\circ$ (c 0.6, EtOH) and lambertianic acid (16 mg, R_f 0.60), mp 127-128° (from pentane), $[\alpha]_D + 44.5^\circ$ (c 0.97, CHCl₃).

Fractionation of the neutral part. The neutral part (6.4 g) was chromatographed on a silica gel column (33 × 4 cm) eluting with increasing amounts of EtOAc in hexane and fractions of 500 ml each were collected. The first fraction eluted with 10% EtOAc (630 mg) was further chromatographed on a silica gel column (Et₂O-hexane, 1:10) to give 7 (11 mg) as an oil, identical to the Me ester of lambertianic acid in all respects (TLC, MS and ¹H NMR), and triacylglycerols.

Isolation of methyl 12-oxo-lambertianate (8), methyl 12Racetoxy-lambertianate (13), methyl 20-oxo-lambertianate (11) and dimethyl 12-deoxo-sciadinonate (12). The second fraction (947 mg) eluted with 15 % EtOAc was subjected to repeated silica gel column chromatography (Et₂O-hexane, 1:3; EtOAc-C₆H₆, 1:20; CHCl₃) to afford 8 (40 mg), 13 (280 mg), 11 (47 mg) and 12 (520 mg). 8: mp 81-82° (pentane), $[\alpha]_D - 6.5^\circ$ (c 0.61, CHCl₃); UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ε): 203 (4.15), 250 (3.61); IR $\nu_{\text{max}}^{\text{KBr}}$ cm⁻¹: 3125, 1563, 1515, 873 (furan), 1660 (C=O), 890 (>C=CH₂), 1720, 1156 (ester); MS m/z (rel. int.): 344 [M]⁺ (48), 285 (14), 284 (16), 235 (60), 234 (100), 175 (45), 121 (77), 95 (97). 13: mp 81-83° (pentane), $[\alpha]_{D}$ + 79.4° (c 0.63, CHCl₃); UV λ_{max}^{EOH} nm (log ϵ): 202 (4.07); IR ν_{max}^{KBr} cm⁻¹: 3130, 1501, 874 (furan), 3085, 894 $(>C=CH_2)$, 1740, 1240 (acetate), 1725, 1150 (ester); MS m/z (rel. int.): 388 [M]+ (3), 329 (92), 323 (100), 269 (32), 121 (43), 81 (15), 43 (22). 11: an oil, $[\alpha]_D$ + 36.2° (c 0.58, CHCl₃); UV λ_{max}^{EtOH} nm (log ε): 202 (4.20); IR $v_{\text{max}}^{\text{neat}}$ cm⁻¹: 3135, 1503, 874 (furan), 3080, 1640, 894 (>C=CH₂), 2750, 1705 (CHO), 1720, 1160 (ester); MS m/z (rel. int.): 344 [M] + (98), 316 (30), 313 (23), 255 (20), 175 (60), 161 (66), 81 (100). 12: an oil, $[\alpha]_D + 0.4^\circ$ (c 0.53, CHCl₃); UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ε): 202 (4.00); IR $\nu_{\text{max}}^{\text{neat}}$ cm⁻¹: 3135, 1503, 874 (furan), 3080, 1644, 894 (>C=CH₂), 1730, 1200 (ester); MS m/z (rel. int.): 374 [M] + (80), 324 (43), 314 (100), 255 (47), 173 (27), 161 (38), 81 (34).

Isolation of methyl 12,20-dioxo-lambertianate (9), sciadin (1), dimethyl sciadinonate (4) and methyl 20-acetoxy-12-oxo-lambertianate (10). The third fraction eluted with 20% EtOAc (2.9 g) was recrystallized from CHCl₃-hexane to give 1 [530 mg, mp $162-163^{\circ}$, [α]_D + 8.3° (c 3.03, CHCl₃)]. The mother liquor was

subjected to repeated silica gel column chromatography (Et₂O-hexane, 1:1; EtOAc-C₆H₆, 1:10; Me₂CO-CHCl₃, 1:20) to give 9 (178 mg), 4 (356 mg), mp 124-125° (Et₂O-hexane), $\begin{bmatrix} \alpha \end{bmatrix}_D$ – 33.8° (c 0.45, CHCl₃), 10 (1.1 g) and 1 (360 mg). 9: mp 108-109° (pentane); $\begin{bmatrix} \alpha \end{bmatrix}_D$ – 12° (c 1.67, EtOH); UV λ_{\max}^{EtOH} nm (log ε): 203 (4.09), 250 (3.53); IR ν_{\max}^{KBr} cm⁻¹: 3130, 1563, 1518, 873 (furan), 2725, 1710 (CHO), 1670 (C=O), 1725, 1160 (ester), 895 (>C=CH₂); MS m/z (rel. int.): 358 [M]⁺ (6), 221 (21), 220 (14), 161 (24), 160 (27), 95 (100). 10: an oil, $\begin{bmatrix} \alpha \end{bmatrix}_D$ – 6.5° (c 14.1, EtOH); UV λ_{\max}^{EtOH} nm (log ε): 203 (4.12), 250 (3.49); IR ν_{\max}^{toat} cm⁻¹: 3135, 1563, 1510, 875, 745 (furan), 1745, 1240 (acetate), 1675 (C=O), 1725, 1160 (ester), 897 (>C=CH₂); MS m/z (rel. int.): 402 [M]⁺ (1), 342 (5), 329 (9), 311 (18), 251 (21), 173 (27), 159 (53), 95 (100), 43 (43). The fourth fraction (480 mg) eluted with 30% EtOAc gave the same compounds as above, after chromatography.

Isolation of sciadinone (3), 20-oxo-pinusolide (17), dimethyl 15,16-epoxy-16-oxo-labda-8(17),13-diene-19,20-dioate (18) and 20-acetoxy-pinusolide (19). The fifth fraction (542 mg) eluted with 50% EtOAc was subjected to repeated silica gel column chromatography (Et₂O-hexane, 1:1; EtOAc-C₆H₆, 1:8; $Me_2CO-CHCl_3$, 1:80) to give 3 (64 mg): mp 214-215° $(CHCl_3-hexane)$, $[\alpha]_D - 68.8^\circ$ (c 0.32, CHCl₃). 17 (52 mg): mp 120-121° (Et₂O-hexane), $[\alpha]_D$ +45.3° (c 0.38, CHCl₃); UV λ_{max}^{EtOH} nm (log ϵ): 200 (4.17); IR ν_{max}^{KBr} cm⁻¹: 1745 (butenolide), 1700 (CHO), 1725, 1160 (ester), 1640, 905 (>C=CH₂); MS m/z (rel. int.): 360 [M]⁺ (10), 300 (19), 272 (100), 208 (83), 175 (54). 18 (10 mg); an oil, $\lceil \alpha \rceil_D + 16.7^\circ$ (c 1.02, EtOH); UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 200 (4.10); IR $\nu_{\text{max}}^{\text{CHCl}_3}$ cm⁻¹: 1755 (butenolide), 1725, 1200 (ester), 1640, 895 ($>C=CH_2$); MS m/z (rel. int.): 390 [M]⁺ (19), 330 (48), 298 (96), 271 (80), 173 (100), 159 (78), 105 (82), 90 (74). **19** (34 mg): an oil, $[\alpha]_D$ + 34.1° (c 0.40, EtOH); UV λ_{max}^{EtOH} nm (log ϵ): 200 (4.20); IR ν_{max}^{CHCl} , cm $^{-1}$: 1755–1720, 1645, 1240, 1160, 915; MS m/z (rel. int.): $404 [M]^+$ (1), 344 (18), 331 (39), 285 (37), 284 (42), 271 (69), 105 (46), 43 (100).

Isolation of compounds 21b, 22b, 23a and 24a. The sixth fraction (739 mg) eluted with EtOAc was purified by prep. TLC on silica gel (Et₂O-hexane, 5:1). Elution of bands at R₁ 0.43, 0.26 and 0.17 with EtOAc gave a mixture of 21a and 22a (209 mg) [in the ¹H NMR spectrum, two pairs of two proton signals (δ 6.83, 6.07; δ 5.97, 5.81) with a relative intensity of 9:4 were observed], 23a (193 mg) and 24a (154 mg), respectively. After acetylation with Ac₂O-pyridine, the mixture was separated by prep. TLC on silica gel developed three times with CHCl₃ to give 21b (130 mg, R_f 0.55) and 22b (60 mg, R_f 0.47). 21b: an oil, $[\alpha]_D + 7.6^\circ$ (c 1.84, CHCl₃); IR $v_{\text{max}}^{\text{CHCl}_3}$ cm⁻¹: 1780, 1725, 1160, 990, 900; MS m/z (rel. int.): 448 [M] + (18), 389 (54), 388 (30), 356 (31), 329 (42), 328 (38), 296 (77), 268 (99), 267 (100), 173 (73), 172 (45), 159 (58). 22h: an oil, [α]_D + 13.3° (c 0.83, CHCl₃); IR ν CHCl₃ cm⁻¹: 1780, 1725, 1160, 990, 900; MS m/z (rel. int.): 448 [M]⁺ (18), 389 (54), 388 (29), 356 (31); 329 (42), 328 (38), 296 (77), 268 (98), 267 (100), 173 (73), 172 (45), 159 (58), 105 (31). **23a**: an oil, $[\alpha]_D - 27.6^\circ$ (c 2.72, CHCl₃); UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 203 (3.91); IR $\nu_{\text{max}}^{\text{neat}}$ cm⁻¹: 3350, 1770–1730 (broad), 1140, 1080, 1010, 910, 760; MS m/z (rel. int.): 360 [M] (23), 332 (13), 314 (14), 286 (30), 268 (21), 175 (80), 159 (100), 147 (68), 105 (80), 91 (72). **24a**: an oil, $[\alpha]_D - 7.8^\circ$ (c 1.29, CHCl₃); UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 203 (4.18); IR $\nu_{\text{max}}^{\text{neat}}$ cm⁻¹: 3300, 1770–1720, $1640, \overline{1130}, 1080, 960, 900, 740; MS \overline{m/z}$ (rel. int.): $360 [M]^+$ (21), 332 (18), 314 (26), 286 (27), 268 (30), 175 (57), 173 (60), 161 (84), 159 (81), 147 (71), 105 (100), 91 (93). After acetylation with Ac₂O-pyridine followed by chromatography by prep. TLC on silica gel, 23a and 24a each gave two acetates (epimers of an acetoxyl group), 23b and 23b' (2:3) and 24b and 24b' (2:1), as oils.

NaBH₄ reduction of 8. To a soln of 8 (37 mg) in MeOH (10 ml) was added NaBH₄ (4 mg) at room temp. The mixture was stirred for 30 min and diluted with H_2O . After extraction with Et_2O , the

product was purified by prep. TLC on silica gel (EtOAc- C_6H_6 , 1:10) to yield 15 (15 mg, R_f 0.50), an oil, and 16 (17 mg, R_f 0.28), mp 134–135°. Their IR and ¹H NMR spectral data were in good agreement with those reported [6].

Hydrolysis of 13. A soln of 13 (20 mg) in 2 M ethanolic KOH (5 ml) was stirred for 3 hr at room temp. After dilution with H_2O , the soln was extracted with Et_2O . Upon usual work-up, the product was purified on a silica gel column and an alcohol (13 mg) obtained which was identical to 15 in all respects (TLC, IR and ¹H NMR).

Photolytic oxidation of 12. An MeOH soln of 12 (30 mg) in a pyrex flask was exposed to sunlight and the reaction was monitored by TLC. After the disappearance of 12 (20 days), removal of the solvent gave a mixture of 21a and 22a (3:2), identical to natural ones in all respects (TLC, ¹H NMR).

NaBH₄ reduction of 25. To a soln of 25 (118 mg) in MeOH (10 ml) was added NaBH₄ (50 mg) at 0° and the mixture was stirred for 1 hr. Upon work-up, the product was purified on a silica gel column (EtOAc-CHCl₃, 1:4) to give 26 (38 mg) [IR $v_{\text{max}}^{\text{CHCl}_3}$ cm⁻¹: 3500, 1730; ¹H NMR: δ 7.33, 7.28, 6.31 (each 1H, furan), 6.48, 5.07, 4.63 (each 1H, s), 4.58 (1H, d (br), J = 10 Hz), 2.04, 1.21 (each 3H, s)] and 27 (42 mg) [IR $v_{\text{max}}^{\text{CHCl}_3}$ cm⁻¹: 3500, 1740; ¹H NMR: δ 7.37, 7.27, 6.37 (each 1H, furan), 6.48, 5.09, 4.88 (each 1H, s), 4.64 (1H, dd, J = 4 and 11 Hz), 2.14, 1.16 (each 3H, s)].

Hydrolysis of 26 and 27. A soln of 26 (30 mg) in 1 M ethanolic KOH (5 ml) was stirred for 5 hr at room temp. After neutralization with 5% HCl, the product was extracted with Et₂O and chromatographed on a silica gel column (EtOAc-CHCl₃, 1:3) to give 28 (25 mg) [an oil, IR $v_{\rm max}^{\rm CHCl_3}$ cm⁻¹: 3600-3250, 1720; ¹H NMR: δ 7.33 (2H, narrow m), 6.37 (1H, narrow m), 5.89 (1H, br s), 4.99, 4.64 (each 1H, s), 4.62 (1H, dd, J = 2 and 10 Hz), 1.20 (3H, s)]. By the same treatment as above, 27 gave 1 and sciadinic acid

(29), mp 110-112° (monohydrate from aq. MeOH) [1], the latter of which gradually changed into 1 in the CHCl₃ soln.
