Radio Listeners' Guide and Call Book

Edited by S. Gernsback

A Quarterly Magazine

30 DAYS FREE TRIAL

Battery or
All-Electric
OPERATION

HERE is the great value offer of the day. Test and try this powerful seven-tube RANDOLPH RADIO for thirty days. After it **brings in stations from coast to coast** with amazing clearness—**with easy one-dial tuning**—after it **easily equals any other radio** regardless of cost—after you are more than satisfied then you can buy it **direct at factory prices. Every RANDOLPH must make good before it is sold.**

The RANDOLPH SEVEN-TUBE CONSOLE illustrated here can be had for use with batteries or **connected direct to the electric light socket—absolutely batteryless—no batteries, chargers or acids—just plug in and tune in.** 100% efficient either way. Its construction and performance have been tested and approved by leading radio engineers and authorities—by leading radio publications and laboratories.

7 Tubes—Single Control
Illuminated Drum

One drum dial operated by one simple vernier control tunes in all stations with easy selectivity to tremendous volume. No overlapping of stations. Illuminated drum permits operation in the dark. Volume control for finer volume modulation. This is a seven-tube tuned radio frequency receiver with power transformers and power amplification. Space wound solenoid coils. Full and completely shielded. A real receiver of the highest quality. Tremendous distance, wonderful tone quality, simple to operate.

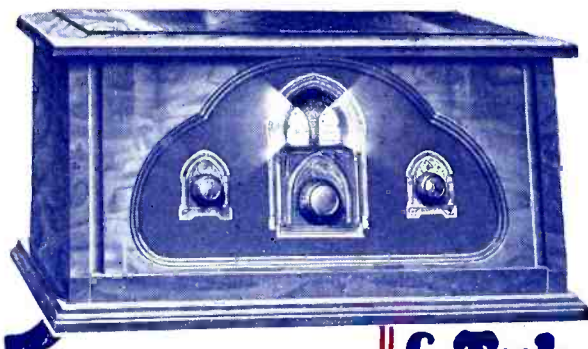
Beautiful Walnut Console
Built-in Cone Speaker

The Randolph Seven-tube Ampliphonic Console illustrated above is housed in a genuine burl-walnut cabinet with two-tone hand rubbed finish giving it unsurpassed beauty. The same expert cabinet work has gone into the making of these consoles as in the finest furniture. Has **built-in cone loud speaker that compares with any on the market.** Accurately reproduces complete range of musical notes from the highest to the lowest pitch.

What Users Say

I have logged more than 50 stations from coast to coast.—Lloyd Davenport, Littlefield, Texas. I have logged 52 stations from Cuba to Seattle, the set is a world beater.—J. Tampkinson, Detroit, Mich. Your set is a revelation, has all others tied to the post for distance and selectivity.—Waldo Powers, Vergennes, Vermont. On strength of its performance sold two more sets this week.—T. Scanlow, Orlando, Florida.

The Randolph 7-Tube Console Single Control RETAIL PRICE Completely Assembled **$99**



The Senior Six

Now you can have a new, modern, single-control, six-tube radio. Do not compare this set with old style 2-dial 6-tube sets selling for about the same price. The Randolph 1928 Senior Six has also been tested and approved by the leading radio engineers.

Comes in a beautiful solid walnut cabinet of hand-rubbed finish. Single control. Illuminated Drum with space for logging. Absolutely dependable and very selective. **Sent for 30 Days' Free Trial. You test it before you buy.**

6-Tube $55 Retail Price Single Control

MAIL COUPON NOW!

The Randolph Radio Corporation are pioneers in the manufacture of radios. All of its vast and unlimited resources have been used in making and perfecting of the Randolph Receivers. Because of our long and successful experience in the radio business, we are perfectly confident in sending out a Randolph Radio on trial. We know what it will do. Mail us the coupon now for the greatest radio offer ever made.

Sensationally Big Discounts to Agents

Work either full or part time and make big money. Tremendous advertising campaign helps you sell. Regardless of whether you have ever sold before, be sure to get our proposition. The Randolph sells on first demonstration. Men and women both can make money this easy way. Get your demonstration set for thirty day's FREE TRIAL.

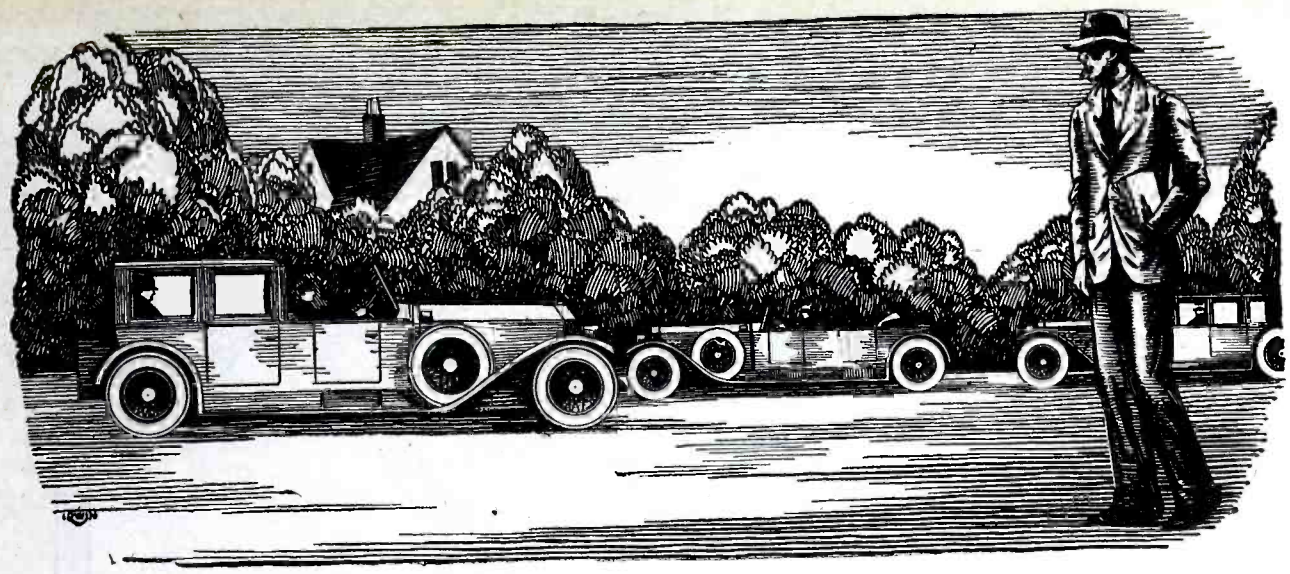
RANDOLPH RADIO CORPORATION
711 West Lake Street Dept. 235 Chicago, Illinois



Many times in the old days, while I trudged home after work to save carfare, I used to gaze enviously at the shining cars gliding by me, the prosperous men and women within. Little did I think that inside of a year, I, too, should have my own car, a decent bank account, the good things of life that make it worth living.

I Thought Success Was For Others

Believe It Or Not, Just Twelve Months Ago I Was Next Thing To "Down-and-Out"

TODAY I'm sole owner of the fastest growing Radio store in town. And I'm on good terms with my banker, too—not like the old days only a year ago, when often I didn't have one dollar to knock against another in my pocket. My wife and I live in the snuggest little home you ever saw, right in one of the best neighborhoods. And to think that a year ago I used to dodge the landlady when she came to collect the rent for the little bedroom I called "home"!

It all seems like a dream now, as I look back over the past twelve short months, and think how discouraged I was then, at the "end of a blind alley." I thought I never had had a good chance in my life, and I thought I never would have one. But it was waking up that I needed, and here's the story of how I got it.

I WAS a clerk, working at the usual miserable salary such jobs pay. Somehow I'd never found any way to get into a line where I could make good money.

Other fellows seemed to find opportunities. But—much as I wanted the good things that go with success and a decent income—all the really well-paid vacancies I ever heard of seemed to be out of my line—to call for some kind of knowledge I didn't have.

And I wanted to get married. A fine situation, wasn't it? Mary would have agreed to try it—but it wouldn't have been fair to her.

Mary had told me, "You can't get ahead where you are. Why don't you get into another line of work, somewhere that you can advance?"

"That's fine, Mary," I replied, "but *what* line? I've always got my eyes open for a better job, but I never seem to hear of a really good job that I can handle." Mary didn't seem to be satisfied with the answer, but I didn't know what else to tell her.

It was on the way home that night that I stopped off in the neighborhood drug store, where I overheard a scrap of conversation about myself. A few burning words that were the cause of the turning point in my life!

With a hot flush of shame I turned and left the store, and walked rapidly home. So that was what my neighbors—the people who knew me best—really thought of me!

"Bargain counter sheik—look how that suit fits," one fellow had said in a low voice. "Bet he hasn't got a dollar in those pockets." "Oh, it's just 'Useless' Anderson," said another. "He's got a wish-bone where his back-bone ought to be."

As I thought over the words in deep humiliation, a sudden thought made me catch my breath. Why had Mary been so dissatisfied with my answer that "I hadn't had a chance?" *Did Mary secretly think that too?* And after all, wasn't it *true* that I had a "wish-bone" where my back-bone ought to be? Wasn't that why I never had a "chance" to get ahead? It was true, only too true—and it had taken this cruel blow to my self-esteem to make me see it.

With a new determination I thumbed the pages of a magazine on the table, searching for an advertisement that I'd seen many times but passed up without thinking, an advertisement telling of big opportunities for trained men to succeed in the great new Radio field. With the advertisement was a coupon offering a big free book full of information. I sent the coupon in, and in a few days received a handsome 64-page book, printed in two colors, telling all about the opportunities in the Radio field and how a man can prepare quickly and easily at home to take advantage of these opportunities. I read the book carefully, and when I finished it I made my decision.

WHAT'S happened in the twelve months since that day, as I've already told you, seems almost like a dream to me now. For ten of those twelve months, *I've had a Radio business of my own!* At first, of course, I started it as a little proposition on the side, under the guidance of the National Radio Institute, the outfit that gave me my Radio training. It wasn't long before I was getting so much to do in the Radio line that I quit my measly little clerical job, and devoted my full time to my Radio business.

Since that time I've gone right on up, always under the watchful guidance of my friends at the National Radio Institute. They would have given me just as much help, too, if I had wanted to follow some other line of Radio besides building my own retail business—such as broadcasting, manufacturing, experimenting, sea operating, or any one of the score of lines they prepare you for. And to think that until that day I sent for their eye-opening book, I'd been wailing "I never had a chance!"

NOW I'm making real money. I drive a good-looking car of my own. Mary and I don't own the house in full yet, but I've made a substantial down payment, and I'm not straining myself any to meet the installments.

Here's a real tip. You may not be as bad off as I was. But, think it over—are you satisfied? Are you making enough money, at work that you like? Would you sign a contract to stay where you are now for the next ten years, making the same money? If not, you'd better be *doing* something about it instead of drifting.

This new Radio game is a live-wire field of golden rewards. The work, in any of the 20 different lines of Radio, is fascinating, absorbing, well paid. The National Radio Institute—oldest and largest Radio home-study school in the world—will train you inexpensively in your own home to know Radio from A to Z and to increase your earnings in the Radio field.

Take another tip—No matter what your plans are, no matter how much or how little you know about Radio—clip the coupon below and look their free book over. It is filled with interesting facts, figures, and photos, and the information it will give you is worth a few minutes of anybody's time. You will place yourself under no obligation—the book is free, and is gladly sent to anyone who wants to know about Radio. Just address J. E. Smith, President National Radio Institute, Dept. PC-5, Washington, D. C.

J. E. SMITH, President,
National Radio Institute,
Dept. PC-5, Washington, D. C.

Dear Mr. Smith:

Please send me your 64-page free book, printed in two colors, giving all information about the opportunities in Radio and how I can learn quickly and easily at home to take advantage of them. I understand this request places me under no obligation, and that no salesmen will call on me.

Wins World's Championship & Cup

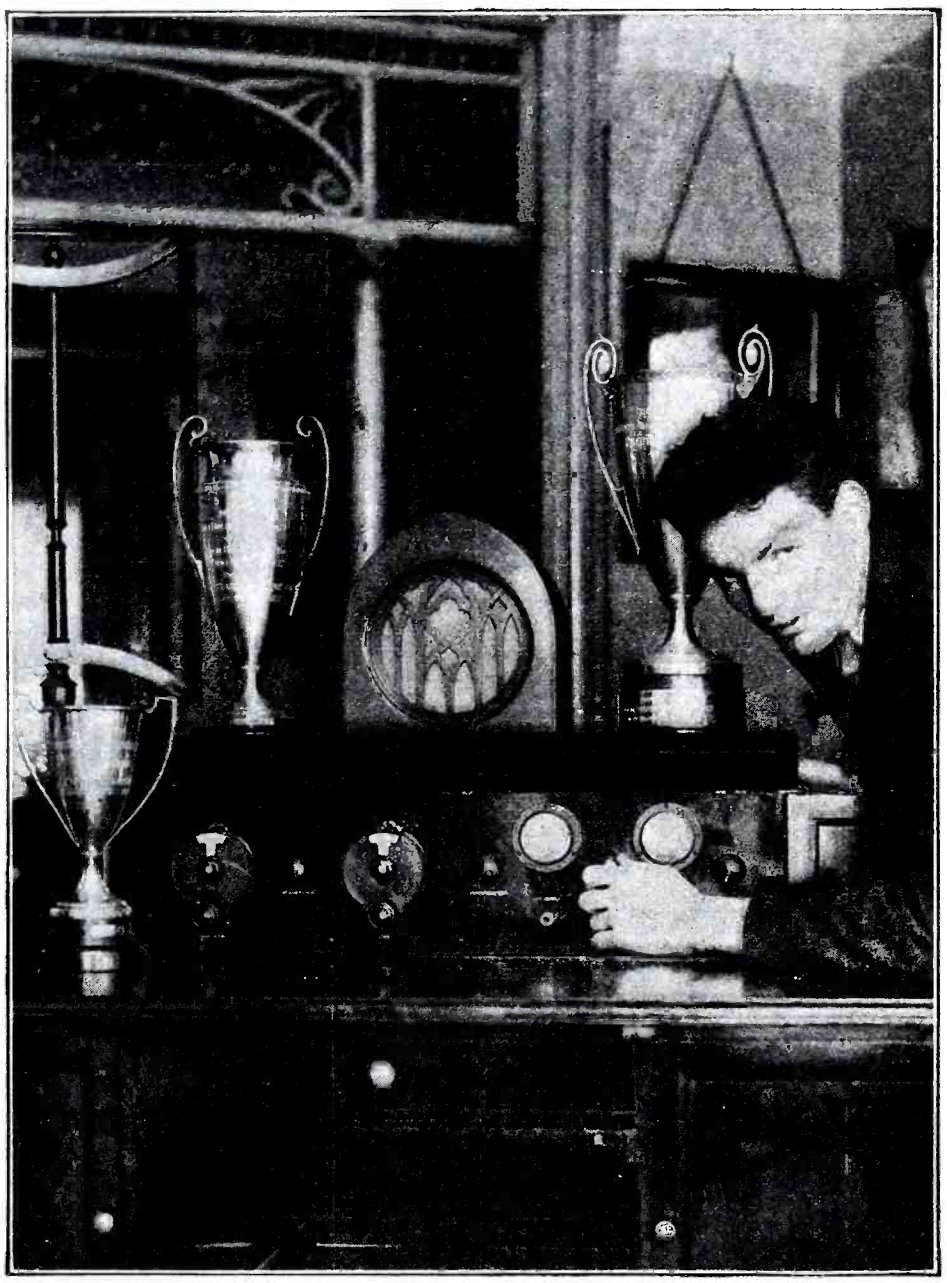
with the famous Robertson-Davis

HOT SPOT Fourteen Receiver

John H. Hartley, of Brooklyn, N. Y., retains World's International Championship for Set Building at the Radio World's Fair in New York, using the famous

Roberston-Davis HOT SPOT 14 Receiver

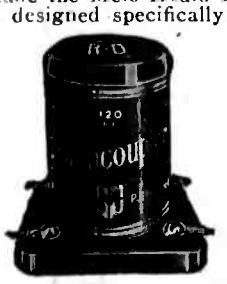
to defend his 1926 Championship Cup



NO RECEIVER HARMONICS

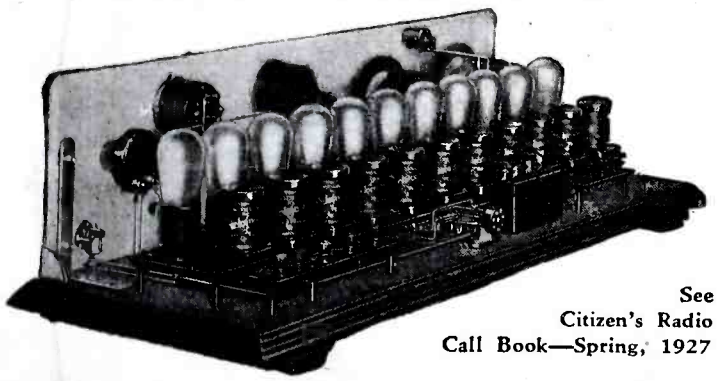
ACTUAL SINGLE POINT RECEPTION—NO REPEATS

The same mixing system is used in the HOT SPOT Fourteen that made the Melo-Heald Eleven famous. Each intermediate transformer is designed specifically for its position. Only one oscillator setting is necessary for each station — real single point reception. 14 Tubes—No Oscillator Repeats. 8 Stages of Intermediates — 3 Stages of Audio. 2 Tuning Controls — Easily Tuned as Single Stage. Quick and Simple to Build — Beautiful Panel and Chassis. "A" BAT., 2 Amps.—"B" BAT., 35 Milliamperes. Loop Regeneration—Potentiometer—Volume Control. These are the features that enabled John H. Hartley to win the cup and Radio's Highest Honors.



The famous Robertson-Davis

Melo-Heald Eleven Receiver



See Citizen's Radio Call Book—Spring, 1927

PHOTO FROM: WIDE WORLD PHOTOS.

NEW YORK WIRE: September 24, 1927.

By Telegraphic Dispatch from N. Y. comes news of the HOT SPOT'S wonderful efficiency by enabling John H. Hartley to retain Title and Cup for another year.

The illustration above shows Hartley with his Championship HOT SPOT Fourteen Receiver that enabled him to out-class all contenders in the keen competition for the Set Building honors at the Radio World's Fair in New York City.

Further details of the HOT SPOT Fourteen are printed in the editorials of Radio Listeners' Guide and Call Book. The famous Melo-Heald Eleven is explained in the Spring, 1927, issue of Citizen's Radio Call Book and other leading publications.

RADIO'S TWO PHENOMENAL RECEIVERS—The famous Robertson-Davis HOT SPOT Fourteen and Melo-Heald Eleven are illustrated above with the Meloformer (Audio Frequency) and the Melocoupler (Radio Frequency), the Certified transformers that are the secret of such great success in radio reception. Details of these exceptional receivers and transformers sent FREE on request.

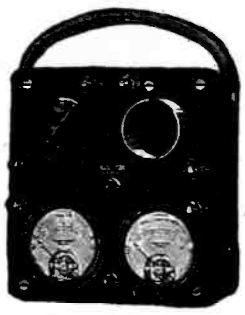
When Radio Instruments are Mentioned You Think of "JEWELL" —BECAUSE—

No. 135—The choice of the set builder. It is specified in most popular radio circuits. It has a D'Arsonval moving coil type movement and is a high quality instrument. 0-8 volt scale.



No. 115—A small compact tube checker with provision for testing power tubes. Genuine bakelite case with carrying handle. Tubes can be rapidly tested with this instrument.

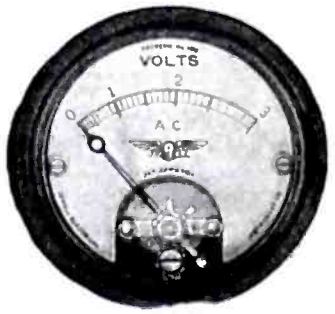
No. 139—A small high resistance voltmeter of the D'Arsonval type suitable for use by the individual in checking and adjusting B-eliminator voltages. 0-300 volt scale.

—every place you go you see Jewell instruments in use. Your friend has Jewell instruments mounted on the panel of his set for regulating the A and B battery voltage or else has Jewell portable instruments for checking the A and B batteries or for testing his set. Your local battery man has Jewell instruments on his charging panel. Your amateur acquaintance governs his transmitting power with the famous Jewell trio of transmitting instruments. The radio service man who services your set carries a Jewell radio service set or a Jewell radio set analyzer on all his service calls. Your radio dealer uses Jewell tube testers and testing equipment for checking his product before you take it home. Your radio set was tested with Jewell instruments at the factory by the manufacturer before its release for sale.

And so it is—everywhere—everyone using Jewell instruments. There is a reason. All of these people use Jewell equipment because there is a special Jewell instrument for every radio use and they have found them to be sturdy and reliable.

You—too, will want Jewell instruments so write for your copy of our 15-C radio instrument catalog.

No. 64—Radio frequency ammeter. One of the famous Jewell Transmitting Trio. Thermo couple type in 3-inch case. Instrument loss is less than ½ of the minimum required by the Navy.



No. 190—A.C. Filament Control voltmeter. Case is 2 inches in diameter and matches No. 135. It is accurate and neat in appearance and is designed for continuous service with small energy consumption.

No. 133—Radio Set Analyzer. Enables a service man to quickly locate the source of trouble in a radio set. The case is of genuine black Morocco leather 4½ x 6⅛ x 8⅜ inches.

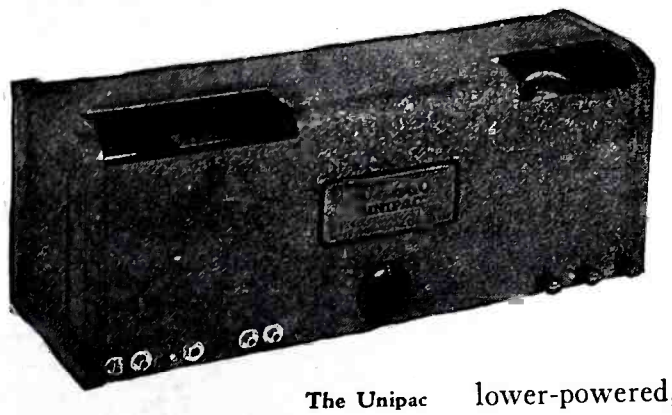
Power Amplification with Tone

DO you know that no matter what kind of a set you have, by adding an S-M Unipac you can eliminate all B batteries and add power amplification that will give you tone quality obtainable by no other method—not even with the most expensive of the new sets?

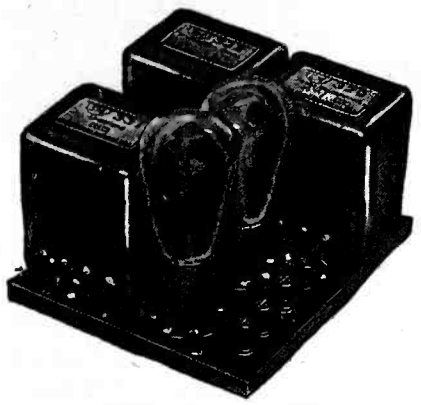
The 660-210 push-pull Unipac is a light socket push-pull 210 power amplifier stage (and receiver B supply) far superior to any other power pack you can buy. It will give from five to fifteen or more times the power you can get from any other 210 power pack—in fact, it is the finest amplifier ever offered. It is priced at $83.25 for the kit.



The Unipac

Then there's the new 660-171A Unipac, a similar model for 112 or 171 tubes that will far out-perform ordinary 210 packs, and it also supplies ABC power for any receiver at all using A.C. tubes. It is priced at $66.00, or for the same kit, slightly lower-powered, with receiver B supply as well, $64.00.

The 660-240 Unipac, a two stage amplifier and B supply for any set at all is the choice of L. M. Cockaday for his LC-28 set, and of Glen Browning for the new two tube Browning Drake. It is priced at $81.25 for the kit, and uses one 210 amplifier, one 226 A.C. amplifier, two 216B or 281 rectifiers and one 874 ballast tube.



652A "Reservoir B"

LIGHT SOCKET ABC POWER

S-M power supplies are available in two types, 652A is an ABC power plant delivering up to 180 volts B, 40 volts for C, for any receiver, and 1.5, 2.5 and 5 volts for A power for A.C. tube sets. It is $36.50, ready to assemble. Type 652 unit, a B supply only of 180 volts output is $34.50. Both use the ballast or glow tube voltage regulator tube insuring no "motor-boating," "putting" or "humming."

S-M PLUG-IN COILS

No matter what circuit you build, there's a standard S-M plug-in coil for your needs. S-M coils are low loss, accurate to ¼ or one percent, and rugged and efficient. Different sizes tune from 30 to 3000 meters; for short wave tuners, one tube sets, tuned R.F. circuits, supers, or what have you? Broadcast and short wave coils are $2.50 each, and the interchangeable plug-in socket, type 515, $1.00.

Plug-In Inductances

THE NEW TRANSFORMERS

Three new S-M transformers are ready. One is the new super-power 328 unit, with two 550 volt secondaries, two 7.5 volt secondaries and one 1.5 volt winding, in addition to a 105-120 volt, 60 cycle primary. For single or full-wave power supplies, it costs but $18.00 (331 Unichoke at $8.00 is a single unit selective brute-force filter choke for all powers up to 125 M.A. and for use with 328 transformer). The new small type audios (selected by Hugo Gernsback for the Peridyne, by L. M. Cockaday for the LC-28 amplifier and approved by Glen Browning for the two tube Browning Drake amplifier) contain more steel and copper than any other transformers you can buy except S-M 220, and performs on a par with the 220 from 100 to 5000 cycles. The new compact 240 audio is but $6.00—241 output $5.00—the best values ever offered by any manufacturer.

440 JEWELERS' TIME AMPLIFIER

The 440 Time Signal Amplifier is tremendously popular already. The Waltham Watch Company uses one for controlling their master clock, as do many jewelers and observers. Thousands have been sold, for its the best long wave amplifier ever develoned. Three stages and a detector, shielded and tuned exactly to 112 K.C., provide tremendous sensitivity and selectivity. Price, laboratory calibrated, sealed in a copper and brass catacomb, $35.00.

We can't tell you here about all the new S-M developments, but if you'll send us 10c postage we'll send you more information on complete light socket operation, super audio amplification and other pertinent subjects than you can read in a week.

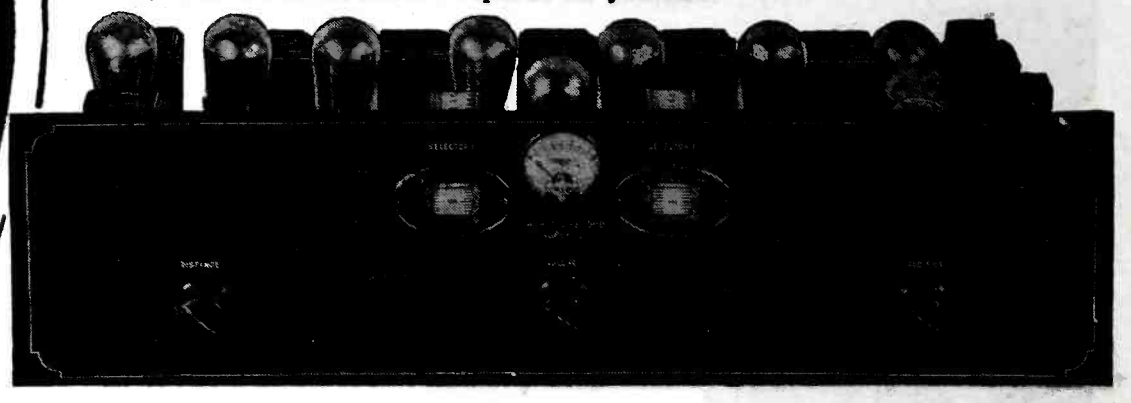
Build Radio's New

Mr. E. H. Scott, himself, will tell you how he designed the original DX receiver, with which he made the four World's Records described on the opposite page—how that set has been duplicated hundreds of times, each one performing as well as the original—how later developments and refinements have enabled him to improve on the original in the New World's Record Super 10—and how you can, even without any previous experience, build a World's Record Super 10 for yourself.



DISTANCE—Here is the receiver for the man who wants the most powerful and sensitive set it is possible to build. Many claim to have received far distant stations once or twice, but Mr. Scott with his World's Record Super proved his claims to record honors by bringing in consistently, night after night, stations distant six thousand miles or more. The new World's Record Super 10, in actual comparative tests with the original receiver on which the records were made, has proved that it is even more powerful and brings in the far distant stations with almost unbelievable volume.

No other receiver has approached the marvelous DX records that the World's Record Super has established, and it is safe to say none will for years to come.

REMARKABLE SELECTIVITY—Here is a receiver for today's conditions. In Chicago, where there are about forty broadcasting stations, the New World's Record Super 10 cuts through with the greatest of ease. It brings in distant stations only a few meters apart with such volume that you think you have a local station until you hear the call letters and find you are listening to a station hundreds of miles away.

NATURAL TONE QUALITY—A receiver may have great DX ability and wonderful selectivity, but what good is it if the tone is raspy or distorted? When you hear the New World's Record Super 10, you will realize that here at last is a receiver that it is a pleasure to listen to.

EASY TO BUILD—With the parts here listed, any one can build an exact duplicate of the New World's Record Super 10. The only tools required are a screw driver, pliers, and soldering iron. The building instructions and full size blue prints show exactly where to place each part and how to run every connection, and are so simple and easy to follow that any one, even without previous experience in building a radio receiver, can duplicate this marvelous receiver and own the finest radio set available today.

— LIST OF PARTS —

1	Formica panel drilled and engraved 26x7x3/16	$ 6.70	
1	Formica sub panel drilled 25x10x3/16	7.00

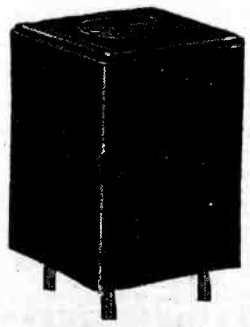
1	S. M. balancing condenser No. 340	1.50	
1	Carter power rheostat MW-1 ohm	.75	
1	Carter Imp. pot. 1R-400 ohms	1.25	
1	Carter fixed condenser 00025 with grid clips	.50	
1	Carter fixed condenser 002	.50	
1	pr. No. 10 Carter pin jacks	.20	
1	Jewel Voltmeter 0.8v Pat. 135	7.00	
4	Tobe Bypass condensers 1 Mfd	3.60	
1	Tobe grid leak	.50	
1	Jones 10 contact multi-plug and 4 ft. cable type BM	3.50	
40	Kellog soldering lugs	.25	
30	ft. rubber covered hook-up wire	.50	

Here's your chance to build a radio set that will give you all that radio has to give—distance, selectivity, clear and natural tone. Experience is not required, for full instructions will be sent you by Mr. Scott himself. Don't hesitate—don't delay. Send *now* for full details. Then you can't forget it, and you'll never regret it.

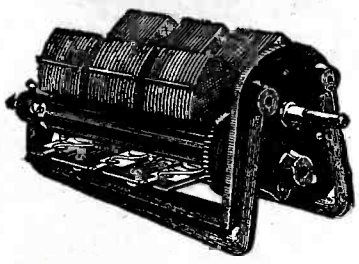
Greatest "DX" Receiver

World's Record Super 10

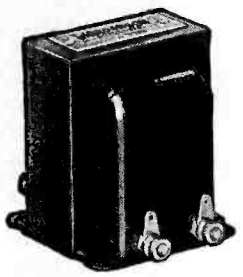


Selectone Transformers cut through the local stations with ease, and their tremendous amplification brings in the distant stations with great volume.

They are supplied in perfectly matched sets, insuring maximum amplification and the finest tone quality.

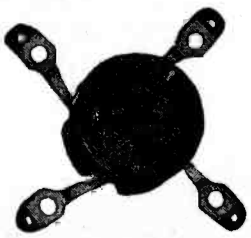


The new Remler Three-in-Line Condenser with the Remler Drum Dial represents the last word in gang condenser construction. Balancing condensers are integral with the main unit, and are easily and quickly adjusted. A special staggered connection of plates makes it self-shielding, preventing interstage coupling. All insulation is of genuine Bakelite.



Thordarson Amplifying Transformers were used in the original World's Record Super, designed by Mr. Scott. Because of the unusual tone quality obtained Thordarson apparatus is again selected. Two Thordarson R-200 Amplifying Transformers and one R-76 Output Transformer are used in this receiver.

If you enjoy good music, insist on Thordarson amplification.



The famous Benjamin Spring Cushioned Shock Absorbing Socket was the choice of Mr. E. H. Scott in his original World's Record Super.

Mr. Scott has paid the very highest tribute to the efficiency of Benjamin Shock Absorbing Sockets by again selecting them for this newest and greatest of radio receivers.

Tobe Condensers. Only the highest grade parts were selected by Mr. Scott for the World's Record Super 10, and the fact that Tobe parts are specified is one more proof of their claim for leadership in the condenser field.

Here Are the Verified Records

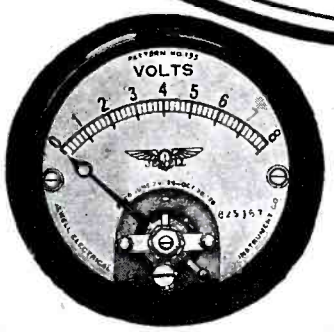
The authenticity of the startling achievements of the World's Record Super (as listed below) is based upon hundreds of verifications by leading Broadcasting Stations and Publications from Coast to Coast.

1 On March 17th established new World's Record for *loop aerial reception*—8,375 miles with Loud Speaker Volume.

2 On the night of March 29th established new World's Record with the reception of *six foreign stations* distant 6,000 miles or more.

3 Established new World's Record for *greatest number of broadcasting stations* heard that are located 6,000 or more miles away.

4 Established new World's Record for *most consistent reception*, night after night, of Stations 6,000 miles or more distant—117 programmes from 19 different Foreign Stations, heard between December 27th and April 10th.



In the careful selection of parts and accessories for the New World's Record Super 10, it is quite natural that a Jewell Pattern No. 135 Radio Voltmeter should be chosen. The black enameled case encloses a fine, D'Arsonval, moving coil type movement having silvered parts and equipped with a zero adjuster. The scale is silver etched with black characters. A special mounting arrangement makes it easy to mount in a radio panel. It is the ideal instrument for filament control.

Jones Ten Contact Multiplug and 4 ft. Cable enable all batteries to be placed out of sight and simplify wiring. Now used on over one million receivers; endorsed by leading radio engineers.

Half Size

Carter Rheostats are so designed that they are self-cooling and contact arm shaped so that it provides smooth contact with constant pressure at all times, making control of filaments noiseless.

EXCELLO RADIO CONSOLES

In Many Models To Suit Every Taste

Style R-31

In the Excello Line you will find every modern type of Radio Console all incorporating latest features of convenience and utility.

The creation of these smart designs so closely in keeping with the present trend is an achievement to delight all radio fans and to add a beautiful piece of furniture to the home.

The cabinet work is of true Excello quality. Doors of 5-ply butt walnut in rich piano finish.

The sound chambers are above or below the set compartment. In the latter type all confusing vibrations arising when a cone is enclosed are entirely eliminated. Consoles of this type come with or without horn speaker of long air travel type and will accommodate a 22-inch cone type speaker as well as batteries, charger or eliminator.

Excello Cabinets with sound chamber above as in Styles R-23 or R-32 are so designed that they develop the full tonal range from lowest bass to highest treble.

Special filler panels are furnished without extra charge so that any Excello Console will accommodate Atwater-Kent, Fada, Freed-Eisemann, Kellogg, Stromberg-Carlson and all other standard receivers.

Style R-32

Style R-23

Style R-29

Style R-28

Balkite has pioneered—
but not at public expense

Licensed under Andrews-Hammond patent

Balkite "A" *Contains no battery.* The same as Balkite "AB" but for the "A" circuit only. Not a battery and charger but a perfected light socket "A" power supply. One of the most remarkable developments in the entire radio field. Price $35.00.

Balkite "B" *One of the longest lived devices in radio.* The accepted tried and proved light socket "B" power supply. The first Balkite "B," after 5 years, is still rendering satisfactory service. Over 300,000 in use. Three models: "B"-W, 67-90 volts, $22.50; "B"-135*, 135 volts, $35.00; "B"-180, 180 volts, $42.50. Balkite now costs no more than the ordinary "B" eliminator.

Balkite Chargers

Standard for "A" batteries. Noiseless. Can be used during reception. Prices drastically reduced. Model "J,"* rates 2.5 and .5 amperes, for both rapid and trickle charging, $17.50. Model "N"* Trickle Charger, rate .5 and .8 amperes, $9.50. Model "K" Trickle Charger, $7.50.

**Special models for 25-40 cycles at slightly higher prices*

Prices are higher West of the Rockies and in Canada

The great improvements in radio power have been made by Balkite First noiseless battery charging. Then successful light socket "B" power. Then trickle charging. And today, most important of all, Balkite "AB," a complete unit containing no battery in any form, supplying both "A" and "B" power directly from the light socket, operating only while the set is in use.

This pioneering has been important. Yet alone it would never have made Balkite one of the best known names in radio. Balkite is today the established leader because of Balkite performance at the hands of its owners.

Because with 2,000,000 units in the field Balkite has a record of long life and freedom from trouble seldom equalled in any industry.

Because of the first 16 light socket "B" power supplies put on the market, Balkite "B" alone remains in its original form; all others have either been radically revised in principle or completely withdrawn.

Because the first Balkite "B," purchased 5 years ago, is still in use and will be for years to come.

Because to your radio dealer Balkite is a synonym for quality.

Because the electrolytic rectification developed and used by Balkite is so reliable that today it is standard on the signal systems of most American as well as European and Oriental railroads.

Because Balkite is permanent equipment. Balkite has pioneered—but not at the expense of the public.

Today, whatever type of set you own, whatever type of power equipment you want (with batteries or without), whatever you want to pay for it, Balkite has it. And production is so enormous that prices are astonishingly low.

Your dealer will recommend the Balkite equipment you need for your set.

Balkite "AB" *Contains no battery.* A complete unit, replacing both "A" and "B" batteries and supplying radio current directly from the light socket. Contains no battery in any form. Operates only while the set is in use. Two models: "AB" 6-135,* 135 volts "B" current, $64.50; "AB" 6-180, 180 volts, $74.50.

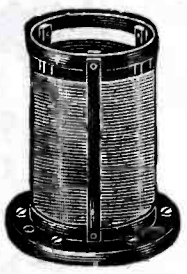
You Need These New and Improved

AERO COIL

SUPER-SENSITIVE
INDUCTANCE UNITS



The Improved AERO Universal Coil

At last—a true universal coil. This improved coil is suitable for any straight tuned radio frequency circuit, both bridge and loss balance. It is easily and ideally adaptable to 3, 4, 5, 6 or 7 tube sets and can be used with all types of tubes—201-A, 199, 112, and the new 240 tubes and A.C. tubes.

Sharp selectivity, true tone quality, distance and volume, to a heretofore unknown degree, are assured where these coils are used. For that reason the improved Aero 6, Aero 7, Aero 4, and other circuits built around these coils will be more popular than ever during the coming season.

New AERO Kits Employing the Improved AERO Universal Coil

The AERO Universal Tuned Radio Frequency Kit

Kit of 4 Coils (For Improved Aero-Dyne 6)

Code No. U-16

Kit consists of 4 twice matched units—adaptable to all standard tubes. Tuning range below 200 to above 550 meters. This kit will make any set better in selectivity, tone and range. Will eliminate losses and give the greatest receiving efficiency. Each kit is carefully matched at both ends of the broadcast range.

For .0005 Condenser, Code No. U-16.....Price $15.00
For .00035 Condenser, Code No. U-163.....Price $15.00

The AERO Universal Tuned Radio Frequency Kit

Kit of 3 Coils (For Aero-Seven)

Code No. U-12

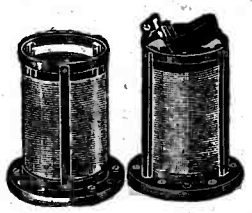
Consists of 3 twice matched units. Coils are wound on Bakelite skeleton forms, assuring a 95% air di-electric. Range from below 200 to above 550 meters. Each kit carefully matched at both ends of the broadcast range.

For .0005 Condenser, Code No. U-12.....Price $12.00
For .00035 Condenser, Code No. U-123.....Price $12.00

AERO Universal 3-Circuit Tuner

In the form of a 3 circuit tuner with a fixed tickler, this Aero Coil will improve any circuit. Adaptable only to 201-A, 199, 112, or the new A.C. Tubes. Has variable primary for governing selectivity.
Code U-55 (For .0005 Condenser) or Code U-553 (for .00035 Condenser)..Price $4.00

AERO Radio Frequency Regenerative Kit



The supersensitive kit, used in the new Aero 4 and The Chicago Daily News Receiver, will improve the efficiency of any circuit. For use with 201-A, 112, 199, and the new A.C. Tubes. Use as .0005 variable condenser to tune fixed tickler.
Code U-95 (for .0005 Condenser) or Code U-953 (for .00035 Condenser)..Price $8.00

AERO Universal Antenna Coupler

A highly efficient low-loss and antenna coupler with variable primary, adaptable to 201-A, 199, 112, 240 and the new A.C. Tubes.

Code No. U-96 (for .0005 Condenser) or Code No. U-963 (for .00035 Condenser). Price $4.00

AERO Universal Wave Trap Unit

Makes an excellent wave trap due to low distributive capacity and low high frequency resistance. Helps greatly in eliminating interference. Can also be used to improve efficiency of Crystal Sets.
Code No. U-4 (for .0005 Condensers) or Code No. U-43 (for .00035 Condenser).....Price $4.00

AERO Choke 60

Has uniform choking action over a wide range of wave lengths. Eliminates customary "holes" in the tuning range—so common with ordinary chokes. You will find the Aero Choke 60 perfect in every respect.

Price each.....$1.50

AERO Short Wave Kit

The most efficient and satisfactory short wave kit ever offered. Completely interchangeable, and covers U. S. Bands range 15 to 130 meters.
Kit consists of 3 coils and base mountings.
Code No. L.W.T. 125.....Price $12.50

AERO Transmitter Kits

An interchangeable Transmitter Kit at last. Kit 2040-K has range of 16.5 to 52 meters. Kit 4080-K has range of 36 to 90 meters. Kit includes two mounting bases and two choke coils that are interchangeable.
Price (each kit).....$12.00

AERO Choke 248

Designed for use with Aero Transmitter Kits and other circuits. Prevents a high impedance over usual amateur wave lengths.

Price each.....$1.50

IMPORTANT NOTICE

We furnish foundation units, drilled and engraved by Westinghouse Micarta for the Aero Short Wave, Aero 6, Aero 7, Aero 4, Aero Transmitter, and The Chicago Daily News 4 tube circuits. This is a special service for the home set builder. Full working blue prints with each unit. Dealers may secure samples of blue prints to show their trade for 25c each.

Any of these Aero Kits, Coils and Chokes should be available at your dealer's. If he cannot supply you, order direct from the factory. Be sure to specify code or key numbers when ordering.

8 tube ~ one dial MIRACO

TRADE MARK REGISTERED

MAGNIFICENT TONE~SUPER SELECTIVE~POWERFUL DISTANCE GETTER

All Electric or Battery Set!

America's big, old, reliable Radio Corporation* (8th successful year) **guarantees** in its big, powerful, latest 6, 7 and 8 tube Miraco sets "the finest, most enjoyable performance obtainable in **high grade** radios." Unless 30 days' use in your home fully satisfies you a Miraco is unbeatable at any price for beautiful, clear cathedral tone, razor-edge selectivity, powerful distance reception, easy operation, etc.—**don't buy it! Your verdict final.** Save or make lots of money on sets and equipment—write for testimony of nearby users and **Amazing Special Factory Offer.**

Miraco's work equally fine on "AC" electric house current or with batteries. Take your choice. Many thousands of Miraco users—who bought after thorough comparisons—enjoy programs Coast to Coast, Canada to Mexico, loud and clear—with the magnificent cathedral tone quality of costliest sets. Don't confuse Miraco's with cheap, "squawky" radios. Miraco's have finest parts, latest approved shielding, metal chassis, etc.—as used in many $200 sets.

Deal Direct with Big Factory

Your Miraco reaches you completely assembled, rigidly tested, fully guaranteed. Easy to connect and operate. **30 days' trial free.** 3 year guarantee if you buy. You take no risk, you insure satisfaction, you enjoy **rock-bottom money-saving prices** by dealing direct with one of radio's oldest, most successful builders of fine sets. 8th successful year in the radio manufacturing business.

MIRACO Users Say:

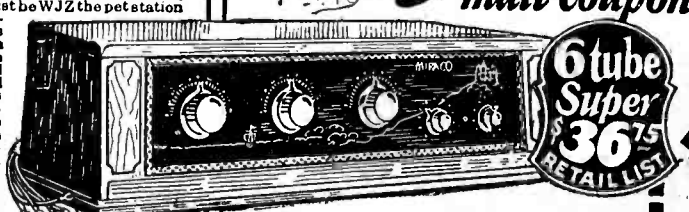
Reports from users everywhere leave little for us to add. These are only a few of the many in our files and which we receive daily. Send coupon for plenty of additional proof and testimony of nearby users.

CLEARER THAN A $450.00 SET
Before I bought your set I tried out and heard quite a number of different makes sets and I believe I can truthfully say that I never yet have heard a set with such wonderful tone and clearness as the Miraco. I never thought that a set could be as clear and reproduce tones and voices as the Miraco. Saturday I listened to a $450.00 set and it can't even come near your set for clearness and volume. I have logged some very distant stations on the Unitune and although people won't hardly believe me, the first week I had KFI Los Angeles on two nights in succession on a 30-ft. temporary inside aerial.—FRANK A. OLDENBURG, Milwaukee, Wis.

SHARPLY SEPARATES STATIONS
The Unitune brings in stations very clearly and with a selectivity that is amazing when you take in consideration the mass of stations on the air at the same time. I have heard three and four stations that were on almost same wavelengths at the same time and was able to tune out one after the other without the least interference.—W. L. BROBACK, San Francisco, Calif.

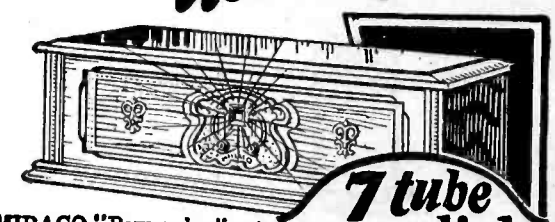
EXPERIENCED FAN PRAISES SET
Miraco is the most wonderful radio I have ever seen. I have had experience with many popular makes of radios, also have built a number of them myself but in tone quality it is far superior to all. For sensitiveness I can say it is more like a superhetrodyne.—R. D. WHITE, Proctor, W. Va.

HAS POWER TO SPARE
"Well Pleased" with Miraco would be putting it mildly. Haven't heard anything to equal it regardless of price. With temporary aerial tuned in WEAF then WIOD Florida felt sure this must be WJZ the pet station of this locality. Stations all coming in clear with wonderful tone and tremendous volume. Seldom have more than half of volume turned on. A local agent insisted he could prove his set superior but to his surprise and astonishment my family and neighbors and the agent himself admitted his $165 set had to step out of the way for Miraco—H. W. HOEPFL, Perkiomensville, Pa.



Another Big Bargain! Famous powerful big Miraco Super 6, 1928 model—ultra selective! Thousands find it outperforms sets of much higher price. **30 Days' Trial Free. Fully Guaranteed.**

Big Discounts to User-Agents



MIRACO "Powerplus" sets—both in 8 and 7 tube models—have magnificently beautiful, clear cathedral tone quality. Turn one dial for stations everywhere. Ultra-selective. Miraco multi-stage distance amplification gives "power-plus" on far-off stations. Latest all-metal shielded chassis. Illuminated dial. Fully guaranteed. *Try one free for 30 days!* Choice of beautiful cabinets.

Licenses Required for Both Transmitters and Receivers in Canada

All radio stations, whether used for transmitting or receiving purposes are required to be licensed in Canada. The penalty on summary conviction for operating an unlicensed radio station is a fine not exceeding $50.00, and on conviction or indictment a fine not exceeding $500.00, with imprisonment for a term not exceeding 12 months. in addition to forfeiture of all unlicensed apparatus. The different classes of stations for which licenses are issued and their license fees vary from $1.00 for a private receiving set to $50.00 for a public commercial station.

The issue of licenses for transmitting stations is limited to British subjects or to companies incorporated under the laws of the Dominion of Canada or its provinces. Licenses for private receiving sets are issued to any person irrespective of nationality. Licenses for receiving sets are obtained from the Postmaster of the larger towns and cities in the Dominion, radio dealers, Royal Canadian Mounted Police, Department of Radio Inspectors, Departmental Agencies or from the Department of Marine and Fisheries. Licenses for all other classes of stations are obtained from the Department of Marine and Fisheries at Ottawa.

The Knickerbocker Four

by Joseph Calcaterra

IN these days one would almost believe that no receiver can be any good at all unless it makes use of at least a half dozen tubes, and preferably a dozen. A great majority of the receivers featured in the construction sections of the radio publications call for the use of eight or nine tubes. It will therefore come as a relief to many fans to get the "low-down" on a first class receiver that makes use of only four tubes.

The Knickerbocker Four receiver is such a receiver. It does not resort to reflexing or any other tricks but nevertheless is capable of delivering results equal to those obtained from many of the receivers that use more tubes. This statement is not an unusual one, but its truth in this case is borne out by the working of the receiver and will be self-evident to readers from the theoretical description which is to follow.

Many of us whose experience in radio dates back beyond the present multi-tube era, remember the astonishing results obtainable with the old one or two tube regenerative receivers. The old "single-circuit" receivers, although they left much to be desired, certainly were able to step out and bring in the distant stations.

These old receivers would not be suitable for use today mainly because they were not selective enough to cope with the present day congestion of the air. Then, too, they had the disadvantage of poor parts, unstable values of resistance and capacity, audio transformers with poor amplification curves, etc. If the regenerative principle is incorporated in a receiver which also includes the other developments of the past few years, the results obtained should be well worth while.

This was the idea behind the Knickerbocker Four receiver. The result is a receiver which employs one stage of highly efficient, tuned radio-frequency amplification; a detector which employs automatically regulated regeneration; and two stages of high-grade, transformer coupled audio amplification. The circuit idea in itself is not a new one. In fact such a four tube arrangement is generally recognized as a highly efficient combination and during the past year has been one of the most popular with home radio constructors.

Heretofore there have been two outstanding objections to the employment of a regenerative detector following a stage of tuned, radio-frequency amplification. The first has been that in order to make the R.F. stage stable it has been necessary to cut its efficiency to a point where it did little except serve as a coupling tube to couple the antenna to the detector. It served the purpose in most cases of preventing radiation of the oscillations of the detector but that is about all.

The second objection has been the necessity for an extra control knob to regulate the amount of regeneration. thus making a one tube amplifier a three control job.

In the Knickerbocker Four receiver both of these faults have been eliminated. The outstanding factor in so doing has been the use of the Equamatic type coupling coils, which provide automatic variable coupling for both the R.F. and the detector stages. In the first case the coil unit which couples the antenna circuit to the R.F. tube consists of a secondary and a primary coil, each of which is wound on an individual form and has its individual means for mounting. The secondary coil is mounted on the base-

PARTS REQUIRED

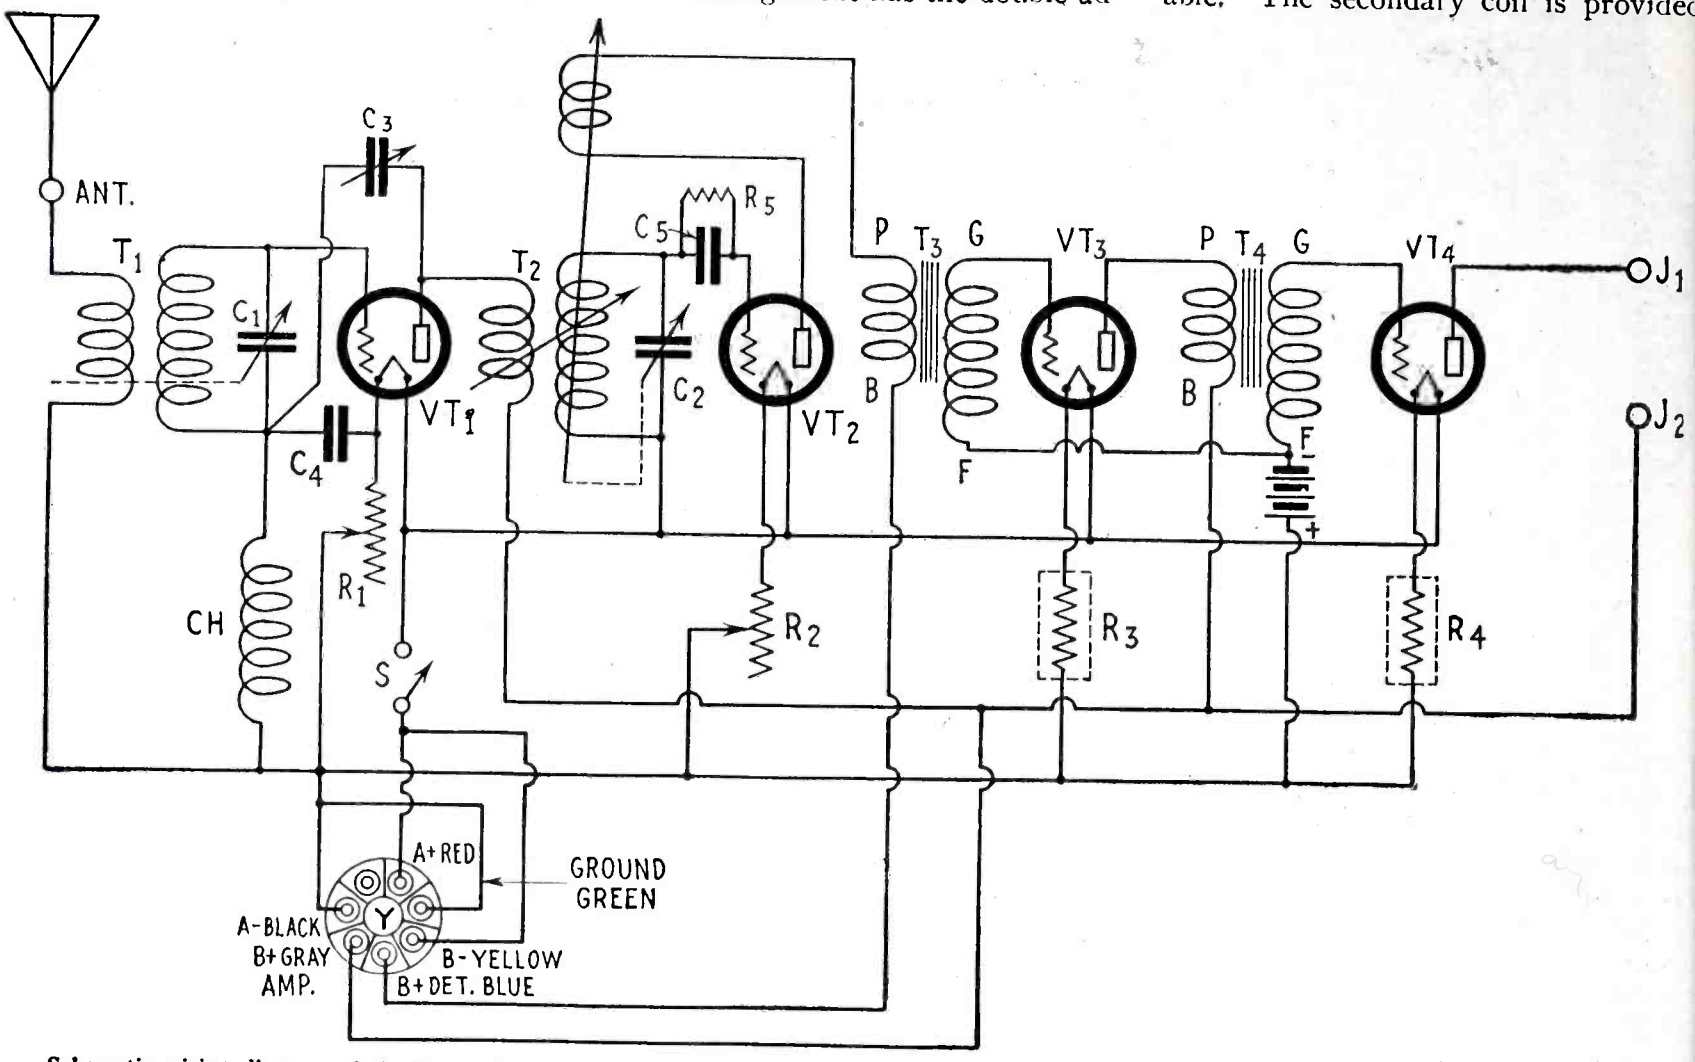
- 1 7" x 18" x 3/16" Formica panel
- 1 8" x 17" x 3/16" Formica sub-panel
- 2 Karas sub-panel mounting brackets
- 2 Karas Orthometric, .00037 mfd. variable condensers (C1, C2)
- 1 Samson Neutralizing condenser (C3)
- 1 Carter .0001 mfd. Molded mica condenser (C4)
- 1 Carter .00025 mfd. Molded mica condenser with clips for grid leak mounting (C5)
- 1 Samson No. 85, R.F. choke coil (CH)
- 2 Carter No. 10 tip jacks (J1, J2)
- 2 Yaxley 20 ohm air cooled rheostats (R1, R2)
- 2 Amperites No. 1A (R3, R4)
- 1 Lynch or Durham 2 megohm Metalized grid leak resistor (R5)
- 1 Karas Equamatic inductance coil (T1)
- 1 Karas 3-Circuit inductance (T2)
- 2 Karas Harmonik audio-frequency transformers (T3, T4)
- 4 Benjamin Type 9040, Cle-Ra-Tone sockets (VT1, VT2, VT3, VT4)
- 2 Karas Micrometric vernier dials
- 1 Yaxley Cable Connector Plug
- 1 Yaxley No. 10, Midget battery switch (S)
- 1 package Cornish Braidite or Flexibus hook-up wire
- 1 X-L binding post (antenna)
- 1 "C" battery and clip (CB)
- 1 package Kester radio solder

board or sub-panel while the primary coil is mounted on the rear end of the shaft of the tuning condenser, by means of an extension mounting arm and collar that is provided with the coil. The secondary coil is mounted directly behind the variable condenser in such a position that the mounted primary coil can turn within the secondary. Then, by placing the secondary coil at the proper angle, the coupling between the coils will vary as the condenser rotor is turned, during the tuning process. Thus, when a high wave station is tuned in, the primary coil will be parallel with the secondary and the coupling will be close. When the condenser knob is turned to tune in low wave stations, the primary coil turns with it and the coupling is loosened accordingly.

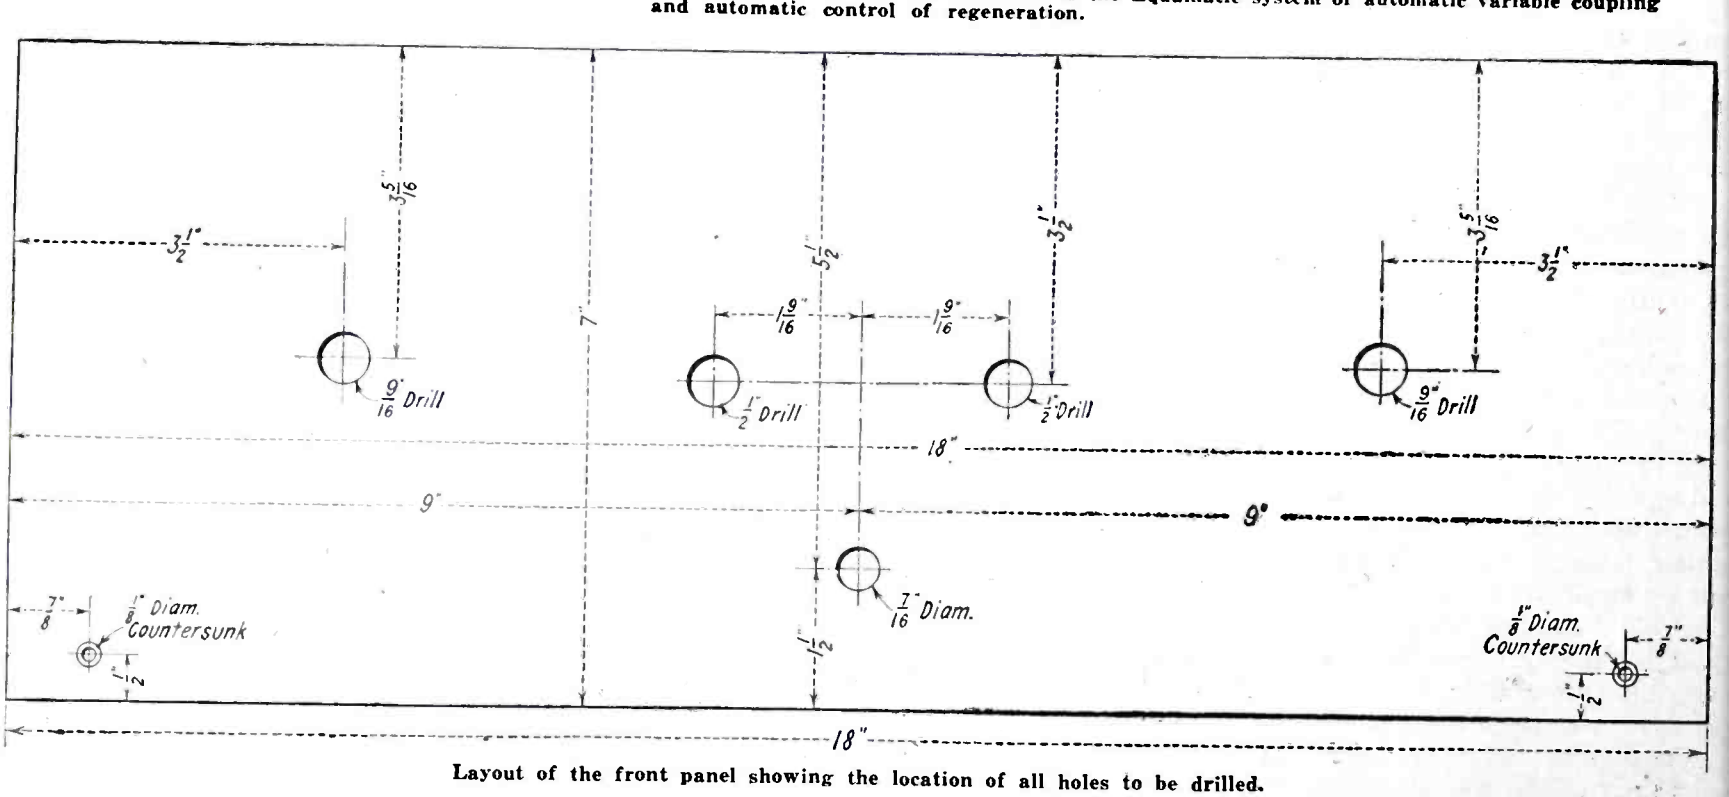
This arrangement has the double advantage that it provides the close coupling required for adequate energy transfer at the high waves, and the comparatively loose coupling needed at the lower waves to avoid excessive tendency toward oscillation. This automatic coupling scheme is adjustable so that it may be made to automatically cover any range or degree of coupling.

In the case of the coil unit which provides the coupling between the R.F. tube and the detector, there are three coils. The primary-secondary coupling is variable, while the secondary-tickler coupling is automatically variable. The secondary coil is provided with a bracket for mounting on the baseboard or sub-panel and the primary coil is hinged directly onto the secondary. The coupling between these two coils is adjusted once and thereafter requires no further attention.

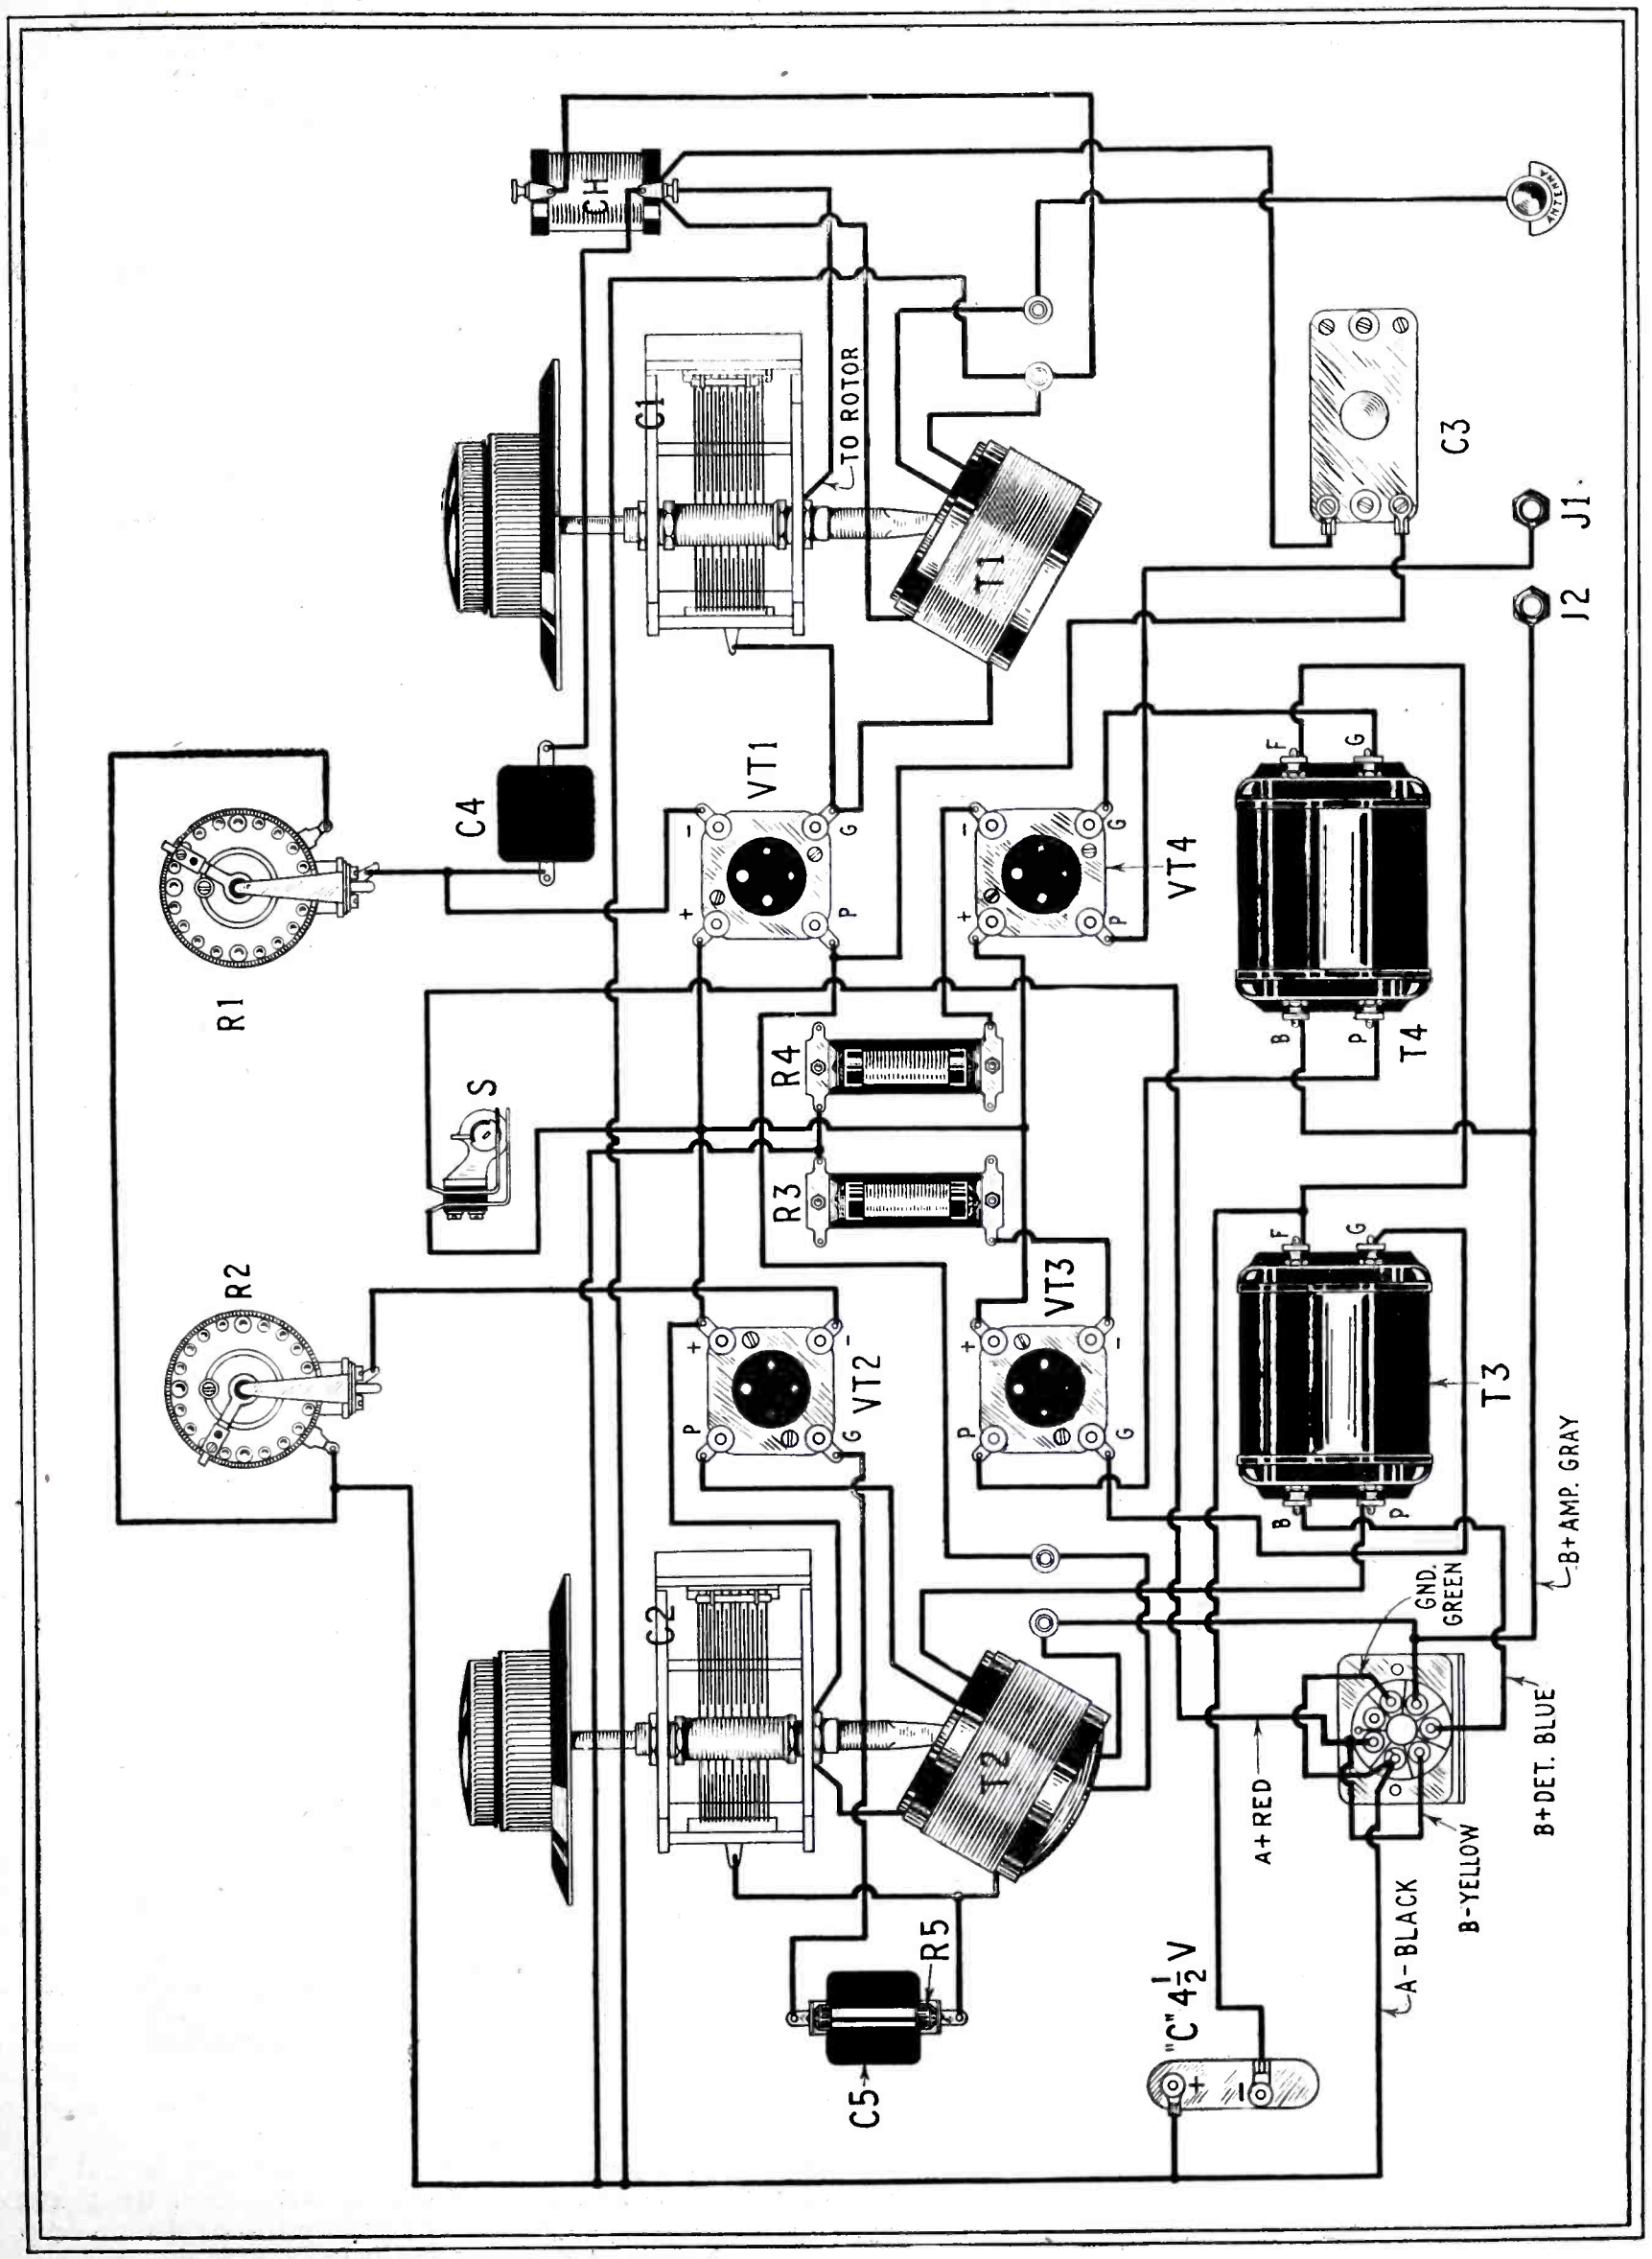
The tickler coil is attached to the rear end of the condenser extension shaft and therefore turns with the ro-



Schematic wiring diagram of the Knickerbocker Four. The special feature of this circuit is the Equamatic system of automatic variable coupling and automatic control of regeneration.

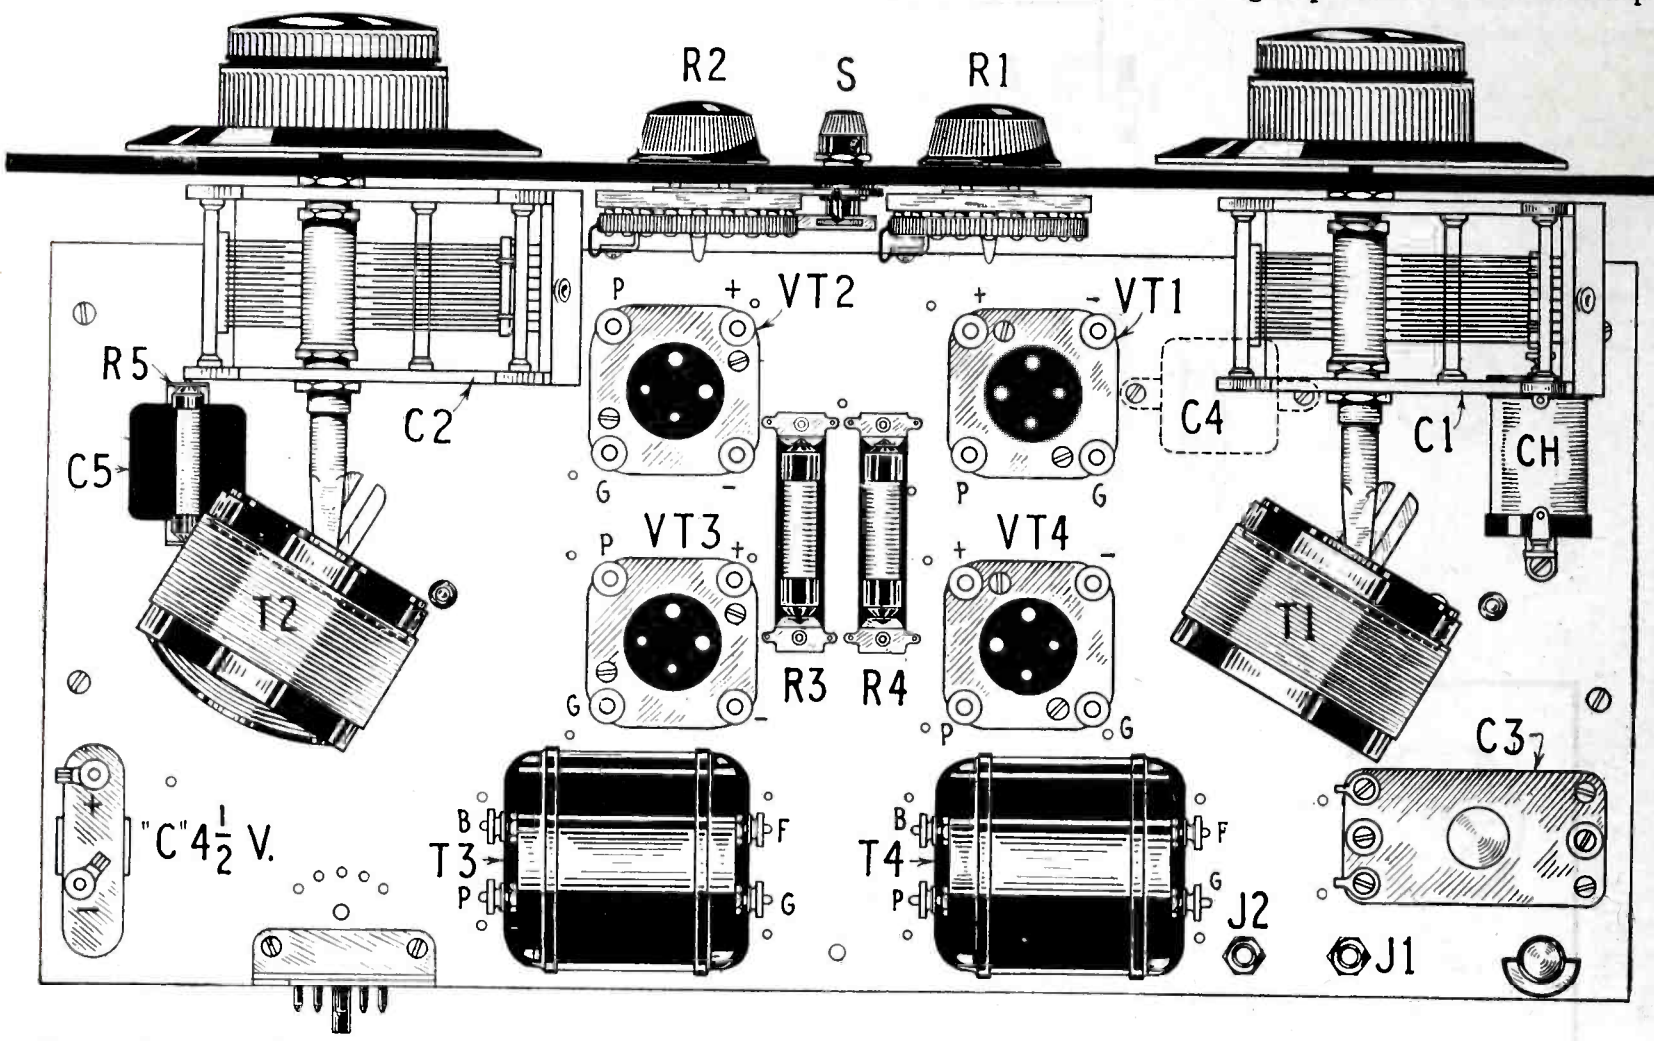


Layout of the front panel showing the location of all holes to be drilled.



tor plates of the condenser, when the receiver is tuned. In so turning, it varies the coupling between the secondary and tickler coils and thereby regulates the amount of energy that is fed back from the plate circuit to the grid. By properly adjusting the angle of the secondary coil the coupling range may be regulated so that throughout the entire broadcast band the detector will be kept just under the point of oscillation, and therefore in its most sensitive condition.

Inasmuch as the tickler adjustment is usually quite critical it seems at first glance to be somewhat surprising that automatic control can be used in its regulation. A little study of the equamatic coil system makes the matter entirely clear, however. With the secondary coil set in a position where its winding is parallel with the front panel, the coupling between it and the tickler will not vary when the tickler coil is rotated by the condenser drive shaft because the tickler will remain at the same angle in its relation to the



Layout of parts on the front and sub-panel. The single binding post shown in the lower right hand corner of the above illustration is the aerial terminal.

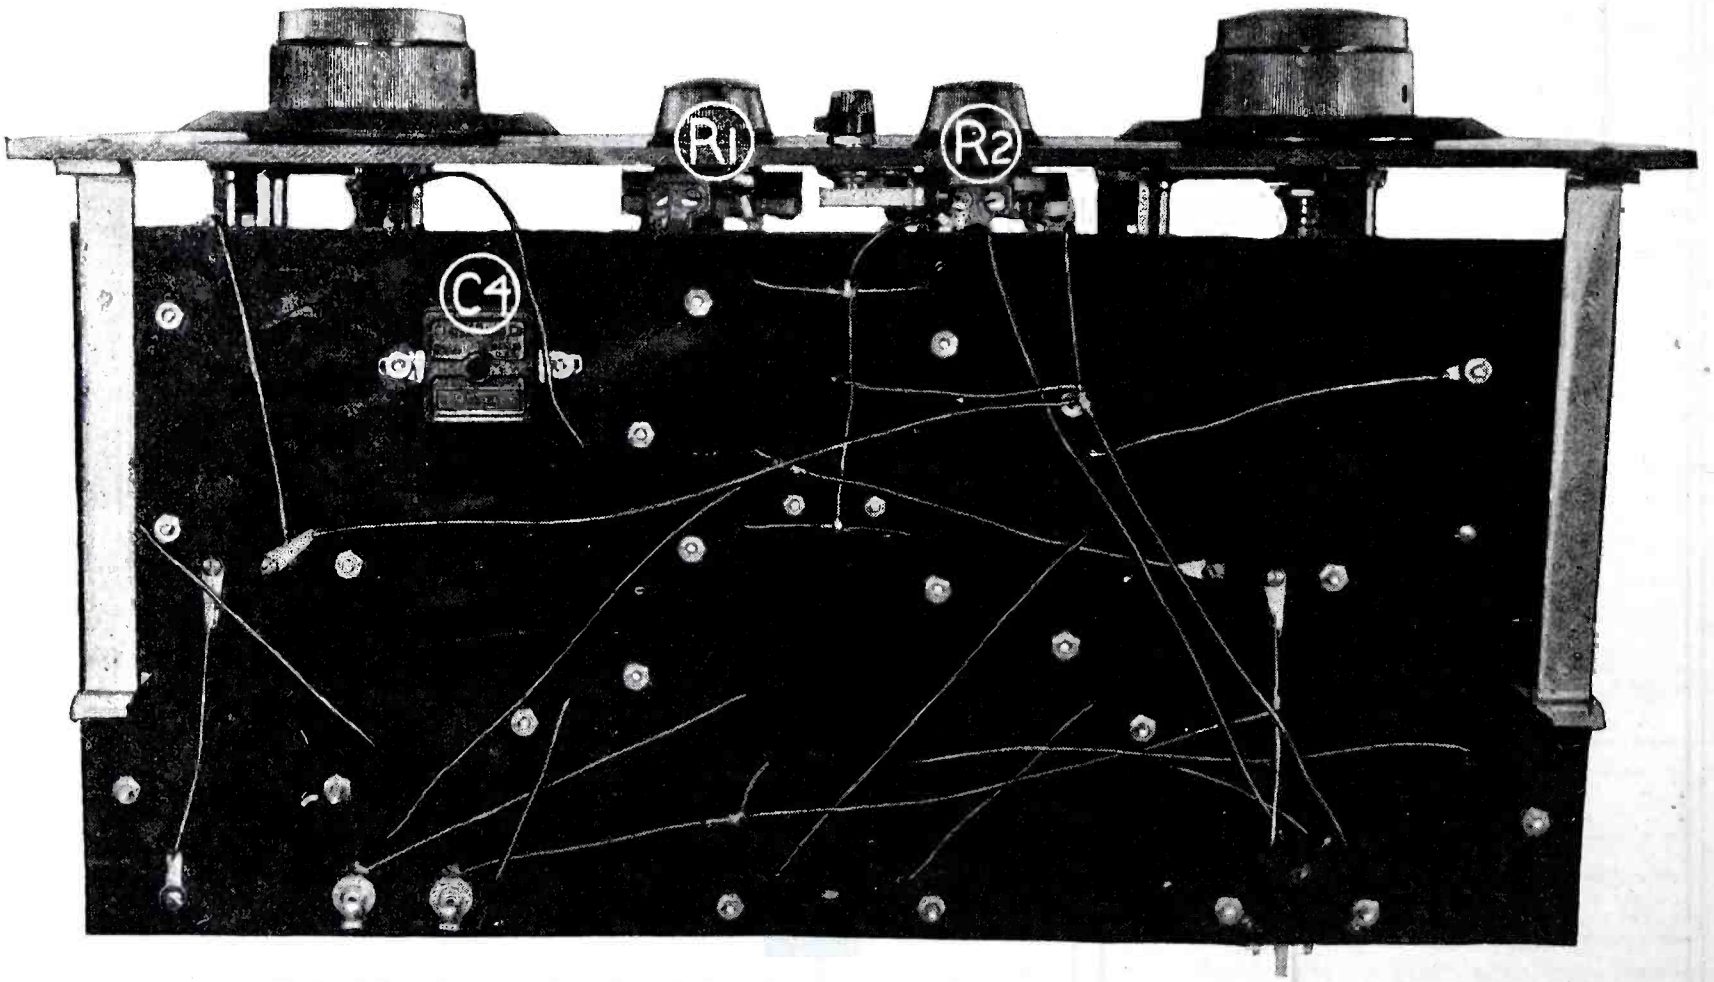


Photo of the set as seen from beneath the sub-panel. Note all wiring is made with flexible hook-up wire.

secondary. If the secondary coil is swung around to a 45 degree angle from the front panel, however, and the tickler is so adjusted that its winding is parallel with that of the secondary when the tuning condenser is set with its plates all in, then when the condenser is turned with its plates all out, the primary will have changed to an angle of 90 degrees from the secondary. It is therefore evident that the range of coupling obtainable with this automatic arrangement can be limited to any desired extremes. With the secondary set at a 45 degree angle the coupling will vary between zero and maximum when the condenser dial is turned throughout its range. If the secondary coil is turned to an angle of 30 degrees from the front panel the coupling will be limited to a smaller range and instead of decreasing to zero when the condenser plates are all out, it will only decrease about 60% from maximum.

The feed-back coupling can therefore be set to any desired range limitations. After the receiver is in operation a tentative preliminary adjustment of the coil angles can be made and then altered if necessary until the angle is found where the detector will

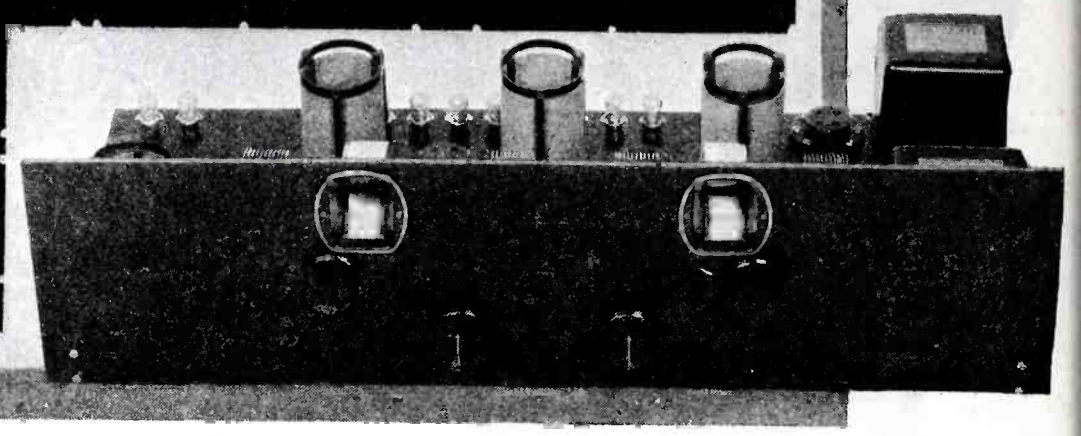
The above is the layout of the sub-panel drilling dimensions.

HOW TO BUILD THE AERO-DYNE-SIX



THERE are those of us who are always inclined to think, and to tell the world at large, that the older things are best. The good old days at the old "swimmin' hole," or the pies that mother used to make, may be better than these things are today. Mostly our memories and recollections are tinted by the rose colored haze of the passing years—a haze which for some reason magnifies the best of the past and obscures the less pleasant part.

But once in a while we do stumble across something that proves the value of the old order. In radio, for instance, resistance coupled amplification has taken its place during the last two seasons as one of the most popular forms of audio coupling, after having practically dropped out of existence for a span of several years. Experimenters started off at all sorts of tangents after the World War to find improvements over resistance coupling, mainly for economical reasons. There was a complete migration to transformer coupling eventually and the average fan came to believe that transformer coupling was the one and only practical coupling method. Then came the reduction in the cost of tubes and practical sources of high plate voltage supply, and with them came the resurrection of resistance coupling. Since that time transformers have been improved to a point where transformer coupling is equal to resistance coupling so far as quality of reproduction is concerned, and both methods are now in popular use.

A somewhat similar reversion to the old order is now noticeable in the radio-frequency end of some of our present day receivers. One or more stages of untuned. transformer coupling are to be found in many of the new receivers, particularly for use in coupling the antenna to the first R.F. tube. There is also a growing tendency to include resistances in the plate or grid circuits of the R.F. tubes to prevent oscillation. All of these schemes were popular a few years back but then became strictly taboo. There were reasons for the one time popularity of these features—and there were reasons for discarding them. Then later developments brought them back into logical usage. And so it goes.

PARTS REQUIRED FOR AERO-DYNE-SIX

1 Aero Kit No. U-16, consisting of four Aero coils, T1, T2, T3, T4.
1 Aero Foundation Unit, consisting of drilled front panel and sub-panel, sub-panel mounting brackets and full size blue-prints.
4 Hammarlund Type ML-23, .0005 mfd. Midline variable condensers.
2 Silver-Marshall drum dials.
2 Silver-Marshall No. 220 audio-frequency transformers, T5, T6.
5 Silver-Marshall No. 511 tube sockets, VT1, VT2, VT3, VT5, VT6.
1 Benjamin No. 9040, Cle-Ra-Tone tube socket, VT4.
1 Carter .00025 mfd. Molded Mica condenser, C5.
1 Carter .001 mfd. Molded Mica condenser, C6.
2 Tobe 1 mfd. by-pass condensers, C7, C8.
1 Tobe Tipon 2 megohm grid leak, R4. (GL)
1 Yaxley combination 6 ohm rheostat and battery switch R1(S).
1 Yaxley 1 ohm fixed filament resistance, R2.
1 Yaxley 200 ohm potentiometer, R3.
1 Polymet E-Z grid-leak mounting.
11 X-L binding posts with marker tags as follows: Aerial, Ground, A Battery+, A Battery—, C Battery— (2), B Battery 45+, B Battery 90+, B+ Amplifier, Speaker Positive, Speaker Negative.
1 package Kester radio solder.
1 package Cornish Braidite or Flexibus hook-up wire.

In the Aero-Dyne-Six receiver the old method is employed, of controlling sensitivity and stability in the R.F. amplifier through the use of variable grid potential. In the R.F. amplifiers of past years this method was generally used but the drawback then was in its use in conjunction with untuned stages and the resulting lack of selectivity. Where the individual stages were tuned this method did not offer adequate or satisfactory control over stability. Today, however, we have made tremendous advances in the design of radio-frequency coils and condensers with the result that stability is an easier thing to attain than heretofore and the old grid potential variation scheme can be used to good advantage in circuits designed for this purpose.

All of the R.F. stages in the Aero-Dyne-Six receiver are tuned and inasmuch as it employs three of these stages, plus a tuned detector stage—a total of four tuned circuits—there is ample selectivity. Thus the replacement of the single tuned circuit of the old receivers with four tuned circuits has eliminated one of the greatest objections to the old. Also the greater inherent stability of the radio-frequency amplifier in this new receiver eliminates the distortion which was so common in the old radio-frequency amplifiers.

The advantage of this Aero circuit lies largely in the extreme sensitivity obtainable through the use of a certain small amount of regeneration in the radio-frequency stages. This regenerative feature is under perfect control, however, and therefore does not offer the disadvantages which usually accompany regeneration in the R.F stages. A turn of the sensitivity control knob on the front panel will regulate the regenerative feature to any degree desired. In the reception of local stations it may be turned back to eliminate regeneration entirely and this resulting decrease in sensitivity largely eliminates reception of undesirable static and other external noises to permit the pure, sweet reception of the

broadcast programs, unadulterated by extraneous noise or interference.

But when the reception of signals from distant stations is desired the sensitivity required for such reception is easily obtained by turning up the sensitivity knob to the degree necessary to provide the proper sensitivity. Incidentally, in increasing the sensitivity in this way the selectivity is also increased from normal to an unusually high degree. The advantage of this double barrelled action will be appreciated when it is realized that ultra-selectivity is essential when it is desired to tune in weak distant signals through a barrage of powerful local stations.

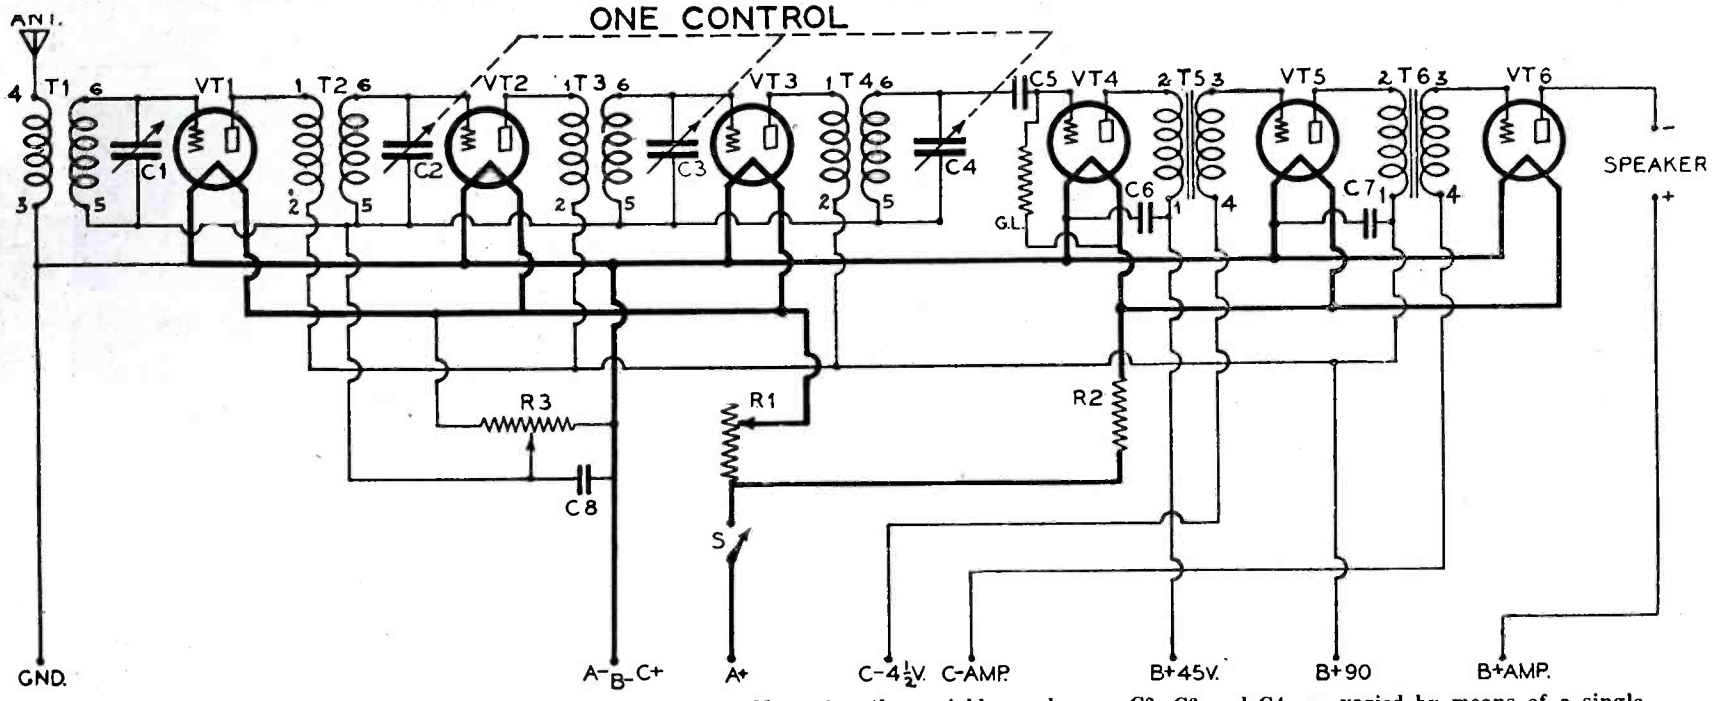
Construction of this receiver is so simple that it can safely be undertaken even by a beginner. There is no complicated shielding of any kind to interfere with the wiring and to generally complicate the construction, nor are there any constructional or wiring difficulties imposed by neutralizing or balancing systems. One circuit follows another in natural sequence, from the antenna to the output. In addition to the full size blue prints which are supplied with the foundation unit (see list of parts) the front panel and the sub-panel are furnished completely drilled. Thus the most tedious and painstaking jobs are taken care of in advance, and the chance of costly mistakes in drilling and layout is eliminated entirely.

Most of the wiring of the receiver is completed under the sub-panel. The plate and grid wiring to each tube is done above the sub-panel, however, to allow these connections to be as short as possible. A great deal of the wiring can be completed before the sub-panel is mounted on the front panel.

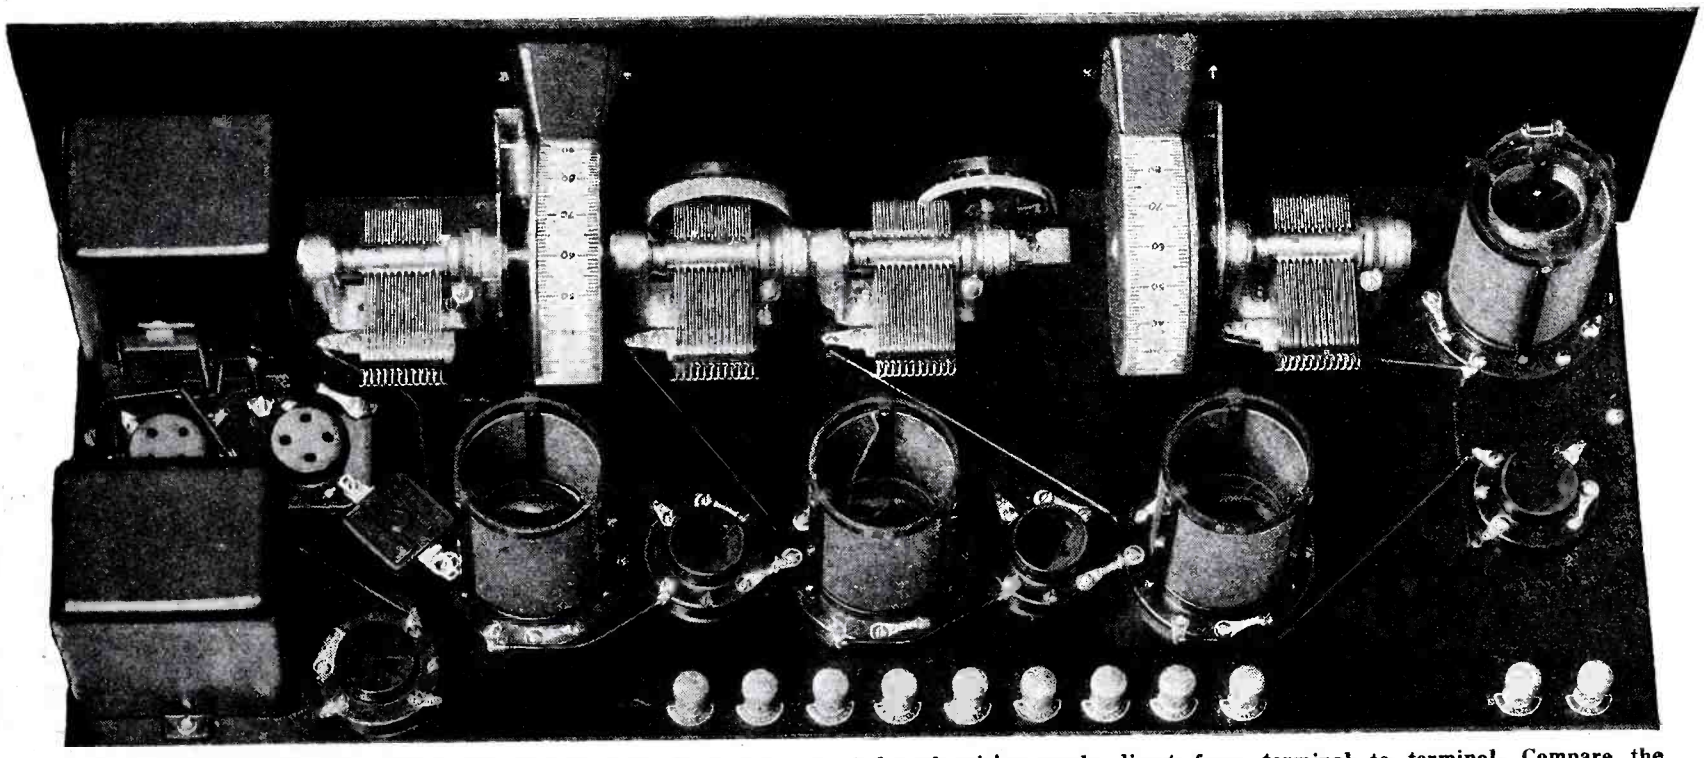
Simplicity of operation is an important consideration in a receiver, particularly if it is to be operated by inexperienced members of the family.

Tuning of the Aero-Dyne-Six is therefore limited to two knobs which operate the drum dials and the four tuning condensers. The left hand knob, which is located just below the left hand dial window, controls the condenser, C1, which tunes the input circuit of the first R. F. tube. This circuit is individually tuned to permit exact tuning regardless of the size and characteristics of the antenna used with the receiver.

The right hand tuning control operates the three condensers C2, C3 and C4, which are grouped on a single shaft for simultaneous control. This



Schematic wiring diagram of the improved Aero-Dyne-Six. Note that the variable condensers C2, C3 and C4 are varied by means of a single control. Rheostat R1 controls the R.F. stages, while the fixed resistor R2 is used for the detector and A.F. tubes.



A back panel view of the receiver showing how the parts are mounted and wiring made direct from terminal to terminal. Compare the above photo with the instrument layout on a following page.

This radio-frequency amplifier is unusual in that it requires no preliminary adjustments of any kind. There are no neutralizing condensers to be adjusted, critical fixed resistance values to be determined, nor balancing adjustments of any kind.

"ganging" is permissible in this receiver because the coils and variable condensers used are built to such a high degree of accuracy as to tune exactly alike. Tuning them all with a single control is therefore the natural and logical arrangement.

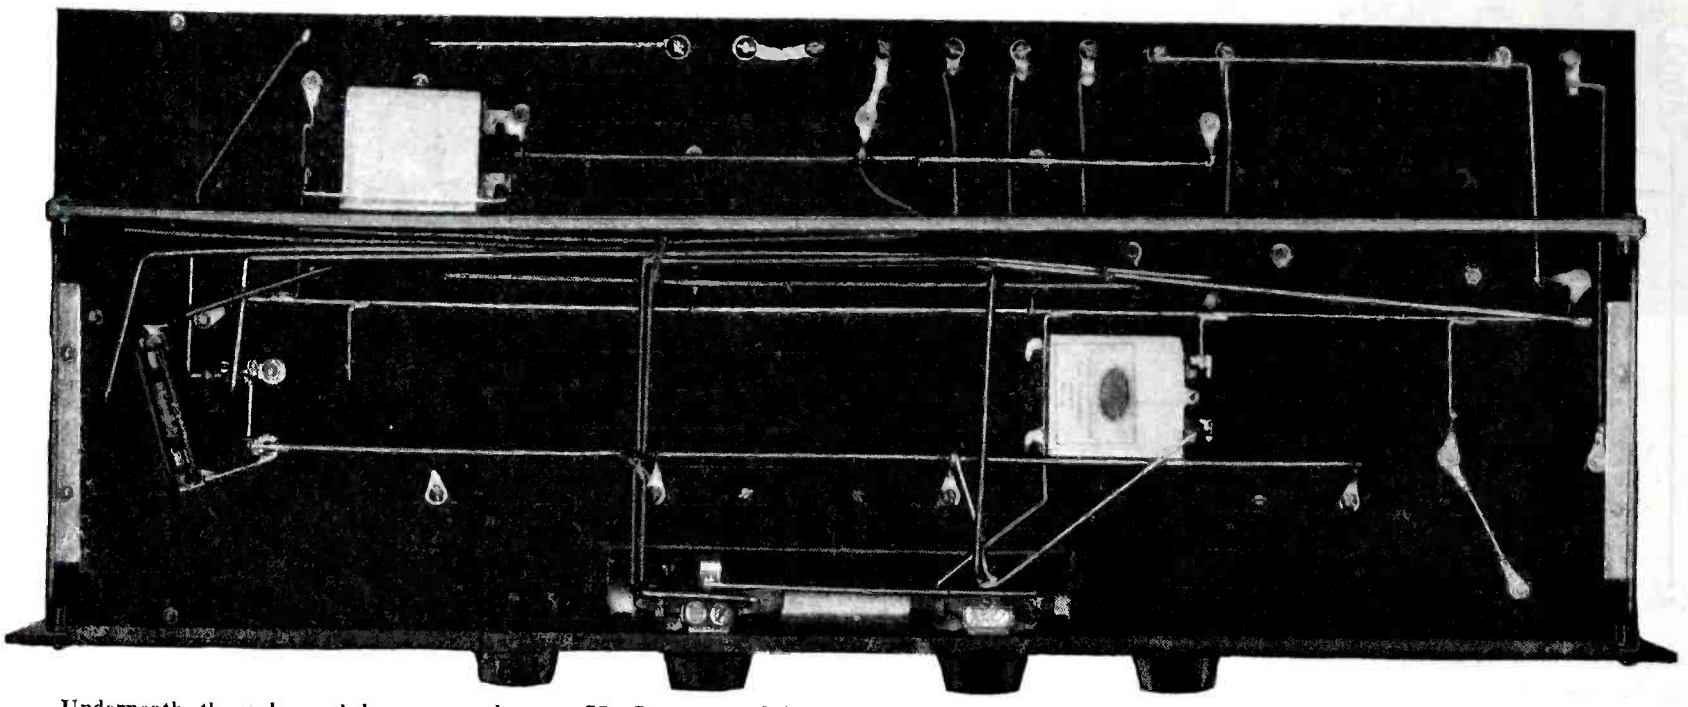
In addition to the two tuning knobs there are two other knobs conveniently placed on the front panel to provide means for controlling the sensitivity and volume of the receiver. To many fans these two terms may seem to mean about the same thing. Actually, however, there is an important difference. In increasing sensitivity the ability of the receiver to respond to weak electrical impulses is tremendously increased. This brings in distant stations—but it also brings in much undesirable noise due to static, electrical disturbances of one kind and another, from far and near. On the other hand, if the sensitivity is low but volume is high, the local stations will come in with plenty of "kick" and without any disturbing noises. By the inclusion of both sensitivity and volume controls in this receiver it is possible to bring in distant stations when desired, or when local reception is desired it may be had without accompanying noise.

The volume control is included in the filament circuit of the radio-frequency amplifier and is therefore capable of regulating volume without in any way affecting the quality of reproduction. The quality, by the way, is excellent, as will be recognized from the fact that transformers of the new type with a fine amplification curve are used. Amplification, in effect, is practically constant at all tone frequencies and the reproduction is therefore life-like and natural. The deep bass notes roll out of the loudspeaker with most stirring realism, and the higher frequencies are brought out in their full brilliance.

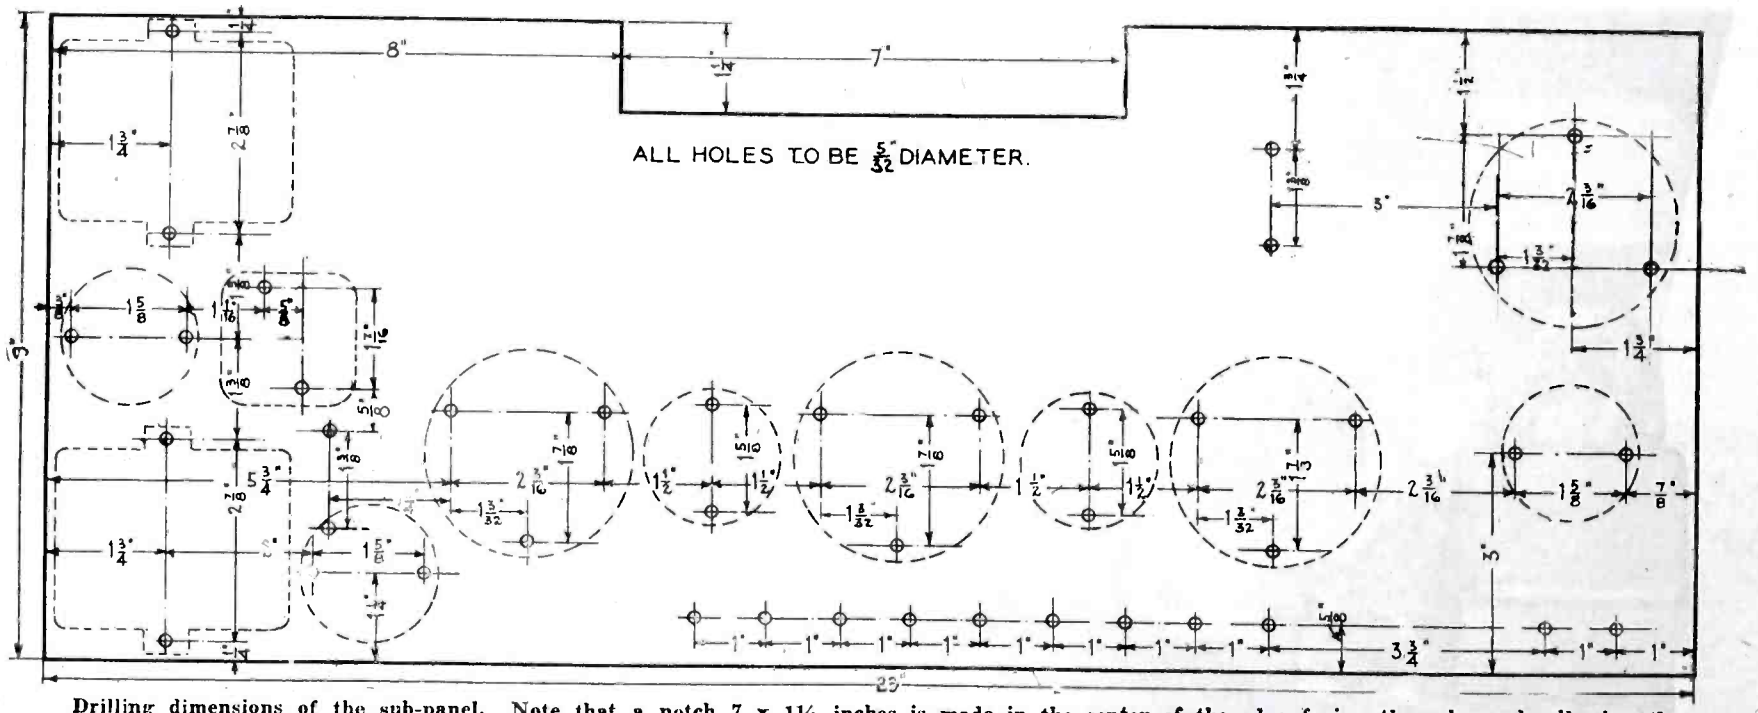
The audio transformers used are not alone enough to insure perfection in tone quality, of course. The tubes play an equally important part. For this reason a CX 371 valve is used in the last audio stage. In addition, the filaments of both the first and second audio tubes are controlled automatically by a fixed resistor unit which always keeps the filaments at their proper operating voltage, and thus insures normal functioning.

The actual construction of the receiver is so fully shown in the illustrations that no detailed verbal instructions are necessary. It is only necessary to attach the various instruments on the panels, in the positions shown in the photographs. The holes for the mounting screws are already drilled so the exact location of every instrument is automatically fixed.

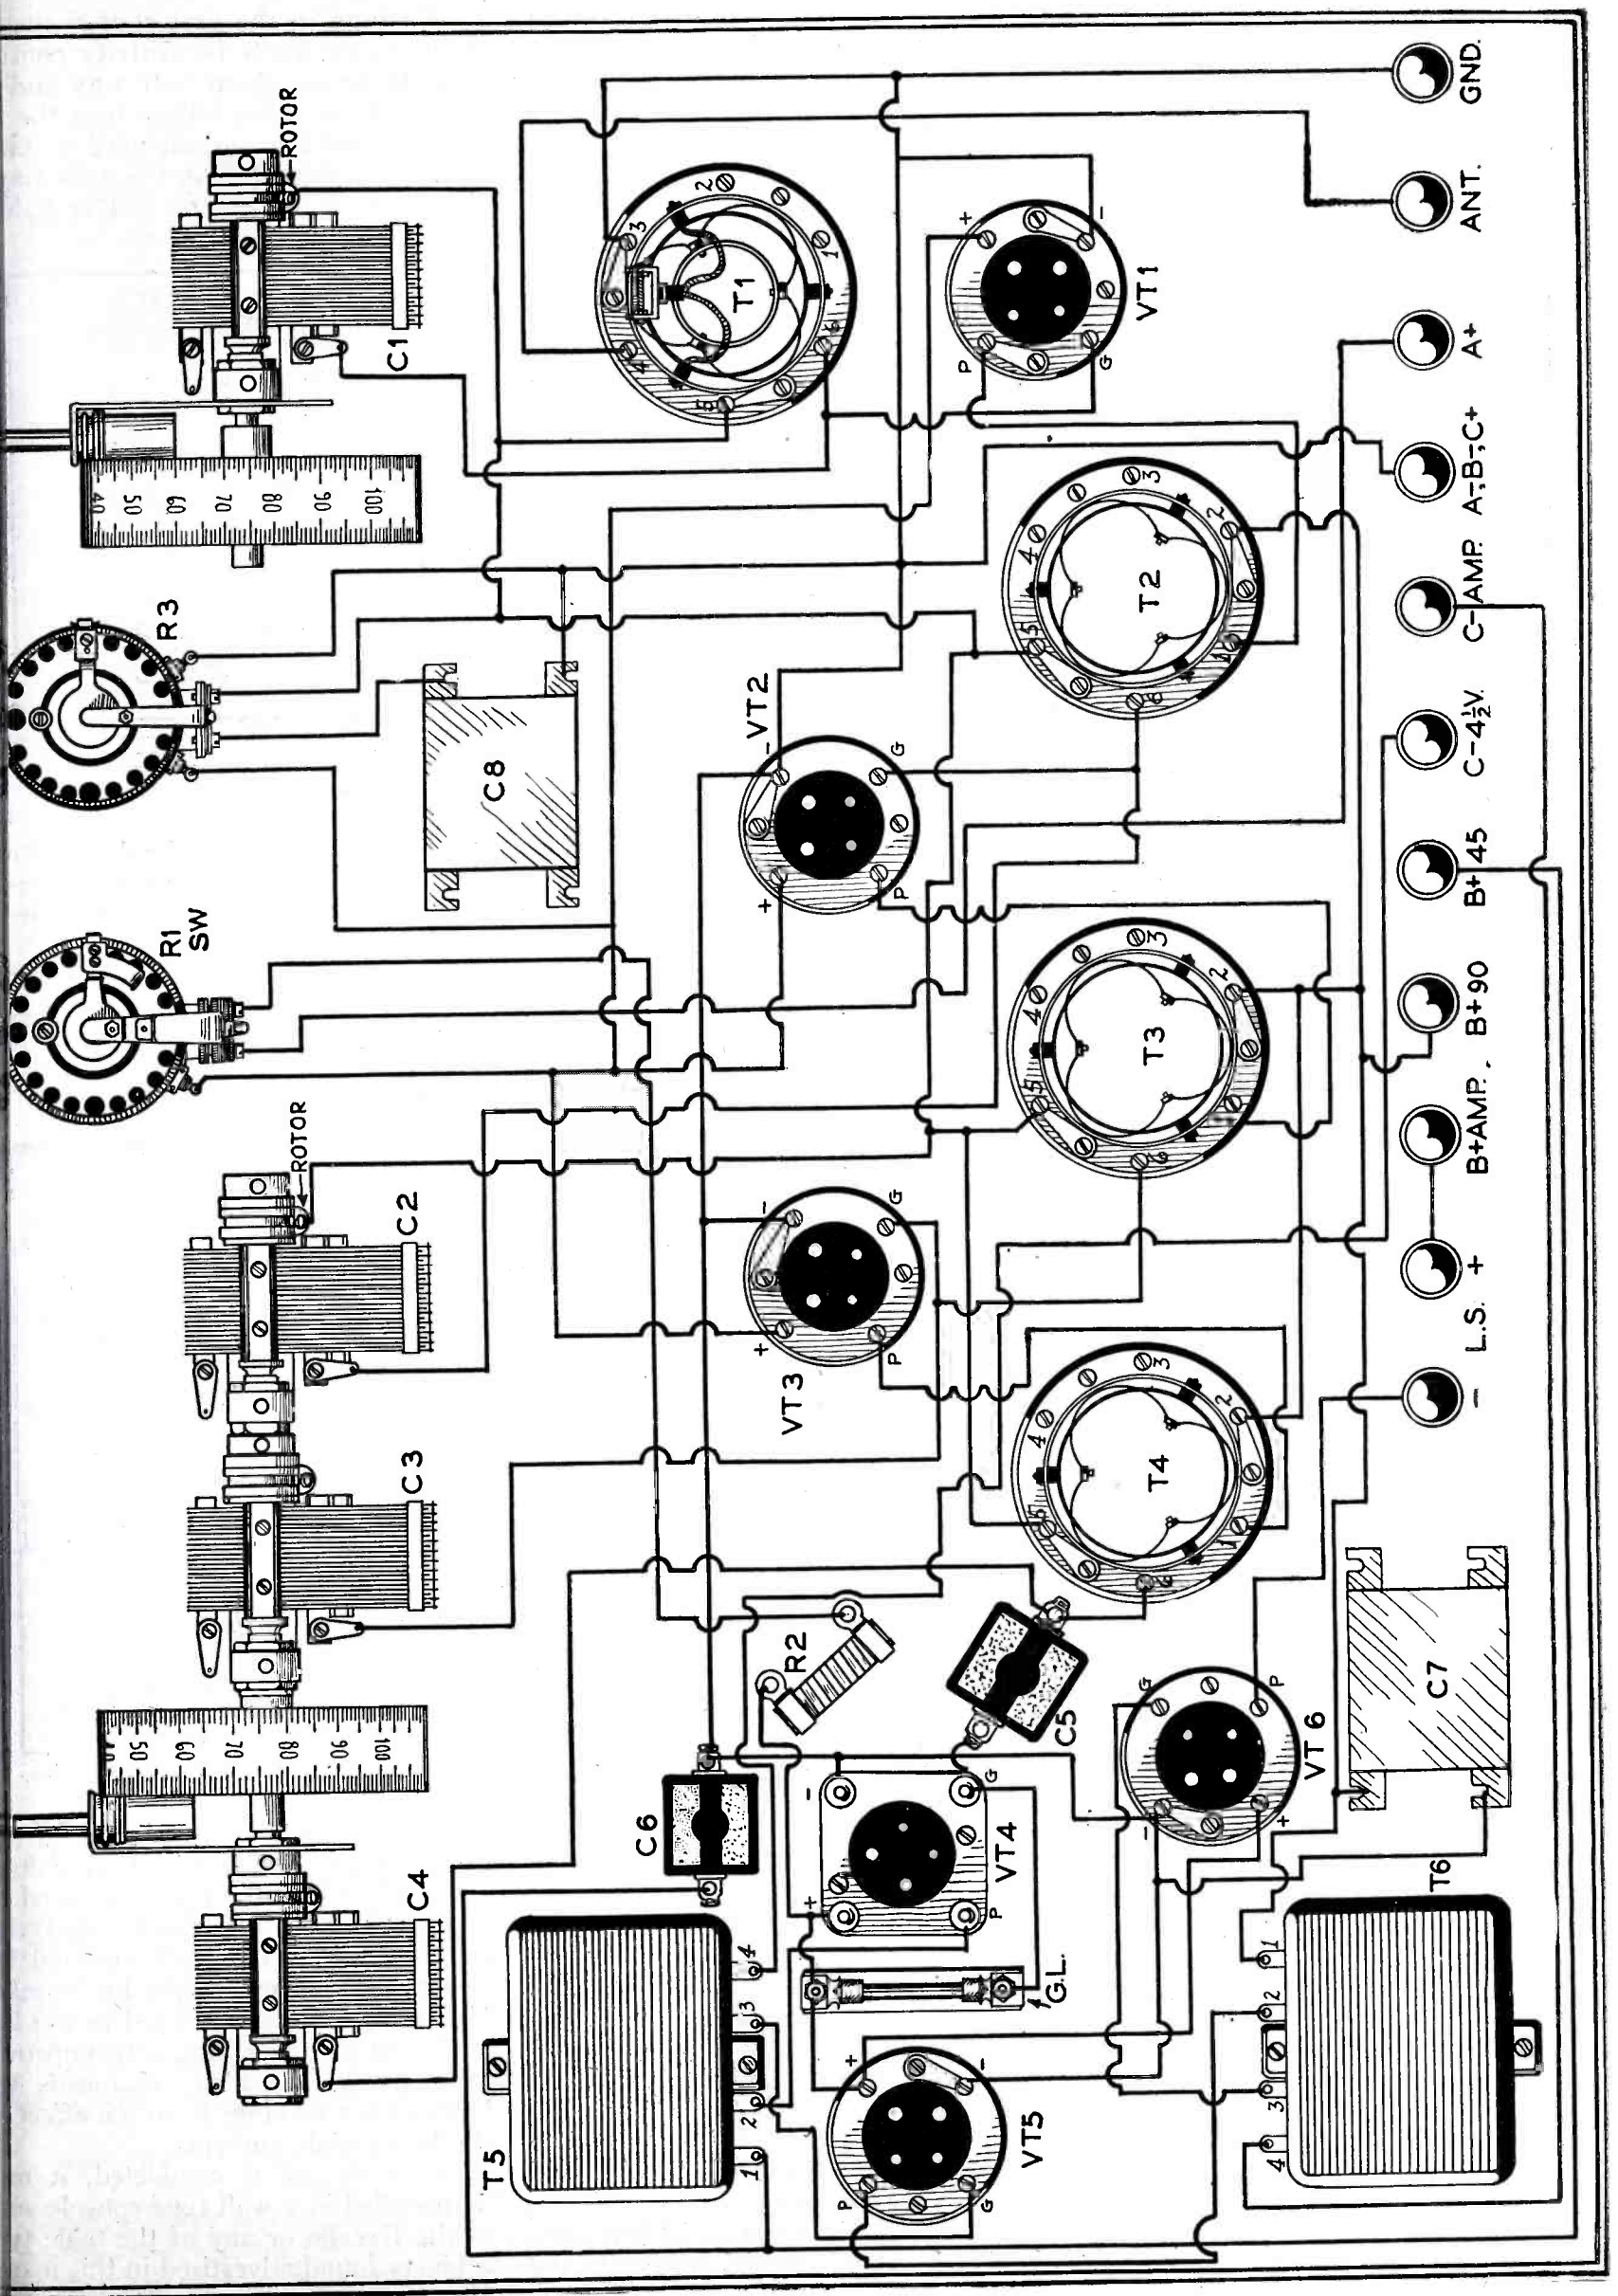
In wiring the receiver the free use of soldering lugs is recommended. Many of the connections can be made by means of two lugs, without any wire



Underneath the sub-panel by-pass condensers C7, C8 and grid leak are mounted. The strip of bakelite completely across the bottom is fastened to the ends of the two sub-panel brackets to give additional rigidity to construction.



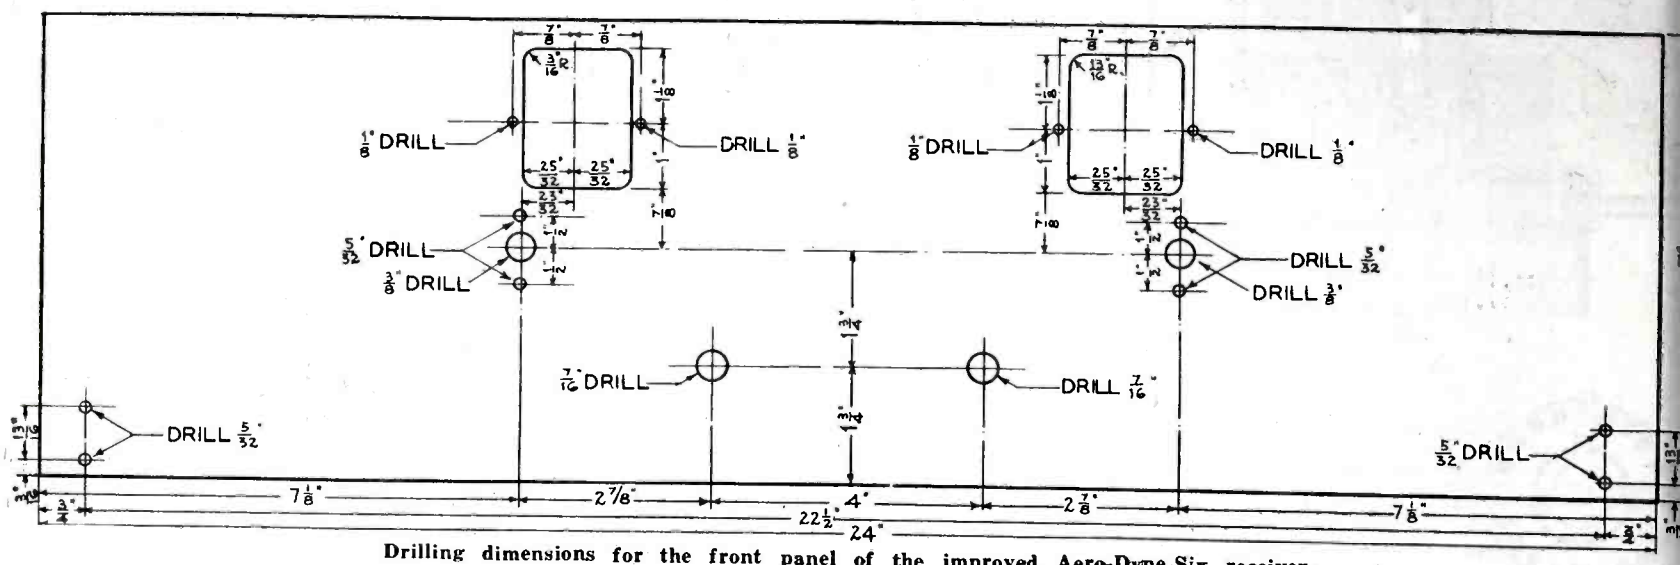
Drilling dimensions of the sub-panel. Note that a notch 7 x 1¼ inches is made in the center of the edge facing the sub-panel, allowing the rheostat and potentiometer to be mounted on the front panel.



at all. But in any event the use of lugs insures a tight connection under screw heads, and permits a good solid job of soldering to be done. Lugs about ¾" long are a convenient size to use and they are easier to work with than the smaller sizes.

single one, then if there should be anything wrong with the battery circuits it will be noted at once, without any chance of burning out more than one tube. This one tube should be inserted in the first socket at the left (looking at the receiver from the

To tune in the first station the p tentiometer knob (sensitivity contro should be set about half way and t rheostat the same. Then turn the tu tuning knobs in unison until a stati is heard, then adjust the two tuni controls to resonance. The volur



Drilling dimensions for the front panel of the improved Aero-Dyne-Six receiver.

A careful study of the photographs will show that in many instances the mounting screws which extend through the sub-panel from the sockets and coils are used for carrying connections through the sub-panel. Thus, by means of a lug, one of the coil terminals is connected to the top of one of the mounting screws, then the extension of the connection under the panel is made from the bottom end of the mounting screw.

Upon completion of the wiring a careful recheck of the entire circuit should be made to be sure that all is as it should be. Then, with the rheostat turned all the way off, the batteries, antenna, ground and loudspeaker may be connected up.

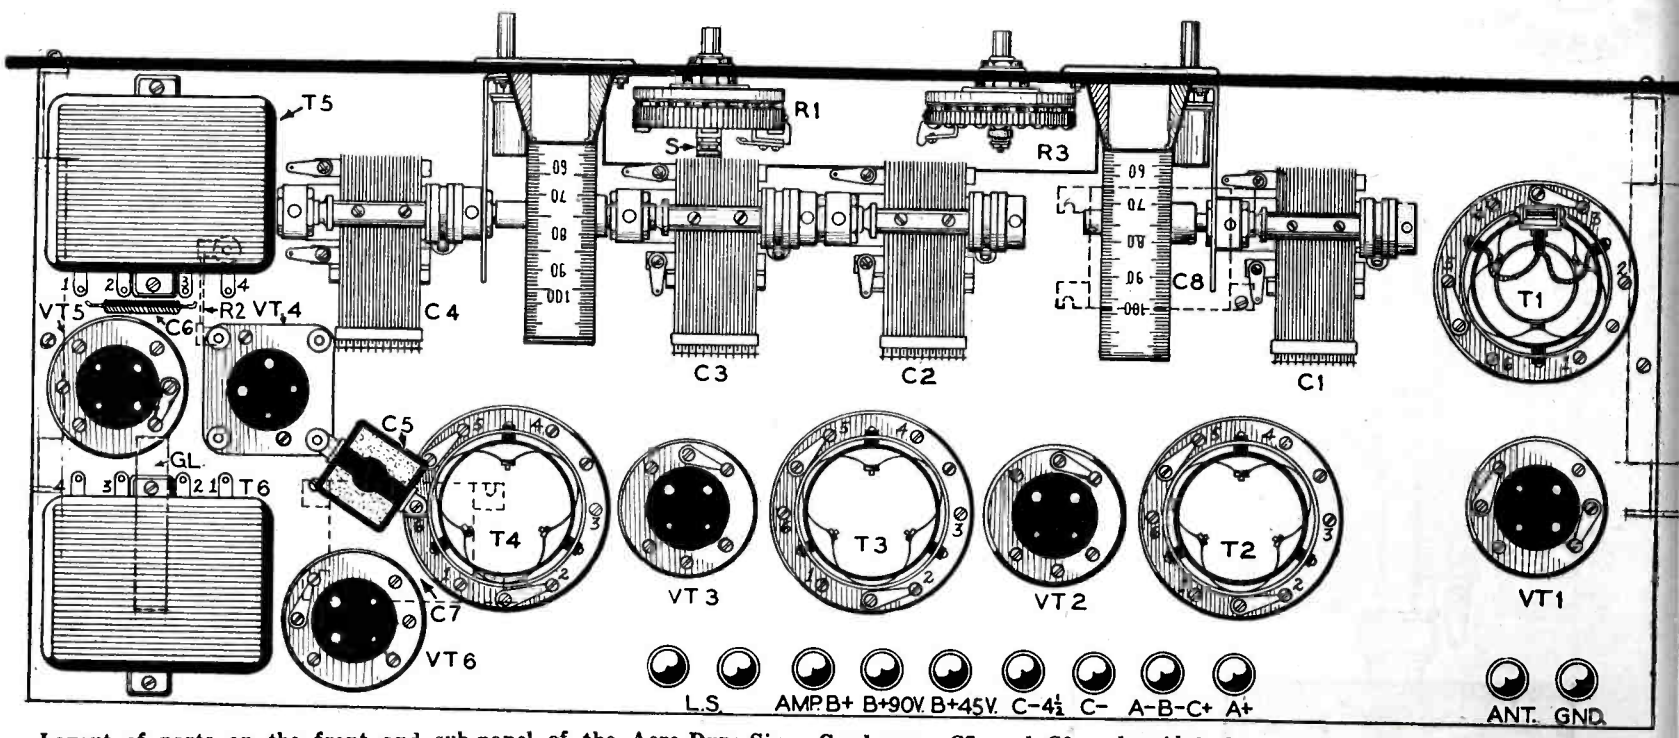
Before placing all the tubes in their sockets it is advisable to start with a

front) and the rheostat should be turned on only enough to make contact between its slider and resistance winding. If everything is O K to this point, the rheostat should be turned off again and the balance of the tubes placed in their sockets. Tubes of the 301-A type are placed in all sockets but the one at the rear edge of the sub-panel. In this socket is placed a 371 type power tube. This is the socket for the last audio stage. The others are from left to right: 1st. R. F., 2nd. R. F., 3rd. R. F., detector, 1st audio.

With the tubes in position, the detector and the two audio tubes should light to normal brilliance as soon as the rheostat knob is slightly turned to the right. The three R. F. tubes will light dimly at this position of the rheostat but will increase in brilliancy as the rheostat is turned further to the right.

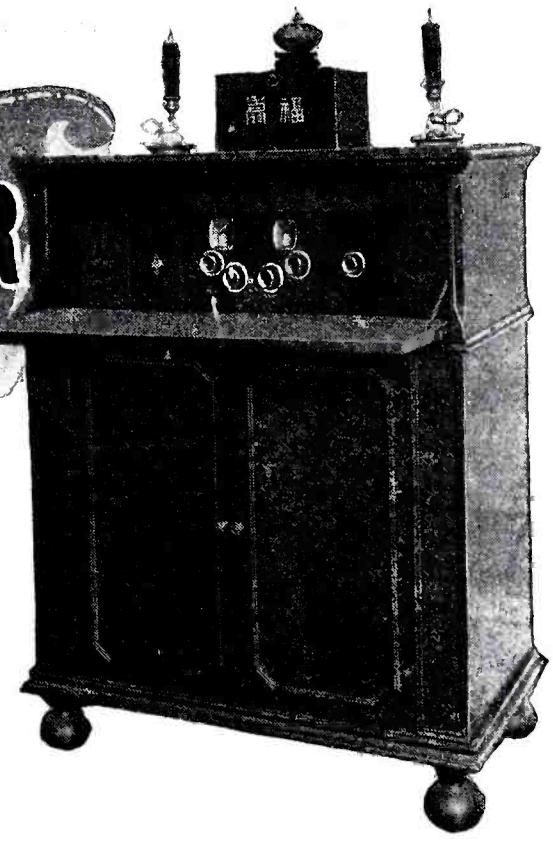
control and sensitivity knobs may nc be adjusted and a little experimentir will show the adjustment of both f maximum effectiveness.

If unusually great volume of repr duction is desired it can be obtain by the use of 180 volts for the pla



Layout of parts on the front and sub-panel of the Aero-Dyne-Six. Condensers C7, and C8 and grid leak are mounted beneath the sub-panel.

THE PERFAM A-C FOUR



FOR a long time it has been the dream of engineers to operate a radio receiving set direct from the light socket. Today this is easily possible. A.C. tubes have not sprung up over night. In fact they have been in operation in various laboratories for a number of years. There are two kinds of A.C. tubes; those that have a heavy filament which operates direct from the light socket through a step down transformer and those which have a heater which operates from A.C. and which, in turn, heats a cathode which supplies the electron emission which the radio set actually makes use of. Both kinds of tubes are perfectly satisfactory and when used in a set properly no hum will be heard.

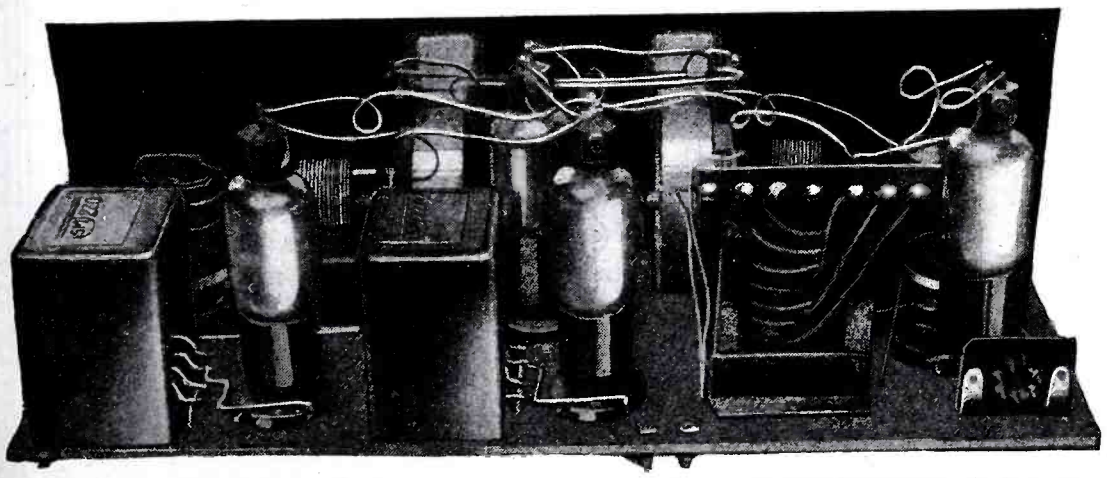
For the radio set builders who like to try out the new wrinkles in radio, the Perfam Four is offered for their approval. This receiver is low in price and many of the other improvements in radio apparatus are used.

The circuit is nothing new but does include a high quality audio. This is the most important part of any receiving set and is so overlooked by manufacturers of high grade sets which sell for a great deal more money.

Of the different A.C. tubes available, the Sovereign tubes are used in this receiver. They are of the heater type. The alternating current from the house supply, normally 110 volts, 60 cycles, is applied to a step down which reduces this voltage to approximately 3 volts.

LIST OF PARTS

1 Birnbach No. 60 tuner, L2
1 Birnbach No. 60 radio frequency coil, L1
4 Sovereign AC tubes
1 Sovereign special heater transformer, T3
1 Sovereign power switch, PS
2 Tobe No. 301, 1 mfd. condensers, C5, C6
1 Tobe 2 meg. leak, R1
1 Tobe .00025 mfd. grid condenser, C3
1 Tobe .0005 mfd. condenser, C4
4 Silver-Marshall No. 511 tube sockets
1 Pair Silver-Marshall No. 540 mounting brackets
2 Silver-Marshall No. 805 vernier drum dials
1 Silver-Marshall No. 275 radio frequency choke coil, CH
2 Silver-Marshall No. 220 audio transformers, T1, T2
2 Amsco No. 526 variable condensers, C1, C2
1 Jewell No. 190 A.C. voltmeter 0-5 volts (optional)
1 Clarostat (power type), R3
1 Clarostat (universal range), R2
1 Yaxley cable plug
1 Electrad Phasatrol, PH
50 Feet Acme Celatsite hook-up wire
1 Excello console or Iveyline table type cabinet
1 Formica panel 7x21x$\frac{3}{16}$"
1 Formica sub-panel 9x20x$\frac{3}{16}$"
1 Package Kester radio solder
Assortment of machine screws, nuts, etc.



A rear panel view of the Perfam A. C. Four as it appears when completed with all tubes in the set.

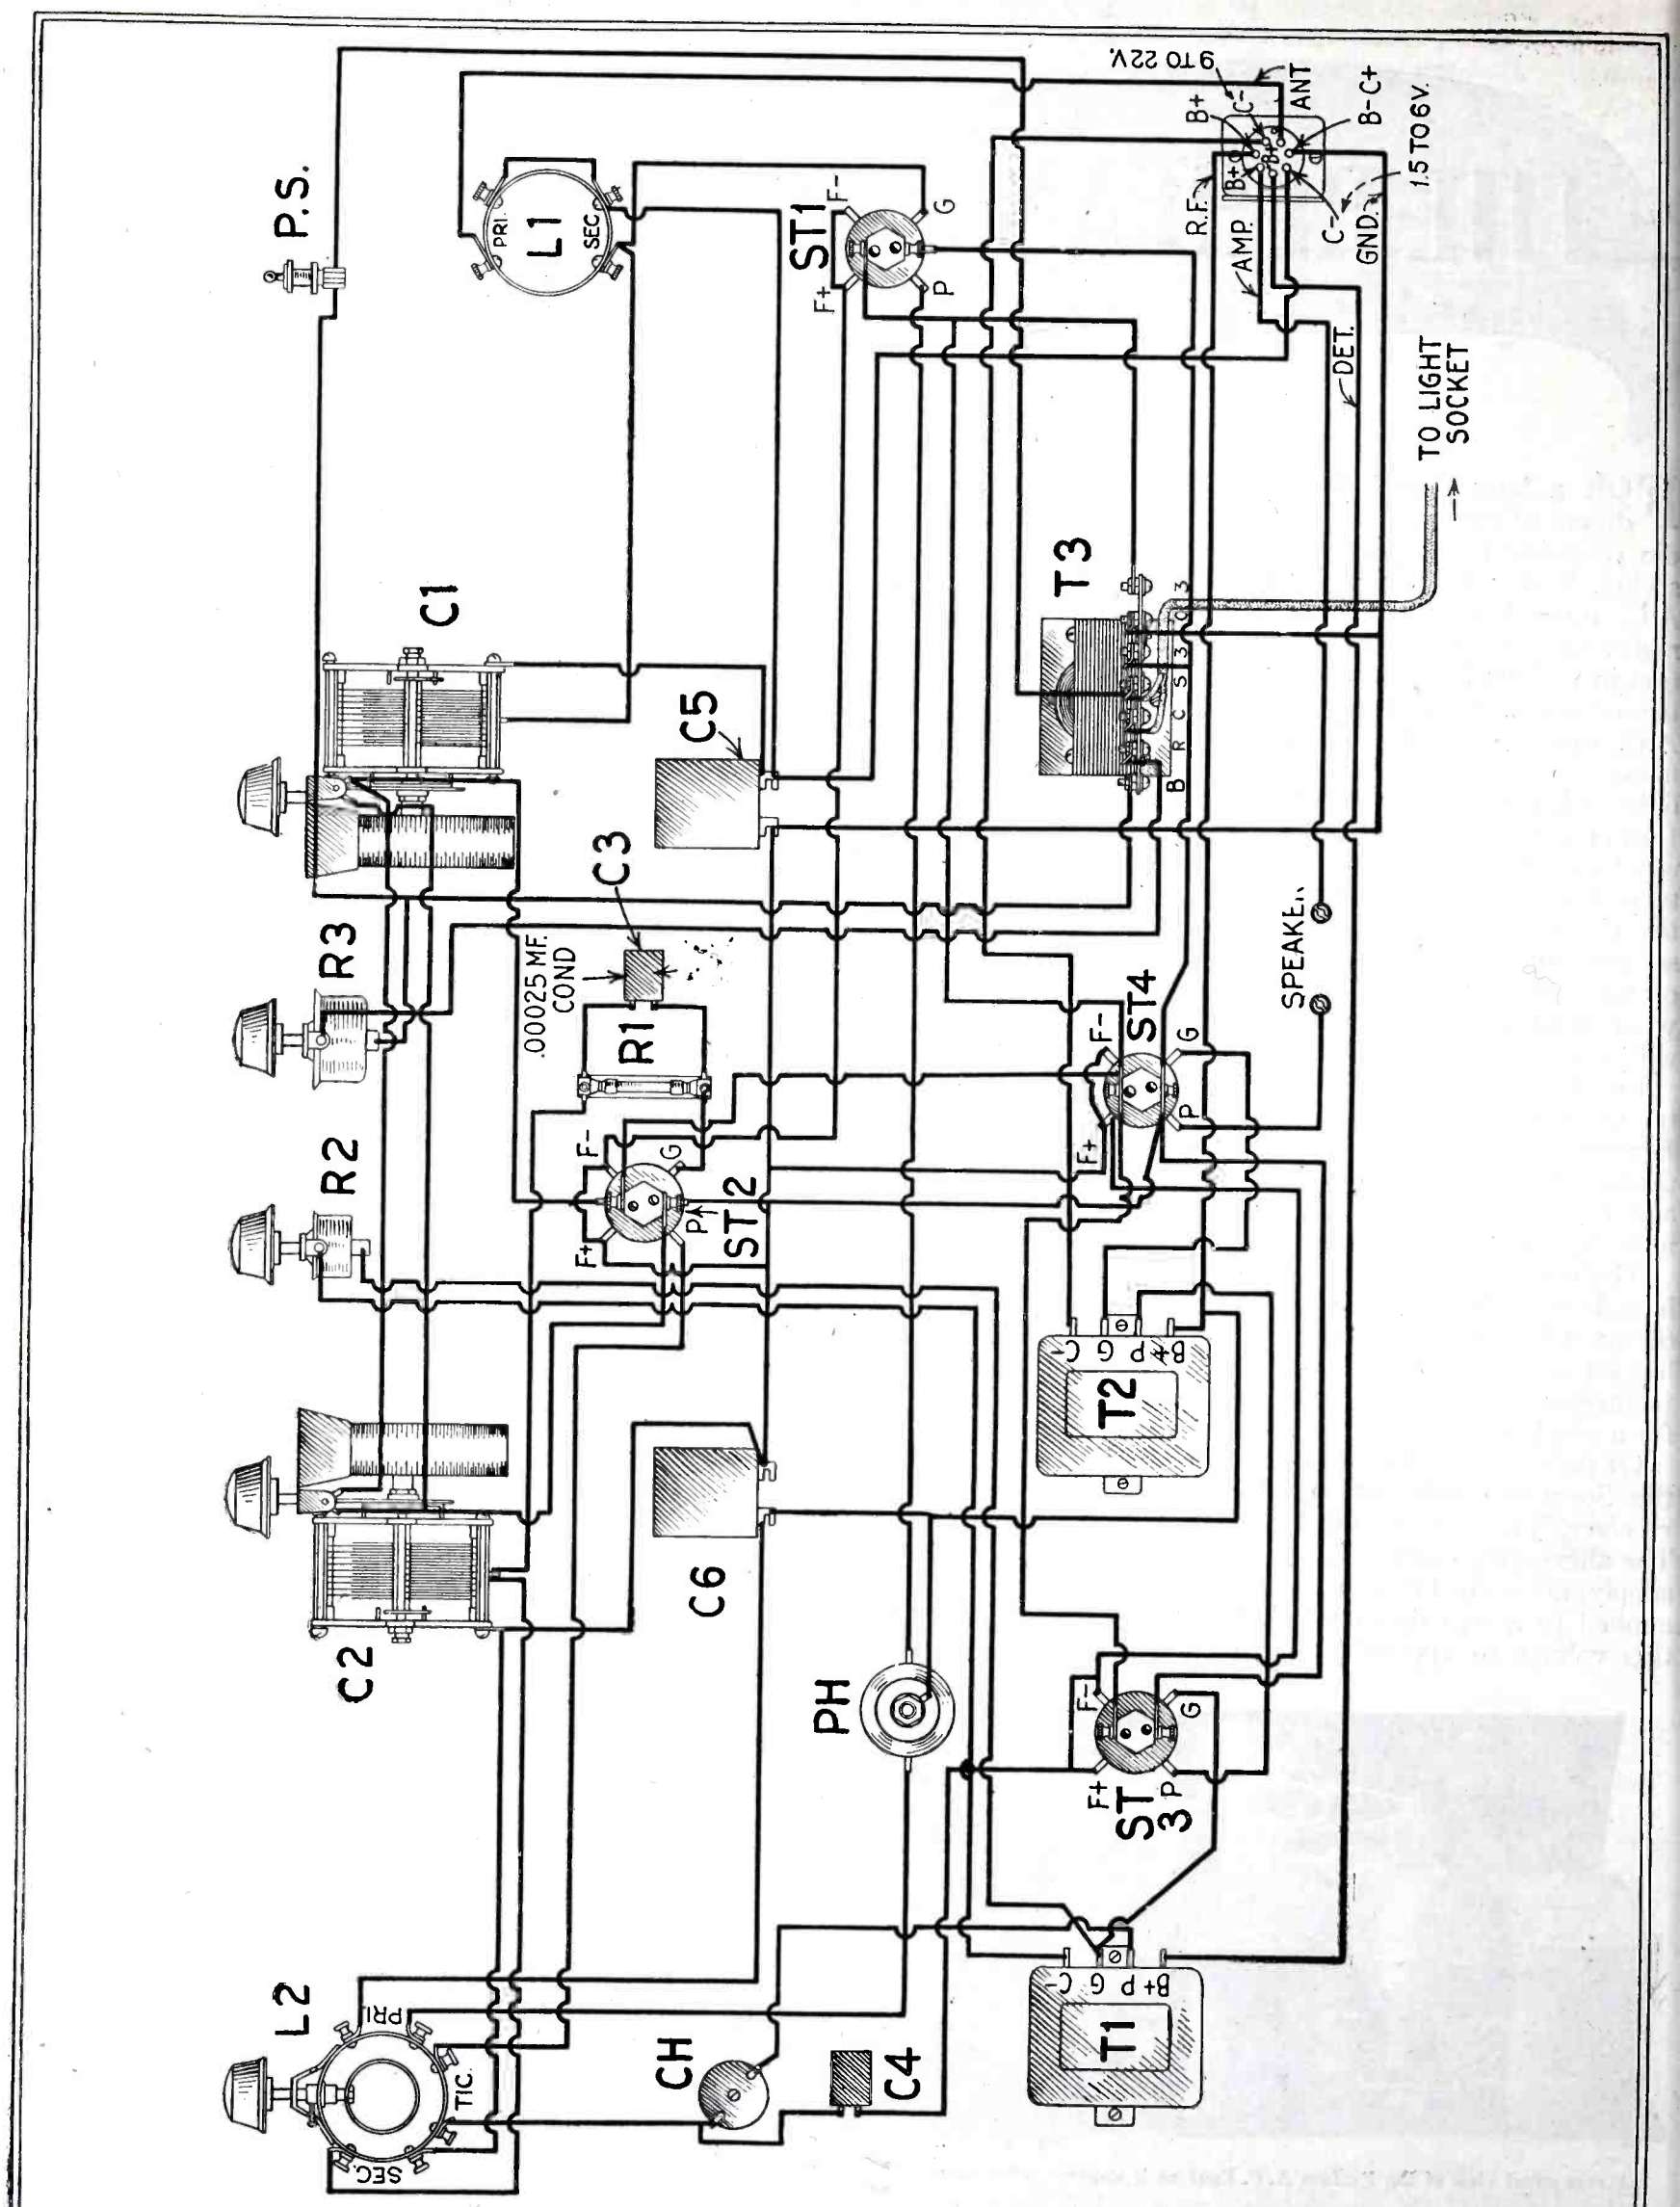
The tube heater units are then connected across the 3 volts in multiple as shown in sketch of transformer and tubes.

When this alternating current flows through the heater of a tube, it becomes hot and heats up a special cathode which, when hot, emits electrons and acts similarly to an ordinary filament in a 201A type tube. A low resistance power rheostat is connected in series with the stepdown transformer to regulate the A.C. voltage. The Sovereign tube, according to the manufacturers, has a normal life of 1500 hours and is operated at a comparatively low temperature. Thus the electron emission is practically constant for the life of the tube.

The selection of circuit for the Perfam Four was not difficult as it has been found that a stage of one tuned R.F. and a tuned detector followed by two stages of audio amplification is generally an easy circuit to construct with the suitable radio apparatus available, and its simplicity allows the average radio home builder no trouble.

When the radio frequency circuit is properly neutralized it is more stable, and for that reason a Phasatrol is used for this purpose. The Phasatrol is very easy to adjust and only requires a long wooden screw driver, which can be made from any piece of wood in a few moments with a sharp knife, and when properly adjusted, as will be explained later, will eliminate tendency to radio frequency oscillation or distortion.

As it is desired to keep the cost to minimum and yet use good merchandise, the tuning coils selected are the Birnbach R.F. No. 60 and Birnbach No. 60 tuner. These coils when tuned with Amsco .0005 mfd condensers will cover a wave length range of 200 to 550 meters, sufficient to cover the broadcast range. An outside or inside antenna may be used and no shielding is necessary although the stepdown transformer is mounted on the subpanel directly in back of the R.F. tuning unit. Another new feature, but no additional expense, is the use of S-M drum dials. They present a neat appearance, are easy to tune, and allow



re room behind the front panel as condensers are mounted on a horizontal plane. The dials may be illumin-

it is doubtful if you can purchase a three volt lamp; but this is not a drawback as enough light will show when

controlling the volume be employed, as the usual method of turning down the filaments in a receiver will not suffice

The A-C Operated Shielded-Six

by McMurdo Silver

IT has been said that complete light-socket operation of broadcast receivers will be to radio exactly what the self-starter was to automobile development. The self-starter lifted the automobile out of the technical-hobby class and made it a public utility; and today it is a necessity. It is easy to understand this when it is realized that the self-starter has adapted automobiles to use by women, under varying climatic conditions, and in urban surroundings; this would have been utterly impossible if each and every car had to be cranked every time it was started.

And, as one looks at the illustration at the top of page 95, showing a six-tube, tuned-R.F. receiver whose entire "A-B-C" power plant is a small unit less than seven inches square, absolutely dependable in operation and entirely free of servicing troubles—light-socket operation looks absurdly simple. But let it be remembered that this final simplicity has been achieved only after years of laboratory work and that, at this writing, the receiver to be described is the only light-socket-operated set, using the new A.C. tubes, which is available to the home builder. The milestone it represents along the road of progress is an important one indeed, for it marks the end of servicing trouble, acid-laden storage batteries, liquid chargers, dying "B" batteries and the necessity for the knowledge involved in the care and operation of such paraphernalia.

The new Improved A.C. Shielded Six is in itself an unusual and excellent receiver, for it incorporates one of the few designs of sufficient merit to have enjoyed public popularity for over two years, though each year it has been improved and developed. This past popularity assures the builder that it is a thoroughly dependable receiver from which all "bugs" have been thoroughly eliminated. The Improved Shielded Six consists of three stages of tuned-radio-frequency amplification, a dete tor and two stages of audio amplific tion with a push-pull power outp stage. The entire assembly is mad upon a pressed-steel chassis, to th front of which is attached a beauti fully-decorated bronze panel carryin

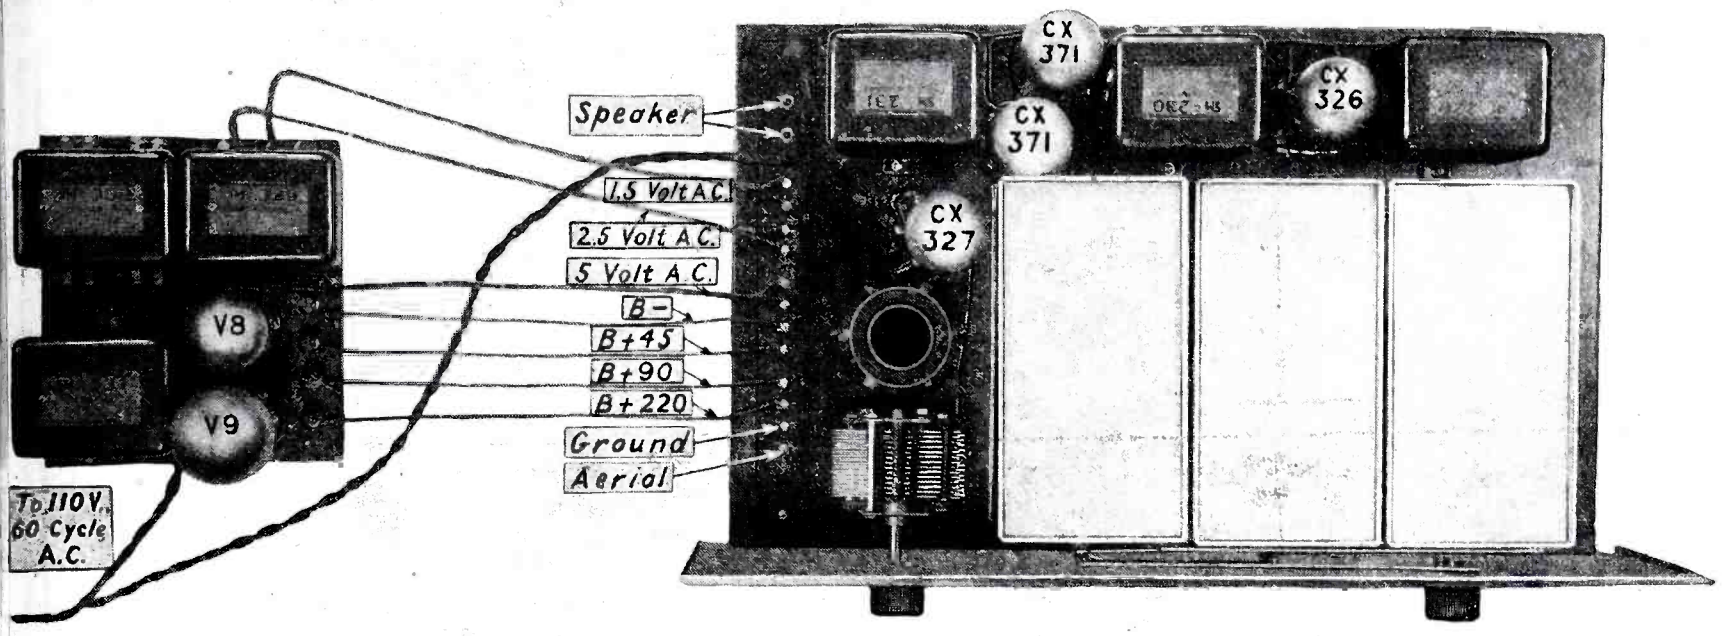
PARTS REQUIRED FOR A. C. OPERATED SHIELDED-SIX

- 3 Silver-Marshall stage shields
- 2 Silver-Marshall type 316A variable condensers (C2-C3)
- 2 Silver-Marshall type 316B variable condensers (C1-C4)
- 1 Silver-Marshall type 116A tuning coil (L1)
- 3 Silver-Marshall type 118A (matched) tuning coils (L2-3-4)
- 4 Silver-Marshall coil sockets to accommodate plug-in coils (L1-4)
- 4 Silver-Marshall tube sockets for five-prong tubes (V1-4)
- 3 Silver-Marshall tube sockets for standard four-prong tubes (V5-7)
- 1 Silver-Marshall A.F. transformer (T1)
- 1 Silver-Marshall A.F. transformer, push-pull type, input model (T2)
- 1 Silver-Marshall A.F. transformer, push-pull type, output model (T3)
- 1 Silver-Marshall triple link motion, (connects condensers C2, C3 and C4)
- 1 Carter .002 mfd. fixed condenser (C5)
- 3 Carter .5 mfd. each, No. 105 fixed condensers (C6-7-8)
- 1 Carter 6000 ohm Potentiometer, model HW6000 (R1)
- 2 Carter tip jacks (LS)
- 1 Carter 600 ohm fixed resistor, model H600 (R2)
- 2 Carter 1000 ohm fixed resistors, model H1000 (R3-R4)
- 2 Frost tapped resistors, model FT64 (R5-R6)
- 1 Kroblak or Ward-Leonard 5000 ohm fixed resistor (R7)
- 2 Marco vernier dials
- 1 Silver-Marshall terminal strip with terminals No. 636 AC
- 1 Silver-Marshall front panel, brass, drilled and engraved, 7 x 21"
- 1 Silver-Marshall steel chassis, 12 x 19¼ x 1¼"
- 1 Excello console or Fritts cabinet.
- 1 Carter single pole, double throw type antenna switch (S1)
- 1 Carter on-off switch (S2)
- 1 Polymet 250,000 ohm fixed resistor and mounting (R8)
- 1 Silver-Marshall type 329-A power transformer (PT)
- 1 Silver-Marshall type 331 choke coil unit (CH)
- 1 Silver-Marshall type 511 filter condenser (CD)
- 2 Silver-Marshall tube sockets, standard four-prong type
- 1 Silver-Marshall type 659 tapped resistor (R9)
- 1 Silver-Marshall steel base, 7 x 7", type No. 654
- 4 Cunningham A.C. heated cathode vacuum tubes, type No. 327 (V1-4)
- 1 Cunningham Raw A.C. vacuum tube, type No. 326 (V5)
- 2 Cunningham vacuum tubes, type No. 371 (V6-7)
- 1 Q.R.S. full-wave filamentless type rectifier tube (V8)
- 1 Cunningham voltage regulator tube (V9)
- 1 Pkg. Kester rosin core solder
- Miscellaneous screws, nuts, lugs and wire.

he two vernier tuning controls, the volume-adjustment knob, an antenna-adjustment switch, and the small control switch which serves to turn on and off all power.

is truly sharp. The Shielded Six will not only separate local stations in such cities as New York and Chicago, but if at all favorably located, it will bring in distant out-of-town stations while local stations are on, and with an aerial only twenty to fifty feet in length. Ordinarily, it will deliver more volume than is necessary on practically all stations heard.

ration, this low hum is less than that ordinarily heard with average "B" socket-power units, and is never loud enough to interfere with reception, even with volume turned well down.

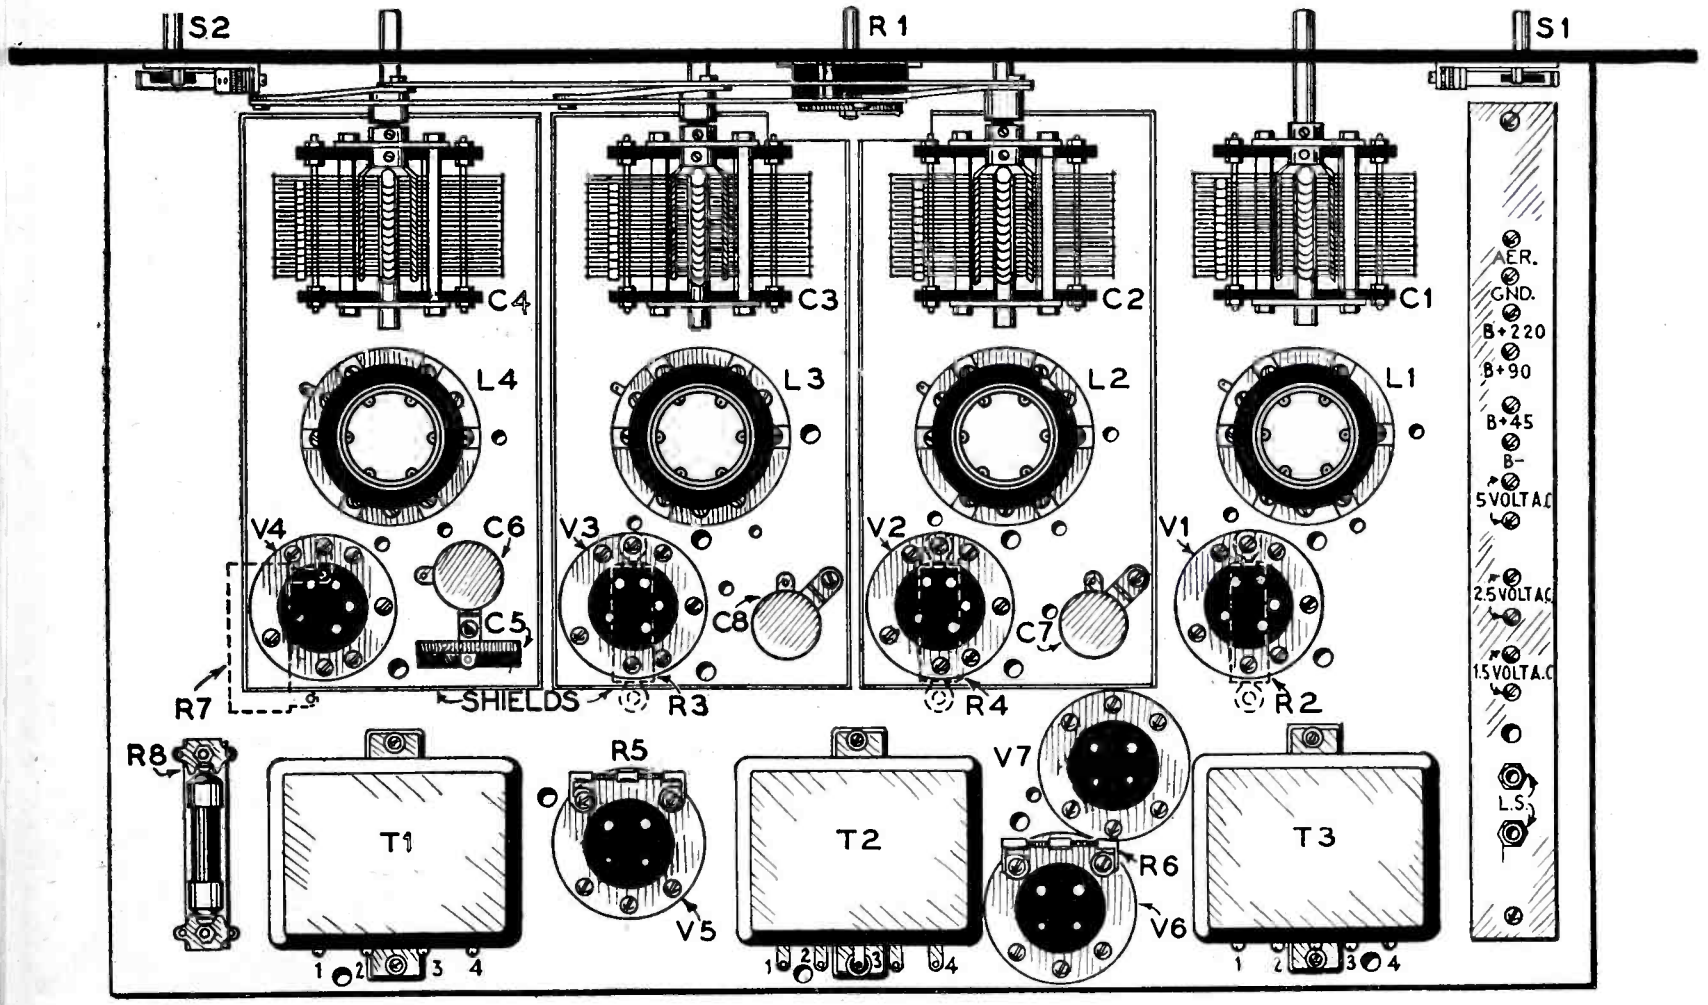


A photographic illustration showing how the power unit is connected to the A. C. Operated Shielded-Six.

Quality of Output

The performance of the receiver is a revelation in tone quality, for the Shielded Six provides a fidelity of reproduction which has pleased thousands

One of the features of the whole design is that the "A-B-C" power unit may be placed in the same cabinet with the set, only a foot or so away from the left end of the receiver.



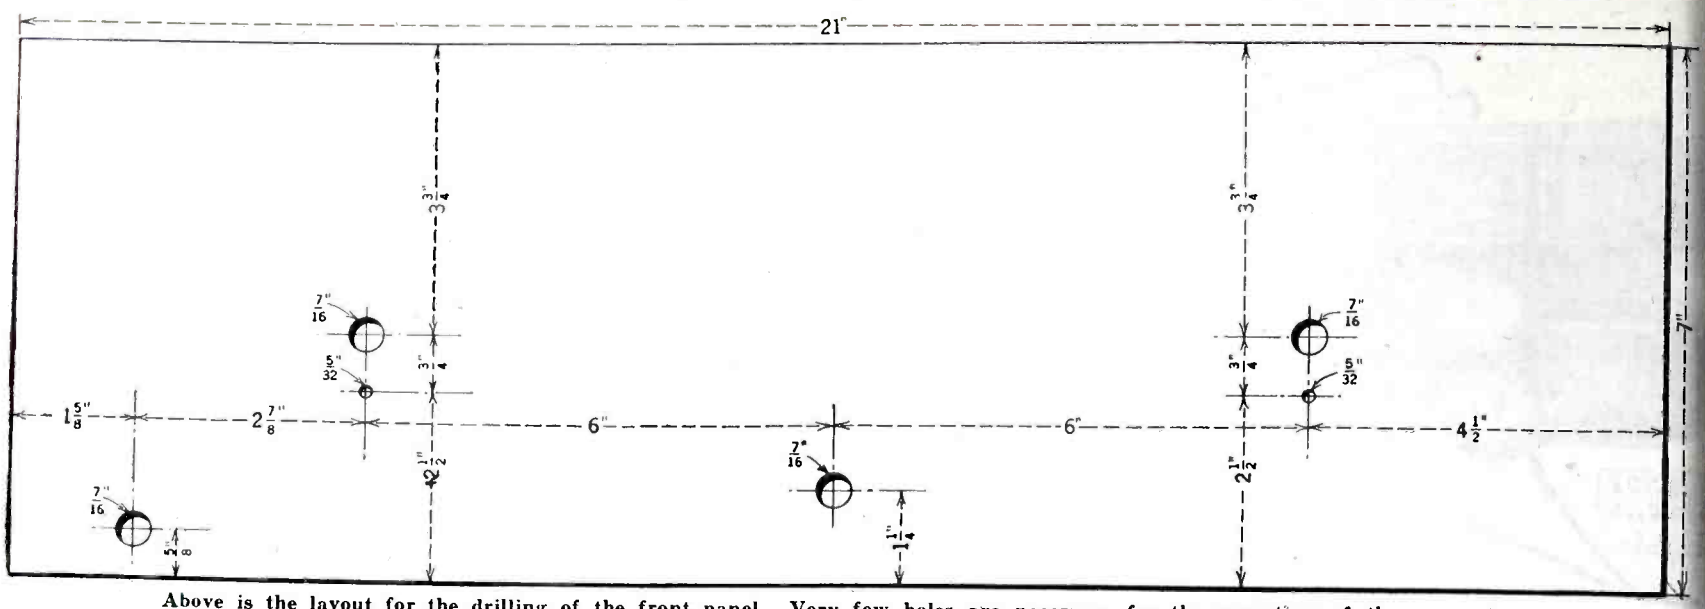
Instrument layout of the receiver showing the location of all parts. Resistances R2, R3, R4 and R7 are mounted beneath the sub-panel as indicated in dotted lines. The two switches, S1 and S2, are also mounted on the front panel underneath the sub-panel, though they are not shown in dotted lines in the above illustration.

of builders with its reality and life-likeness. Its operation is simplicity itself, for there are only two tuning controls to adjust, with a small auxiliary knob to regulate volume and sensitivity. The tuning is not critical, but

The use of the new A.C. tubes has been so carefully worked out that only a very low whisper of A.C. hum is heard in the loud speaker—so low that the head must be placed very close to the speaker to detect it at all. In ope-

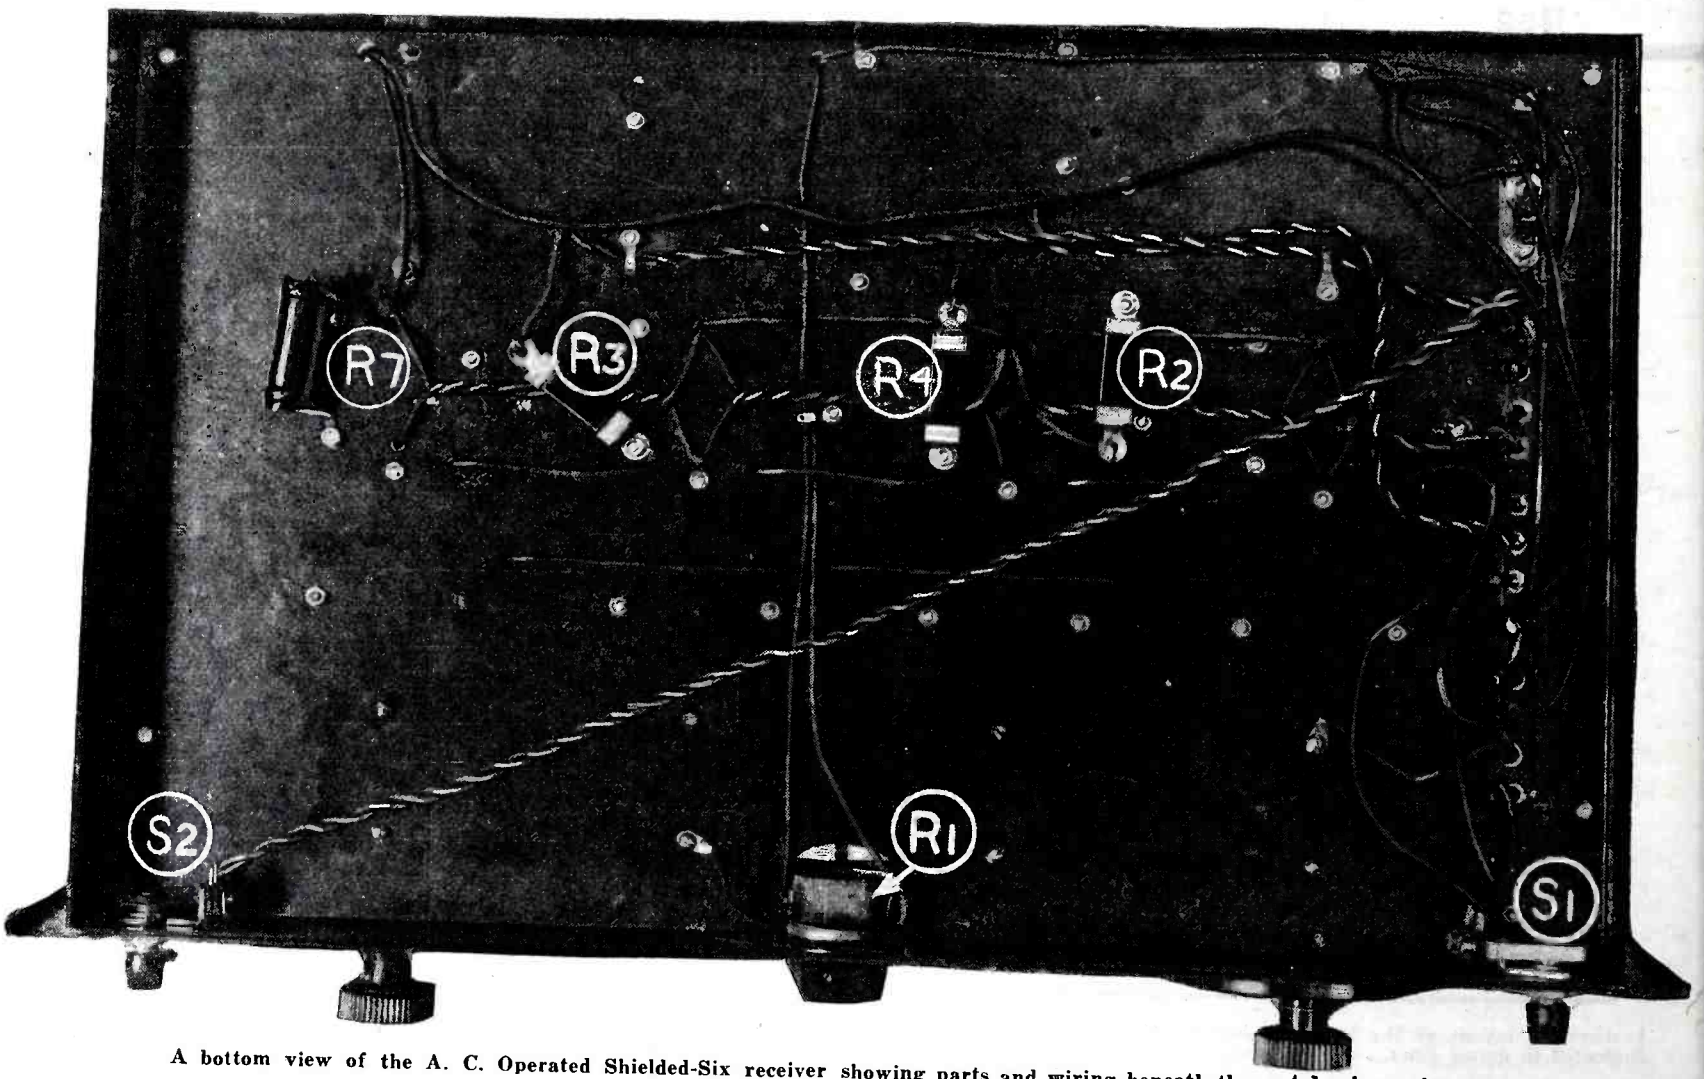
This simplicity attained through complete light-socket operation is the direct result of the development of the new A.C. tubes recently announced by tube manufacturers. However, the A.C. tubes in themselves are not suffi-

cient to replace batteries, chargers, and the accessory equipment forming an essential part of every radio installation up to now. In order to use these new A.C. tubes circuit designs must be very carefully evolved and worked up around them; for they cannot be put into any receiver without modification and expected to operate satisfactorily. It is probable that many fans will endeavor to do exactly this, and to convert their older receivers to complete light-socket operation, by employing A.C. tubes of special types and power units, which are certain to be advertised in tremendous quantities in the first few months by the get-rich-quick fraternity. With the full realization that such a course is certain to lead to trouble and grief, the entire design of the Improved Shielded Six receiver has been developed around the new A.C. tubes; so that, between the two models available (one for battery or socket-power unit operation and standard tubes, and one for light-socket operation) there are marked differences in circuit design. The points of difference have to do only with the different operating powers required for the new tubes; and, in actual performance, a Shielded Six, whether built for battery operation or for light-socket operation with A.C. tubes, will operate in exactly the same fashion so far as actual results are concerned.

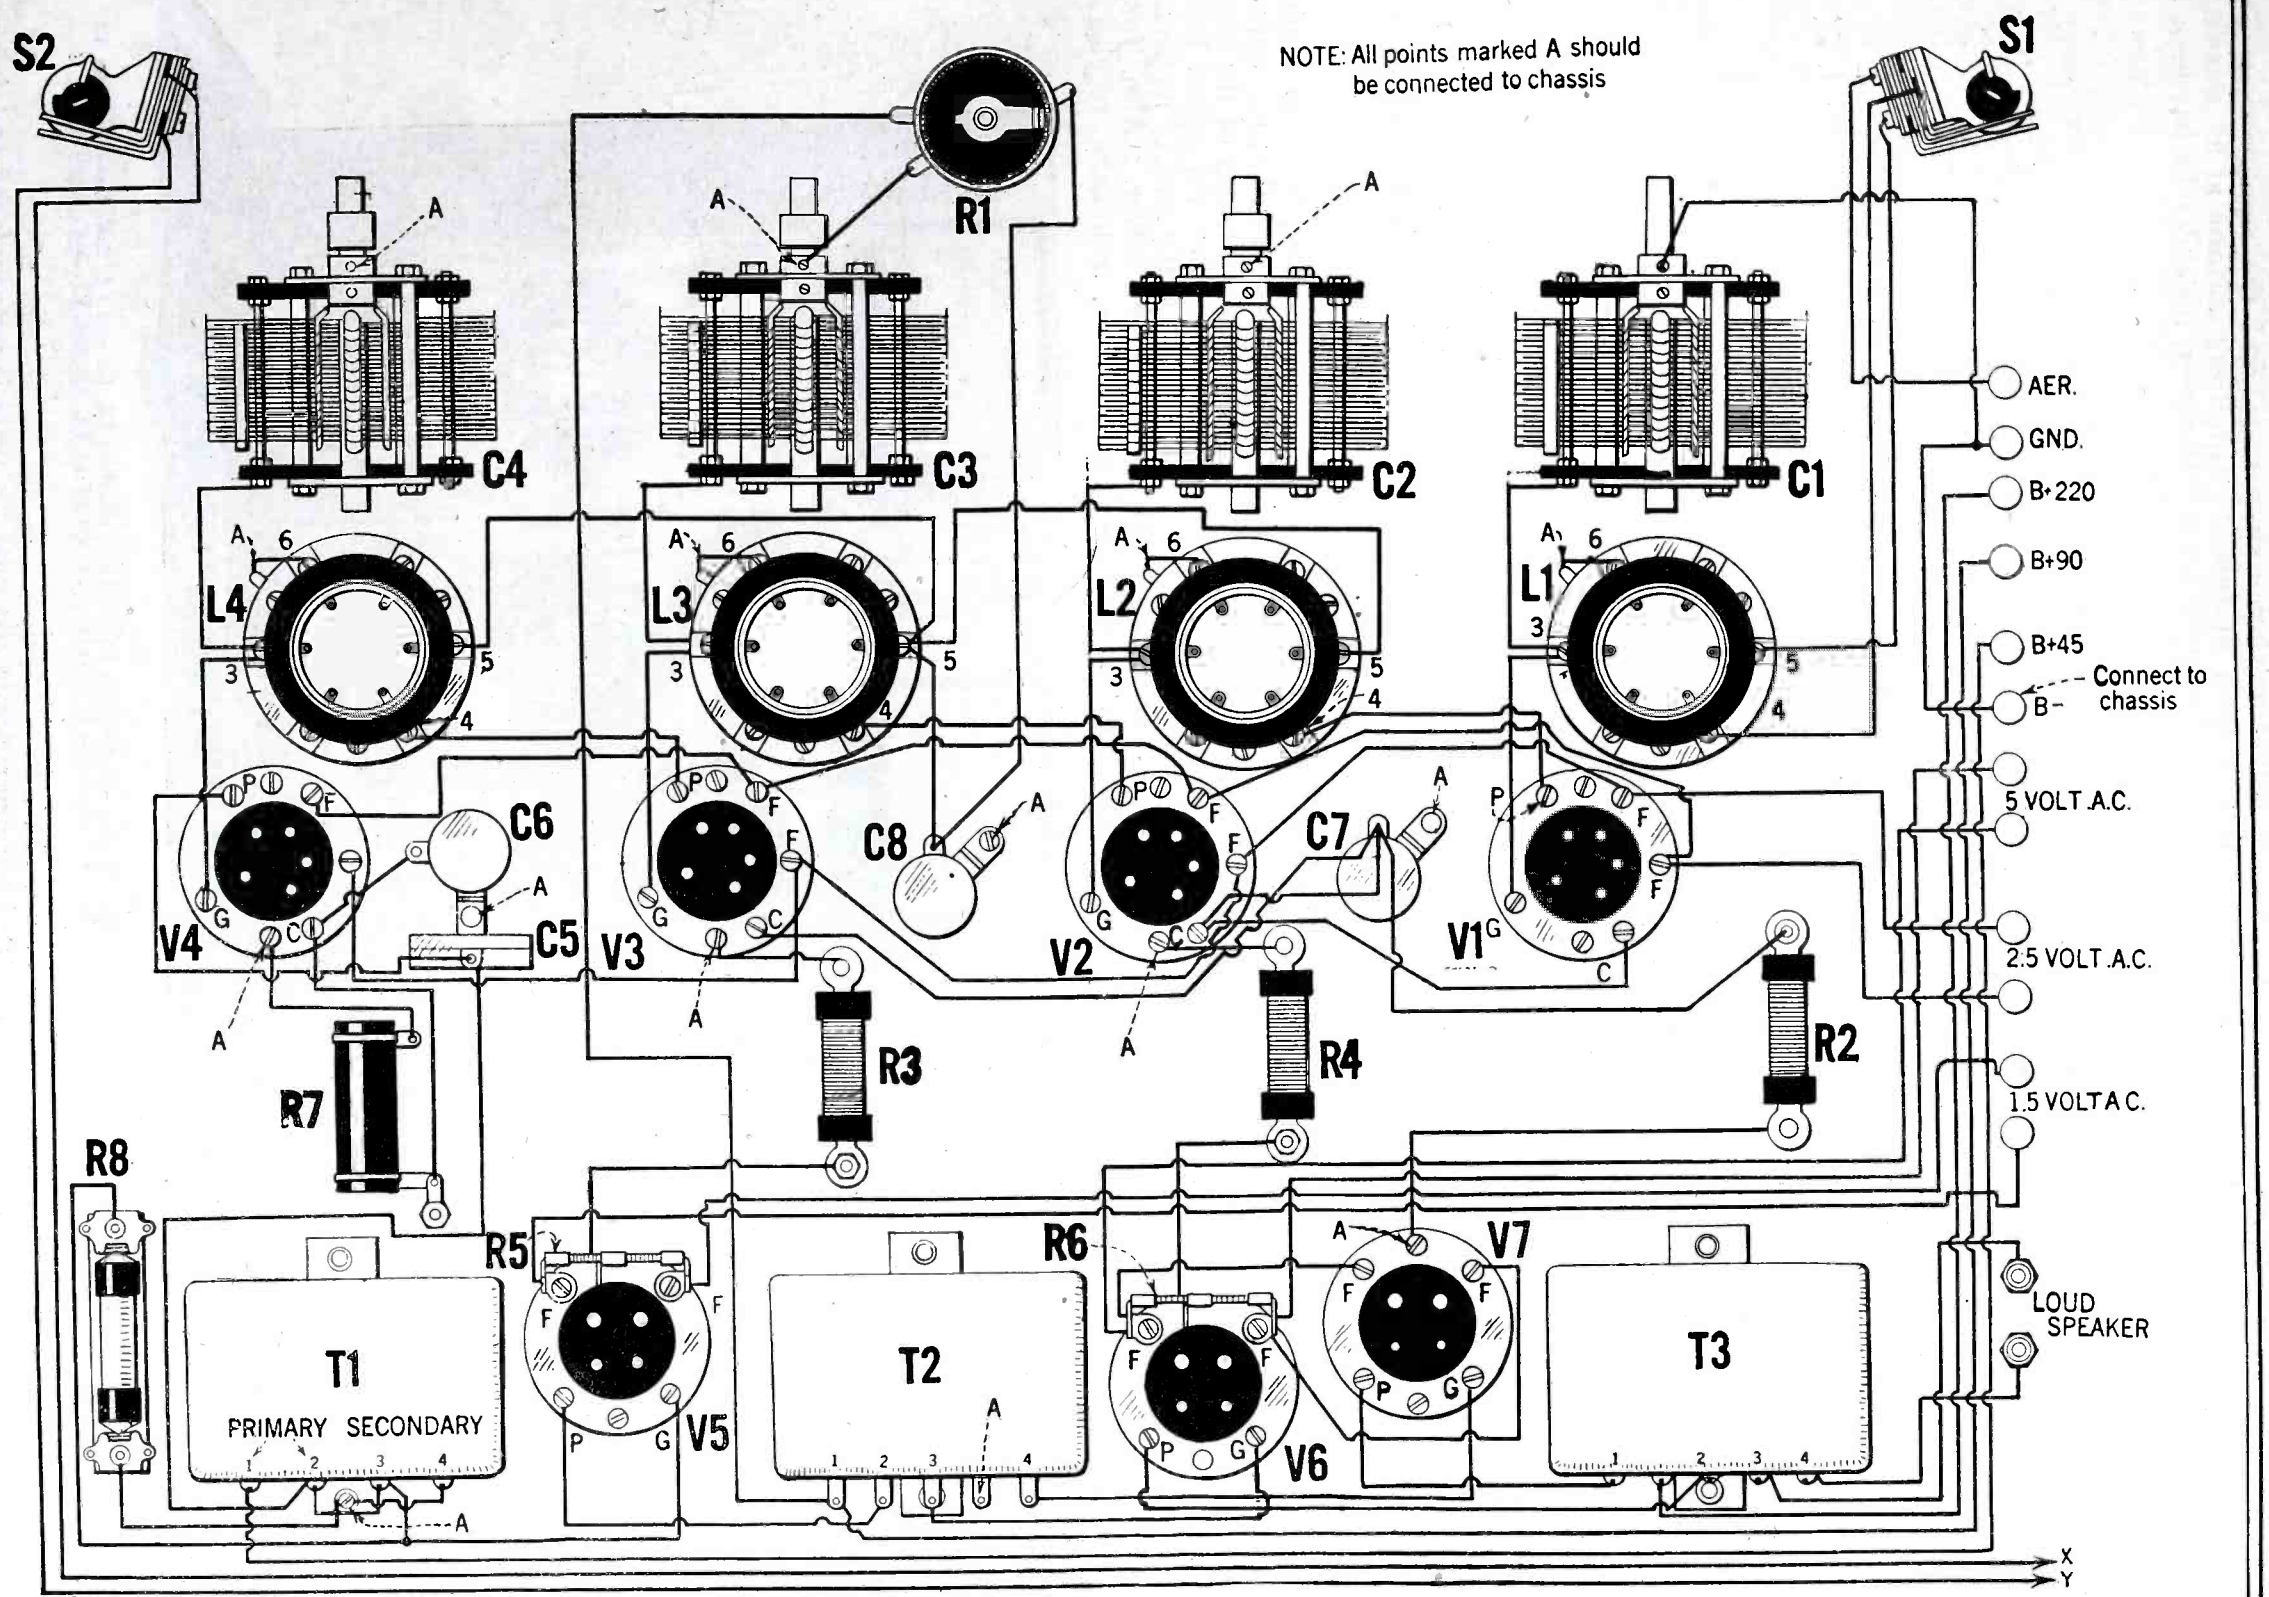


Above is the layout for the drilling of the front panel. Very few holes are necessary for the mounting of the apparatus.

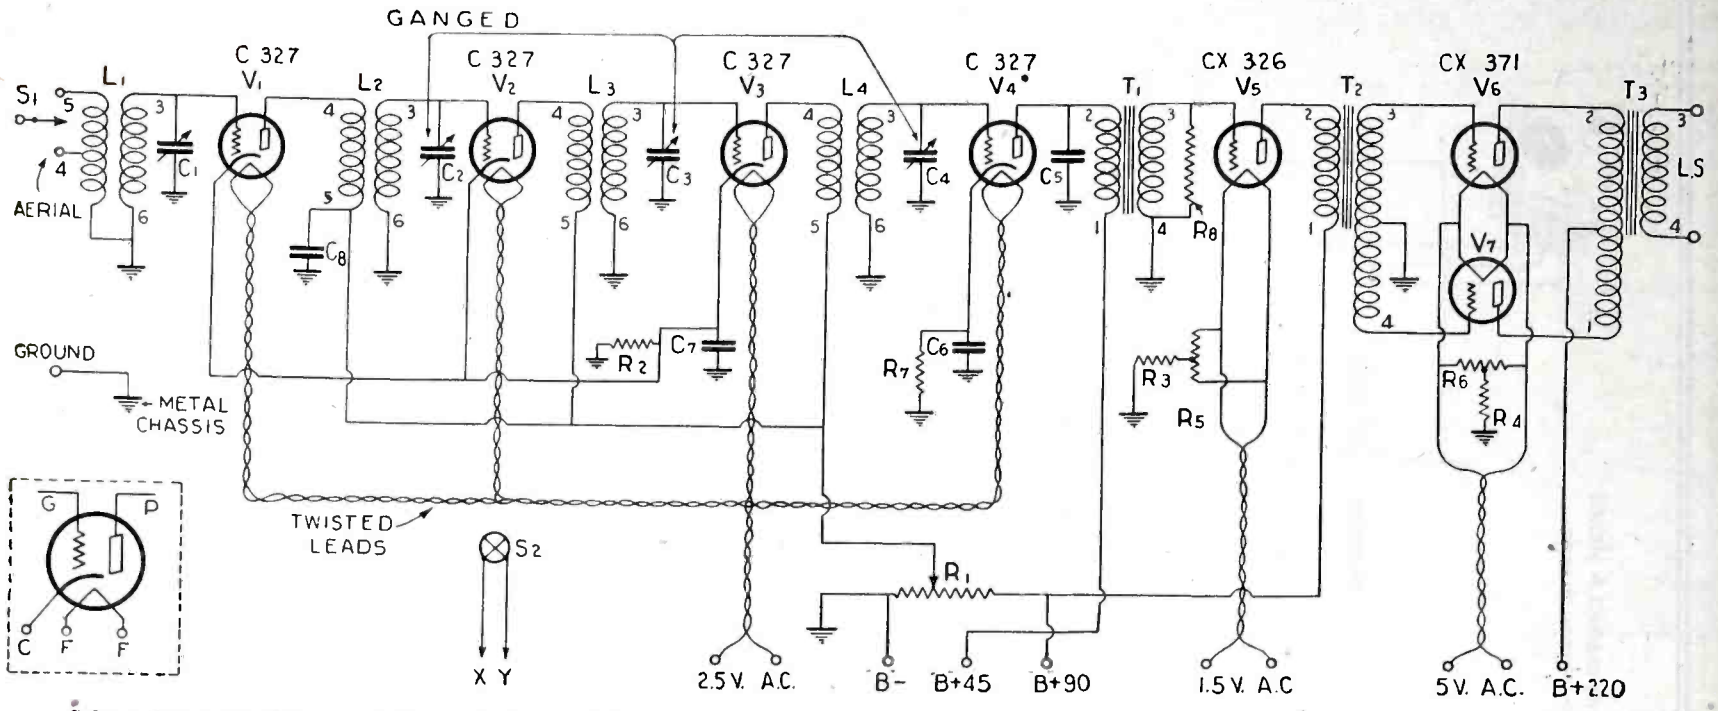
Electrically, the A. C. - operated Shielded Six comprises three low-resistance, low-loss tuned-R.F. amplifier stages and a detector; each containing a space-wound radio-frequency transformer, the primary and secondary windings of which are held on a molded bakelite form in such fashion that they are practically air-supported. The grid circuits of all four transformers are identical, as are the characteristics of the four modified-S.L.F. tuning condensers employed with them. As a result, the tuning adjustments of the second, third, and detector stages being identical, all are operated by a single-control dial simultaneously adjusting the three condensers through the agency of a mechanical link which is free from back-lash. Since antenna characteristics cannot be definitely pre-



A bottom view of the A. C. Operated Shielded-Six receiver showing parts and wiring beneath the metal sub-panel chassis.



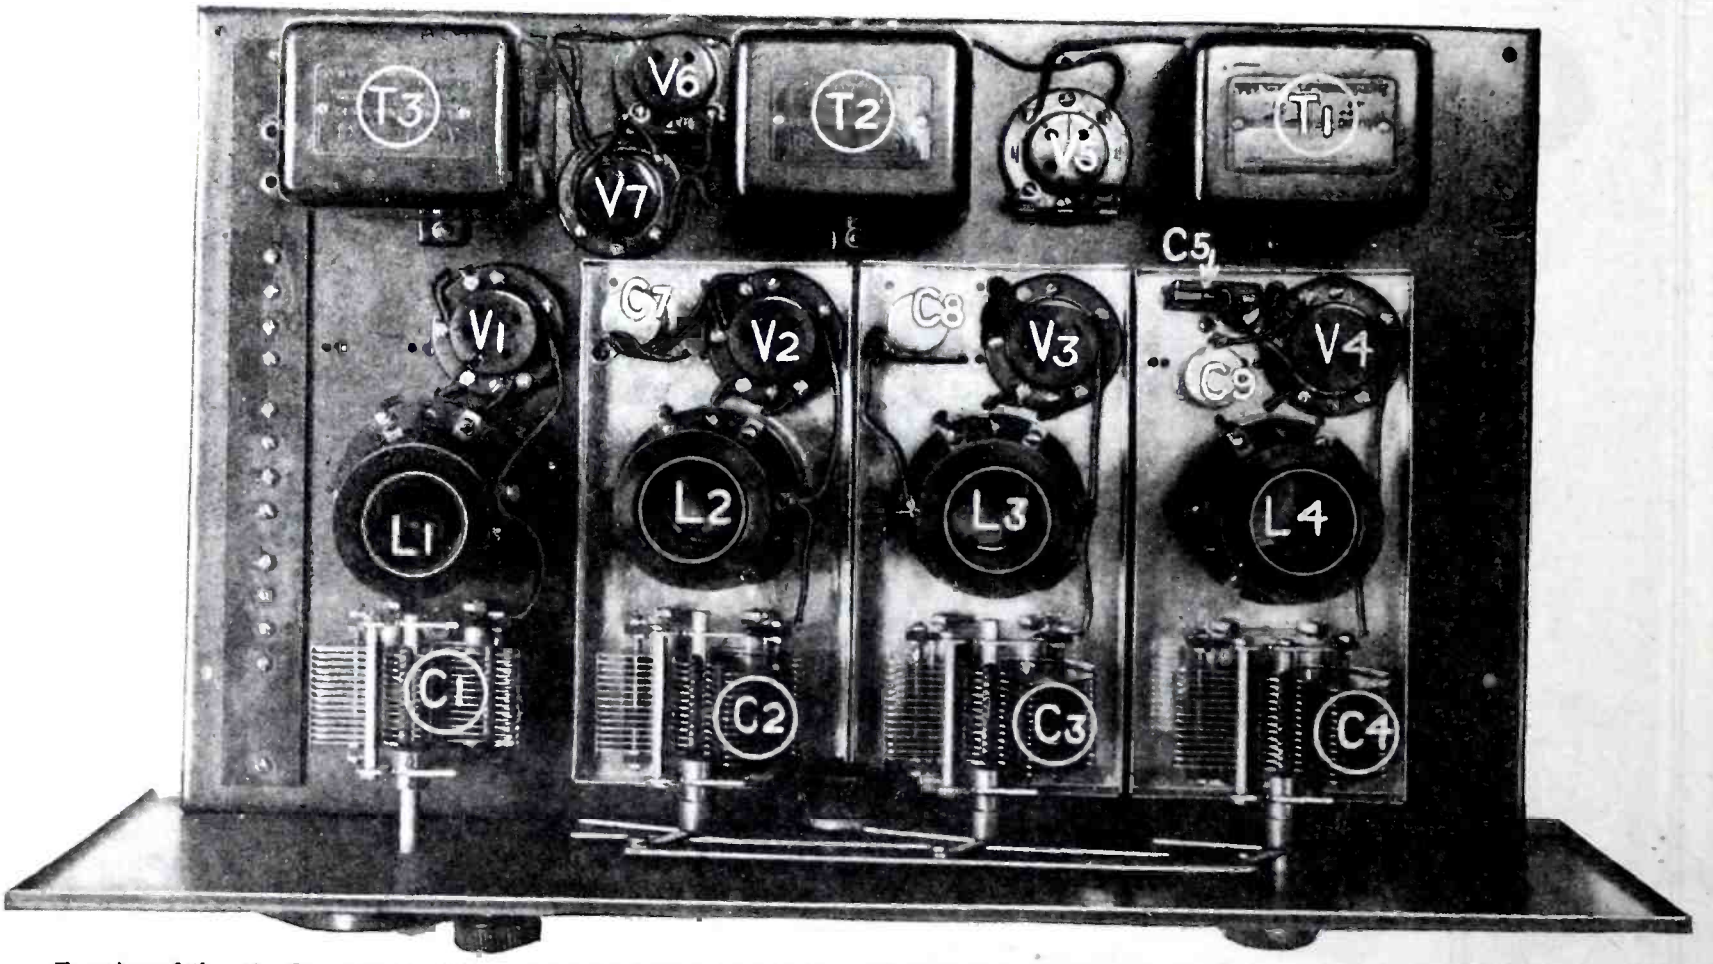
determined and will vary with every installation, the antenna stage of the Six is tuned by a separate control; and primary spacing is that maximum energy-transfer results from maximum coupling, and maximum coupling for a stage, and the amplification is comparatively uniform at all wavelengths. However, no endeavor has been made



Schematic wiring diagram of the A. C. Operated Shielded Six Receiver. The diagram of the socket-power unit is on page 100. In the left corner the cathode or electron emitter is marked C.

in order to accommodate varying lengths of aerials, a tap-switch is provided, allowing the use of part or whole of the antenna transformer's primary coil.

The design of the three R.F. transformers is very interesting, in that the primaries are spaced out under a large portion of the secondary windings instead of being bunched in a small slot at the filament end of the secondary, as recently advocated. The reason for given value of primary inductance is obtained through spacing the primary beneath the secondary. Were the primary bunched to obtain the same value of R.F. amplification, many more primary turns would have to be used and the oscillation tendency, due to the tuning effect of the primaries in the tube plate circuits of the receiver, would be greatly increased. The R.F. amplification factor of the receiver is quite high, averaging better than 10 to 12 per to obtain absolutely uniform amplification at all wavelengths; as, were this done, the high efficiency of the receiver at certain wavelengths would have to be cut down to the level of its performance at other waves. Also, for the same reason, automatic regeneration control is not employed and, instead, a small manual sensitivity adjustment allows the receiver to be operated at optimum efficiency at every wavelength.



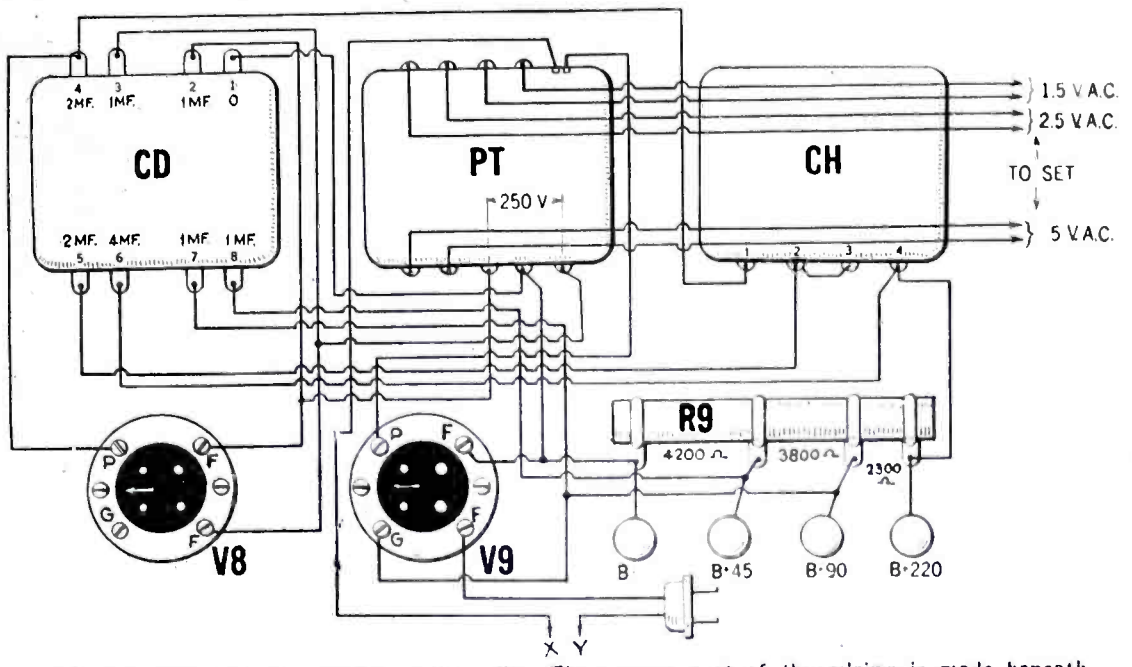
Top view of the set. C1, antenna condenser; C2, C3 and C4, R.F. tuning condensers; L1, antenna coupler; L2, L3 and L4, R.F. transformers; T1 and T2, A.F. transformers; T3, output transformer; V1, V2 and V3, R.F. tubes; V4, detector; V5, V6 and V7, A.F. amplifiers.

The first R.F. stage is unshielded;

there being little point in shielding it to prevent a coil-socket pick-up which would be far lower than the degree of energy intentionally fed to this first coil from the antenna. The problem with the three other tuned circuits is entirely different; and each is individually shielded in an aluminum housing, to prevent interaction between stages and pick-up of external interference, which has not passed through the filtering process imposed by the preceding stages. The wavelength range of the receiver with a set of standard coils is 200 to 550 meters; while by means of two additional sets, of four coils each, it may be extended up to 3,000 meters, thus rendering it adaptable to all classes of broadcast reception throughout the world.

Audio Amplification

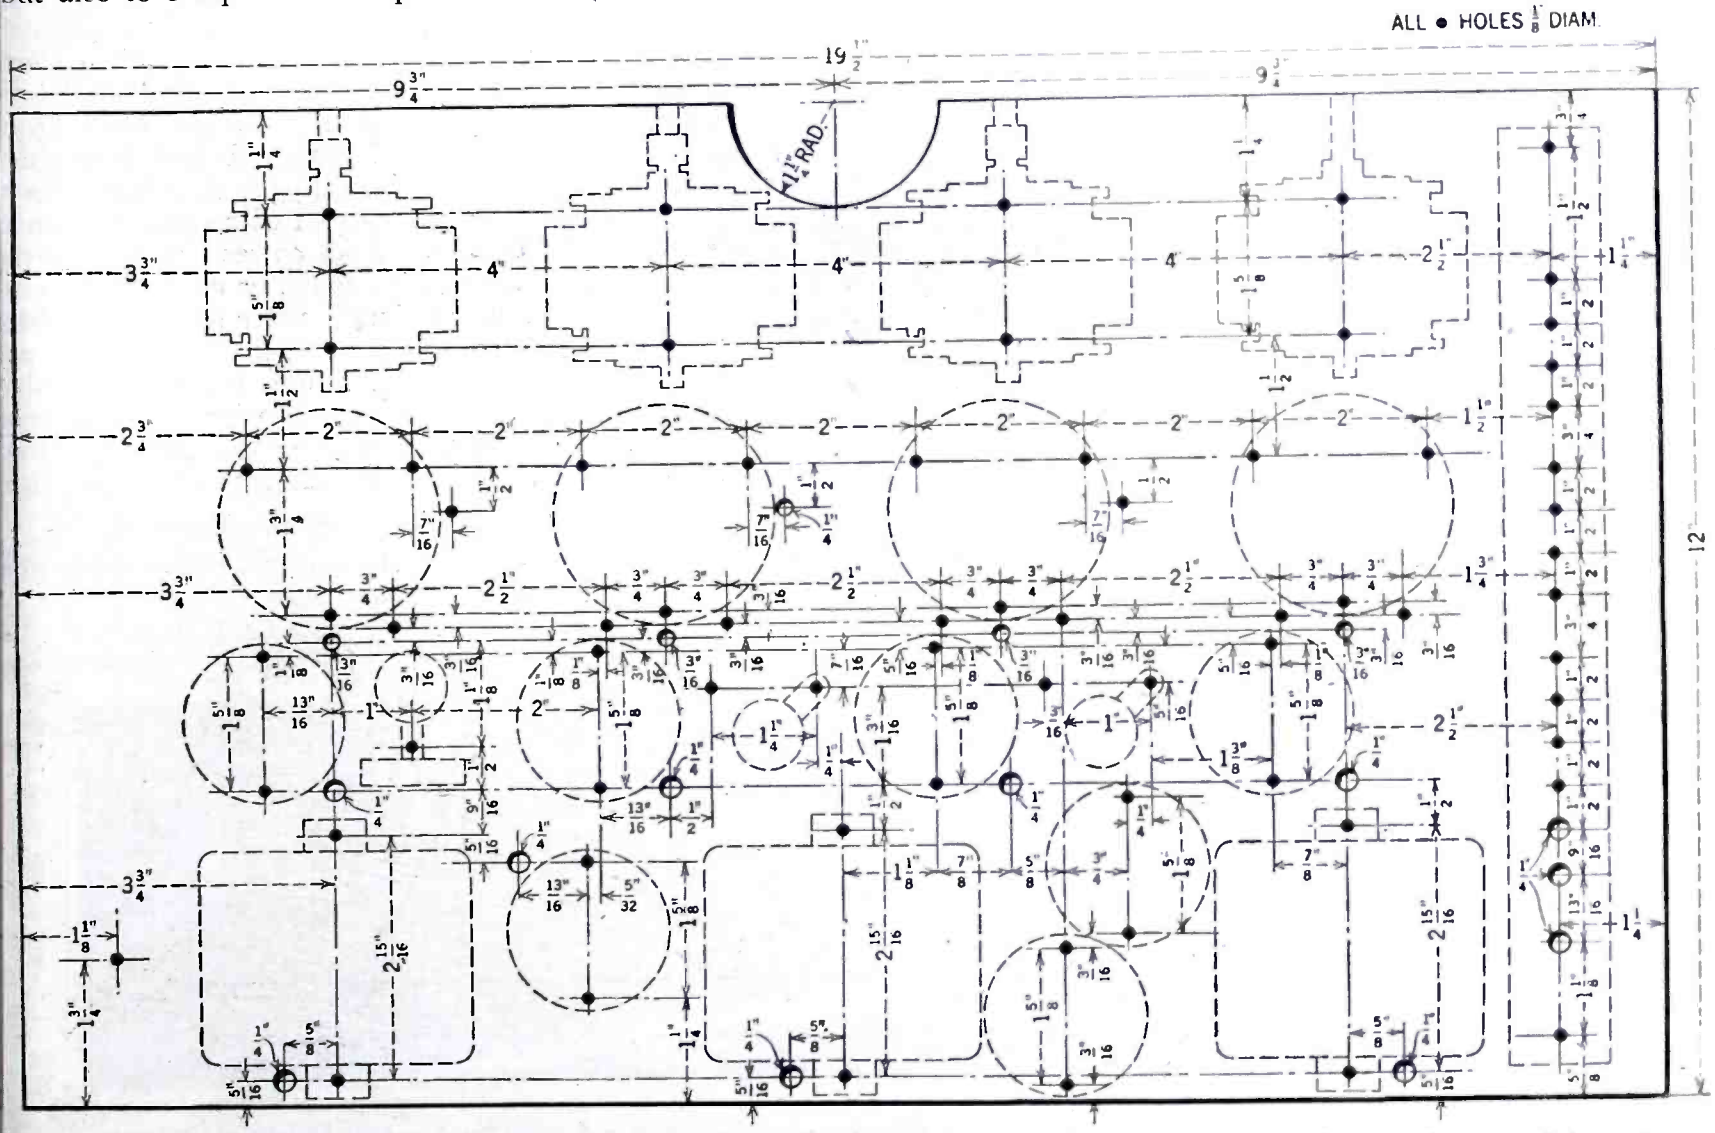
The audio-frequency amplifier consists of two stages employing large, heavy transformers which provide excellent low-note reproduction with a 5,000-cycle cut-off; resulting in the elimination to a great extent of background noise, heterodyne squeals, and interference. An output transformer is employed, not only to protect the loud-speaker windings from the high plate current of the last power tube, but also to compensate for poor loudspeaker performance at low frequencies. It is a well-known fact that the average loud speaker is far less efficient at very low frequencies than it is through the middle register. It is just this deficiency that the special output transformer compensates.



Picture wiring diagram of the power unit. The greater part of the wiring is made beneath the metal sub-panel. Resistance R9 is mounted on the underside of the sub-panel.

The A.C. Tubes

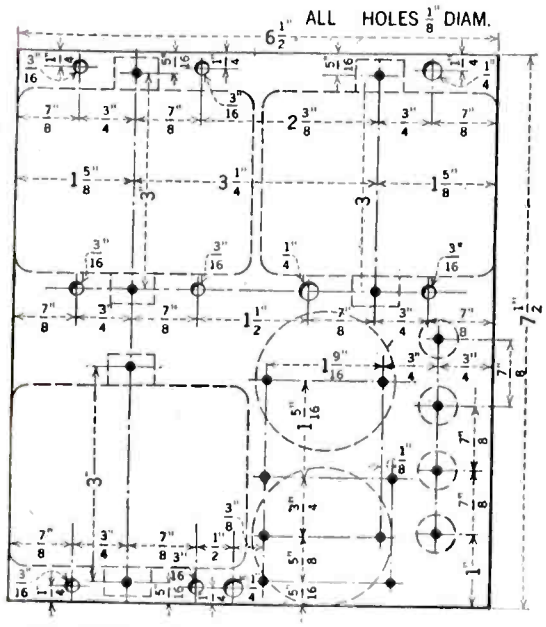
Four CY-327 (heater-type) tubes are employed in the three R.F. stages and as a detector. These tubes are used because the standard CX-326 (raw-A.C.) amplifying tubes are unsuited for use in an extremely sensitive radio-frequency amplifier; though the latter are well adapted to many of the comparatively insensitive "loss-controlled" T.R.F. sets, which are sold in large quantities at prices of from forty to sixty or seventy dollars. However, in an extremely sensitive amplifier with a manual sensitivity control capable of obtaining maximum performance from the R.F. amplifier, the raw-A.C. tubes introduce too high a value of hum; and therefore they do not lend themselves to such amplifiers. On the other hand, the five-prong CY-327 "heater" tubes, with isolated filaments heating an electron-emitter (cathode), are admirably



The drilling layout for the sub-panel. The different instruments are shown in dotted outline. All dimensions for mounting screw-holes and wire-holes are included.

suited to ultra-sensitive R.F. amplifiers and hence are employed in the Shielded Six.

The first audio amplifier is a CX-326 raw A.C. tube, which is entirely



The drilling layout for the sub-panel of the socket-power unit.

suited for first-stage audio work. The second audio stage consists of two CX-371 power tubes in a push-pull amplifier circuit capable of delivering considerably more undistorted power output than will the average 310 power pack employing only one amplifier tube. The CX-371s are not strictly A.C.-type tubes, but are entirely suited for last-stage audio work with direct A.C. excitation of the filaments. The push-pull feature is optional, and the receiver as available in kit form is provided with a straight 371 power output stage, which delivers ample volume for the majority of homes. The set illustrated herewith uses the push-pull arrangement.

Socket-Power Unit

Power for the receiver is obtained through a power-supply device, which is essentially a very carefully designed "B" socket-power unit incorporating automatic voltage regulation by a glow tube and a special selective filter circuit for extreme freedom from hum, required in such a set as the Shielded Six. This power unit consists of a step-up transformer carrying two 250-volt windings, and an 85-milliampere full-wave gaseous rectifying tube. The output of this tube is filtered through a single double-section choke coil and a special combination of condensers providing a selective circuit resonant at 120 cycles—the fundamental ripple of the rectified output. The filter delivers to the voltage dividing resistor a total of 220 volts at approximately 82 milliamperes. Of this, a portion is drawn by the glow tube, to be given up to the receiver under the instantaneous demand imposed by strong signals; the remainder goes directly to the plates of the power output tube.

Filament excitation is obtained from three separate filament-lighting windings carried by the power transformer. One winding of 2.5 volts lights the four CX-327 heater tubes; another winding of 1.5 volts lights the CX-326 first audio-stage amplifier; and the third winding of 5 volts lights the CX-371 power output tubes. "C" potential

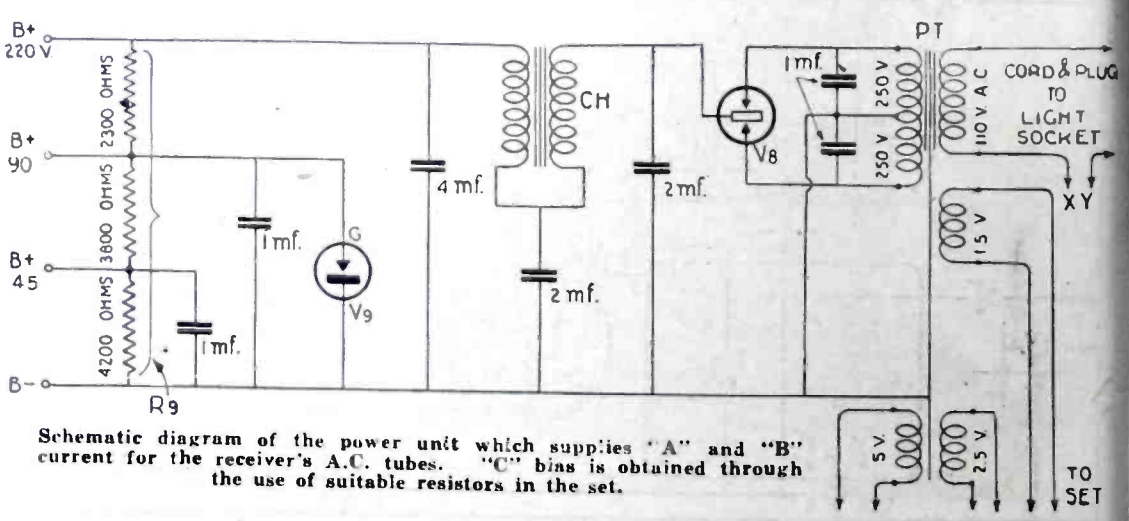
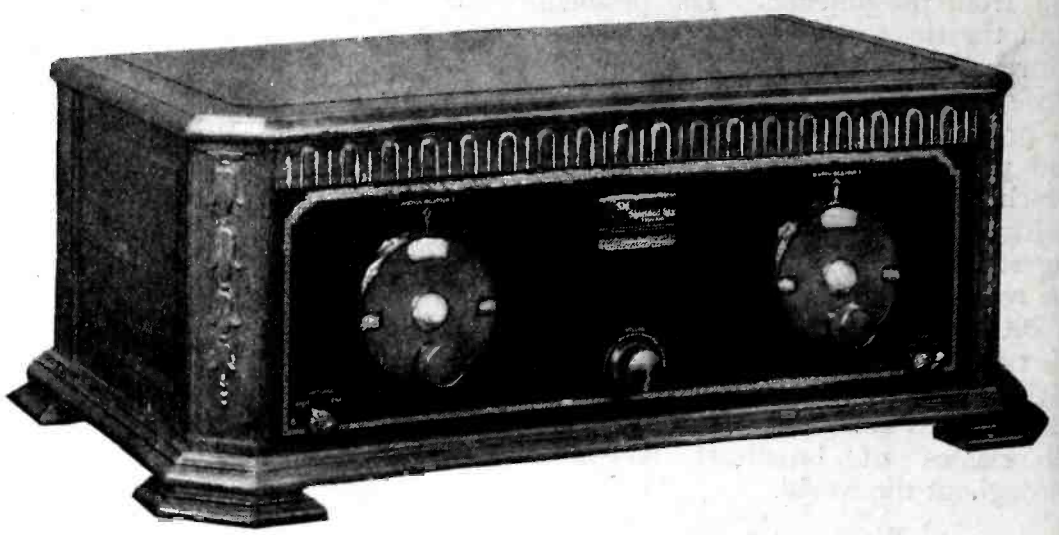
for the various circuits is obtained by means of four resistors inserted in the common grid and plate returns; the voltage drop developed in operation



Schematic diagram of the power unit which supplies "A" and "B" current for the receiver's A.C. tubes. "C" bias is obtained through the use of suitable resistors in the set.

serves to bias the various tube grids to the proper value. The by-passing of these resistors and other portions of the circuits has been very carefully considered and worked out; and, in constructing the receiver, it is vitally important that specifications be adhered to exactly, in order that the maximum results from the circuit design be realized.



The A.C. Operated Shielded Six receiver, mounted in a table-type cabinet. The left dial controls the variable condenser which tunes the antenna circuit. The right-hand dial operates the link motion that turns the three remaining condensers simultaneously. The switch S1 is at the left and S2 at the right is the "Off-On" switch.

In operation, the power unit is connected to the receiver terminal strip by means of three twisted pairs of wires for the three A.C. filament circuits, and four high-voltage connecting leads. Thus a total of ten wires to the power unit and receiver are all that are necessary, plus a short length of twisted lamp cord, which is run from the "on-off" switch to one side of the 110-volt cord of the power-supply unit. These leads may be cabled and the power unit placed either a few inches away from the left end of the receiver, with short leads, or beneath the set on the floor, or on the bottom of a console cabinet. The leads from power unit to receiver should, preferably, be not over three to four feet long. Since there are no batteries to wear out, the receiver is practically free from servicing trouble other than the occasional replacement of a tube, at intervals varying from three to four months to a year or more.

Building the Receiver

The parts used in constructing the A.C.-operated Shielded Six are listed elsewhere in this article. The principal components listed and specified should be used with no thought of substitution; for unlike that of a battery-ope-

(*Continued on page* 174)

THE "HOT SPOT" FOURTEEN

By

A. M. Powers

IN many multi-tube receivers the use of more than the normal 5 or 6 tubes is not justified by the results obtained. After all, there is little to be gained by using eight, nine or ten tubes in a receiver if the results obtained from them are not superior to results obtained with receivers that use fewer tubes.

On the other hand, if the use of a few extra tubes does result in superior reception, then their use is fully justified, if one is aiming at maximum results.

In the case of the "Hot Spot" Fourteen receiver an unusually large number of tubes is used. But it is believed that this is justified by the results obtained because the receiver combines extreme selectivity with unusual sensitivity, good tone quality and easy operation.

The most unusual feature of the receiver lies in the intermediate-frequency amplifier. This amplifier employs eight stages each of which is sharply tuned to a comparatively high frequency—much higher than the ordinary super-heterodyne intermediate frequency. Each one of these stages provides somewhat less amplification than does a stage of ordinary intermediate amplification, but the total amplification obtained with the eight stages is far greater than other receivers provide with their fewer stages, albeit higher amplification per stage.

The higher the amplification per stage in a super-heterodyne receiver the greater the tendency toward instability, as a general rule. That is, a two stage amplifier having an amplification of let us say 10 per stage is liable to be more critical and unstable than a three stage amplifier with an amplification of 6 per stage. Yet this three stage amplifier would provide over twice the amplification of the two stage, high amplification unit. Thus a receiver

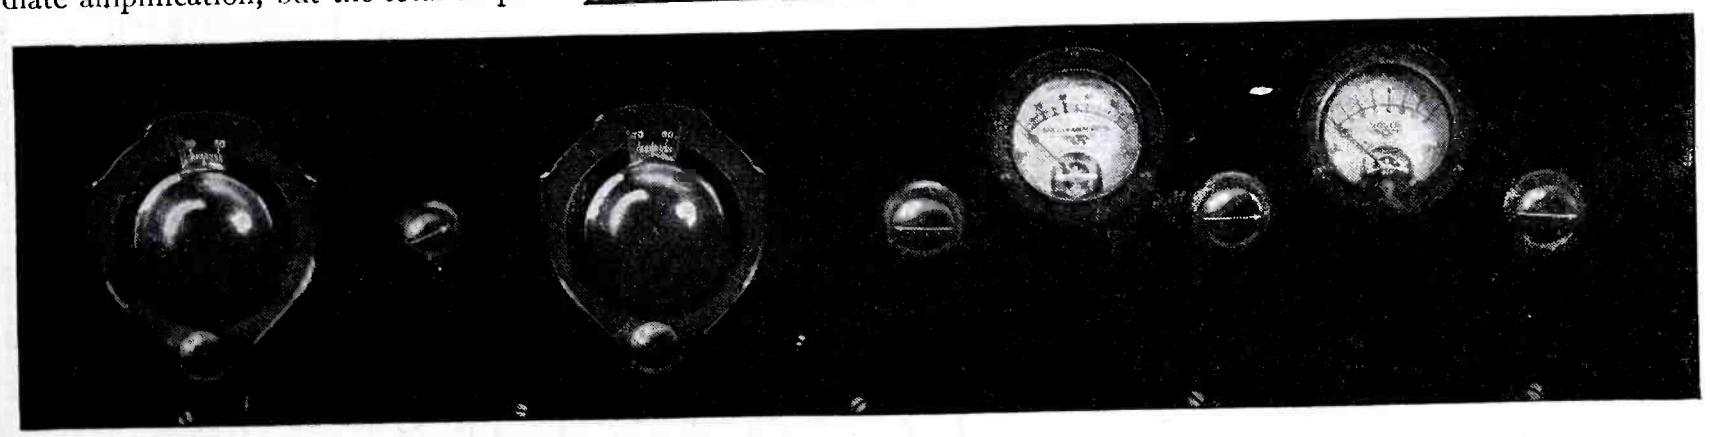
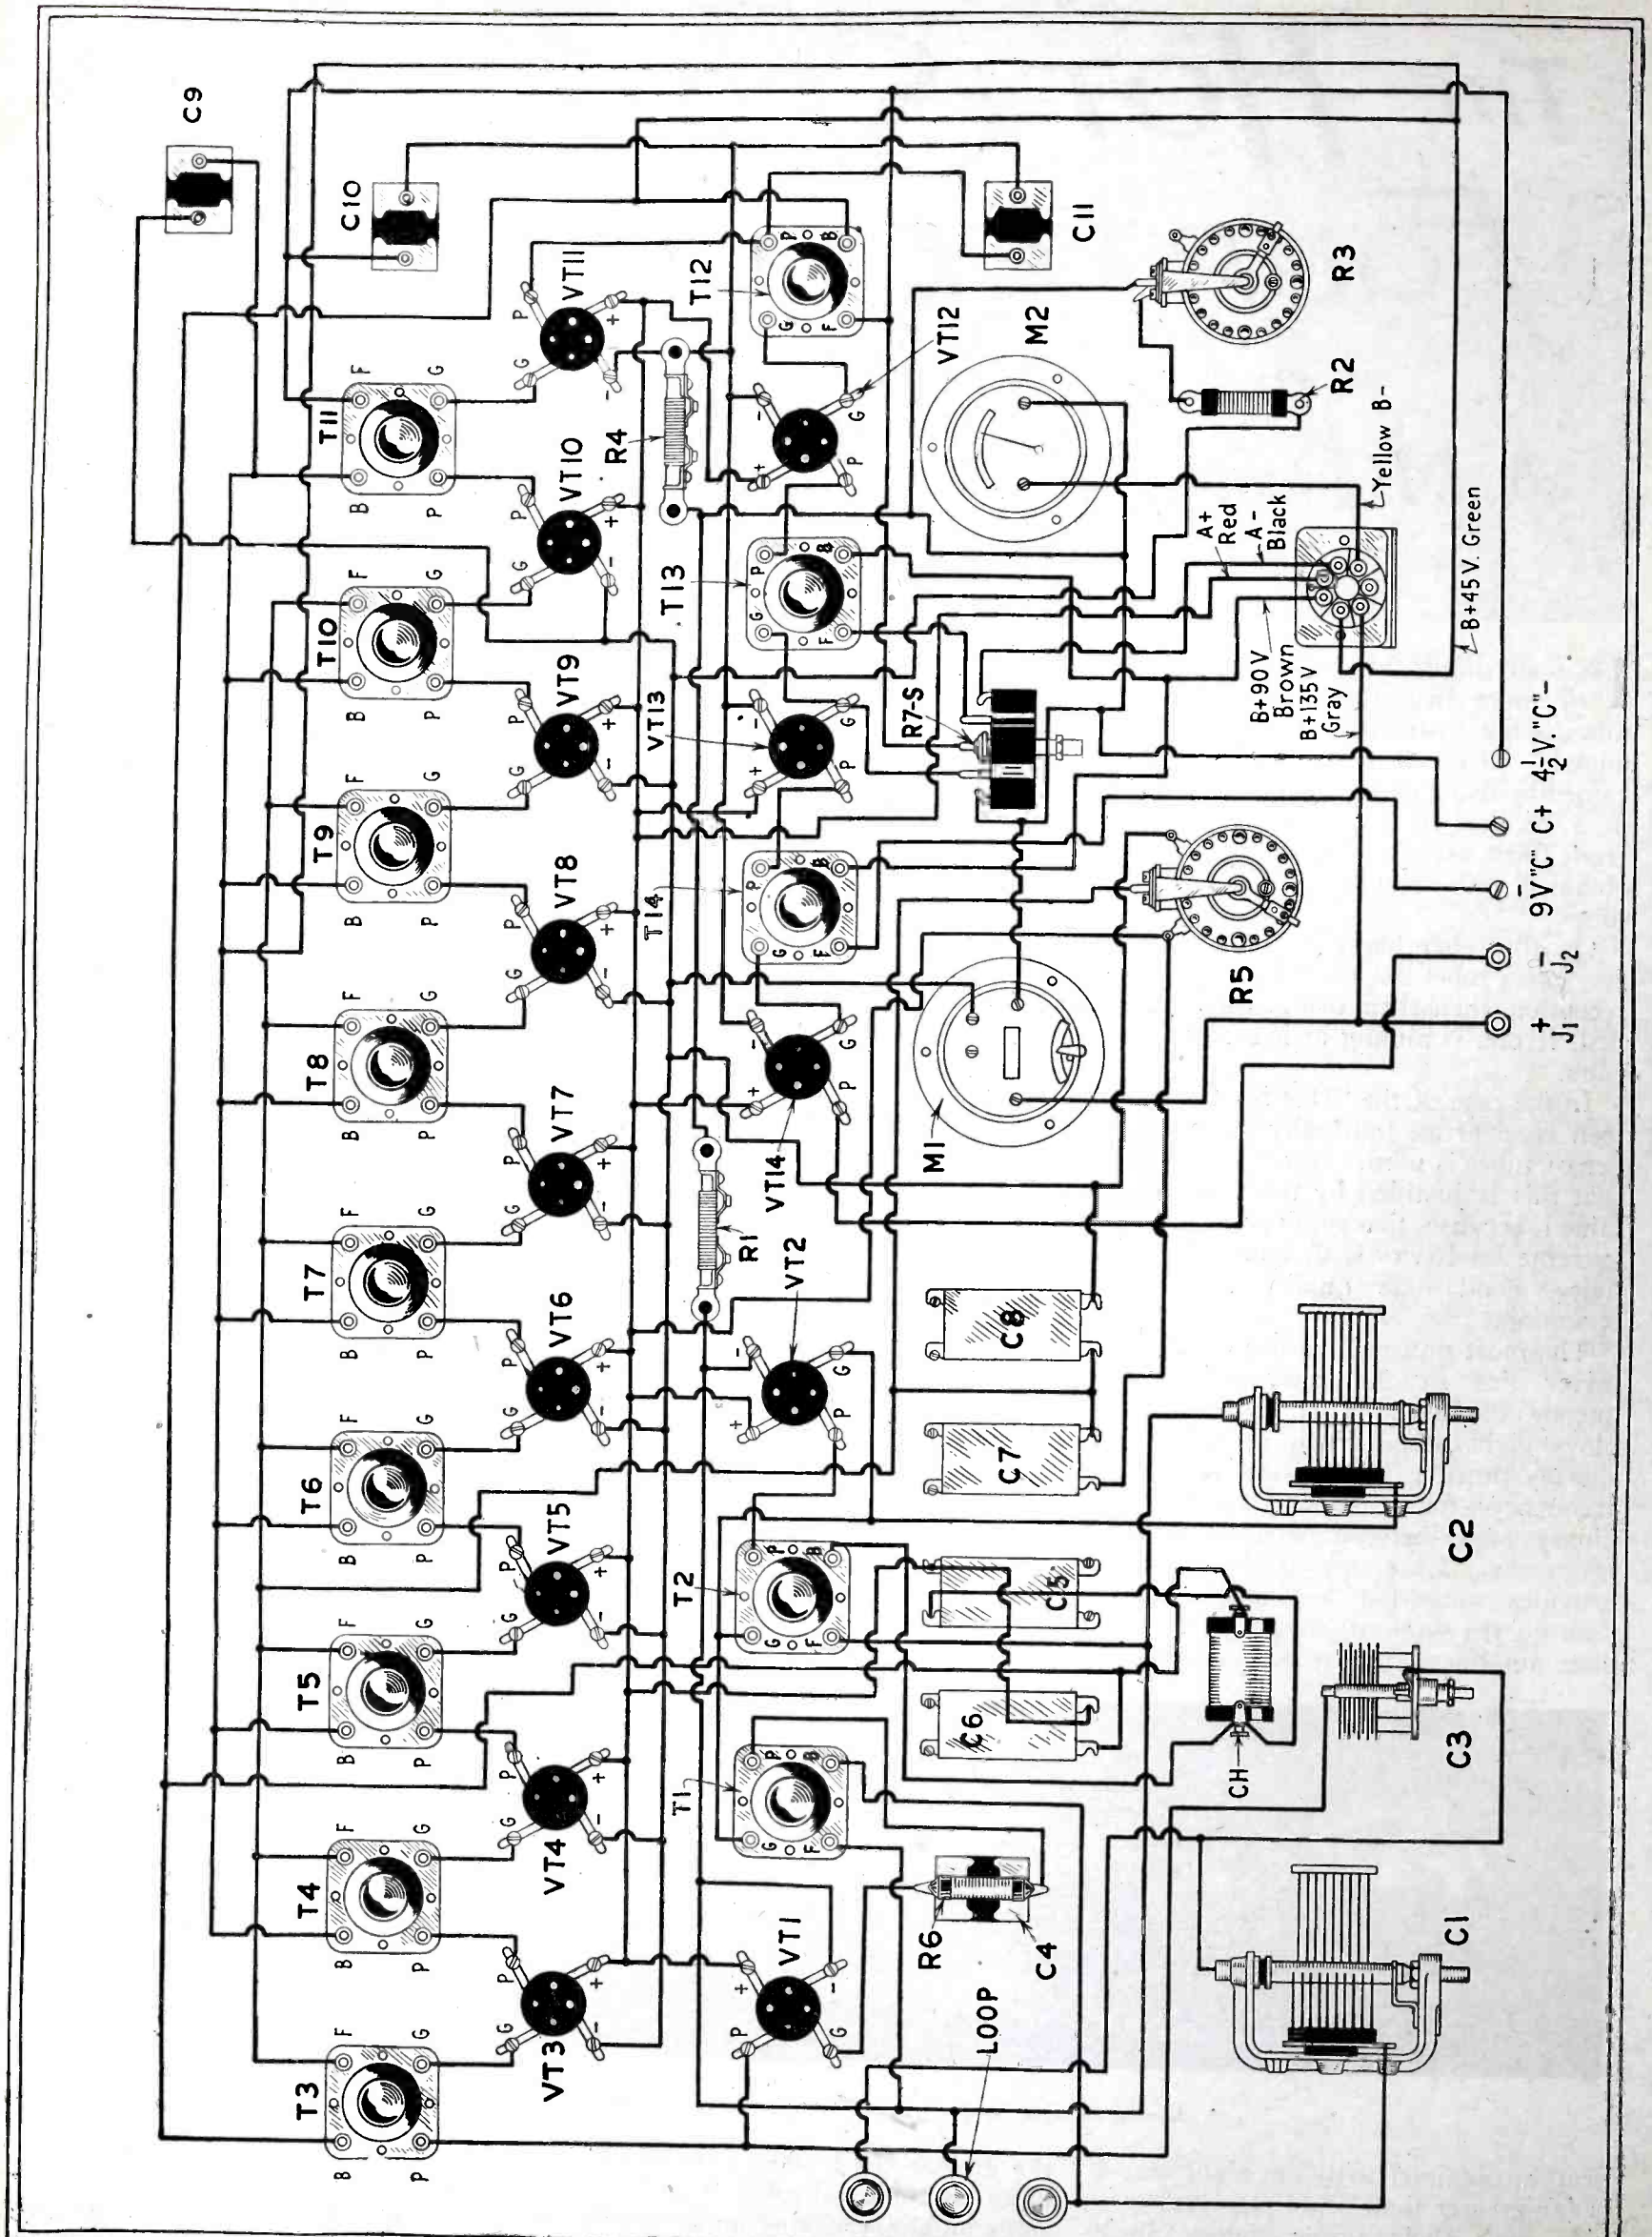
1 Lynch 4 megohm Metallized grid resistor, R6.
1 Frost 200,000 ohm potentiometer with filament switch, R7 (S).
1 Jewell double range 7½-150 volt voltmeter (M_1).
1 Jewell 0-100 milliammeter (M_2).
2 Kurz-Kasch vernier dials.
1 Formica front panel, 7" x 30" x $\frac{3}{16}$".
1 Formica sub-panel, 7" x 29" x $\frac{3}{16}$".
1 wood baseboard, 10" x 29" x ½".
6 X-L binding posts with marker tags as follows: Loop (3), C Battery+, C Battery — (2).
2 Yaxley Tip Jacks, J1, J2.
1 package Kester radio solder.
30 feet Acme Celatsite hook-up wire.
1 Bodine DeLuxe Loop.
1 Excello console cabinet
Miscellaneous screws, nuts, etc.



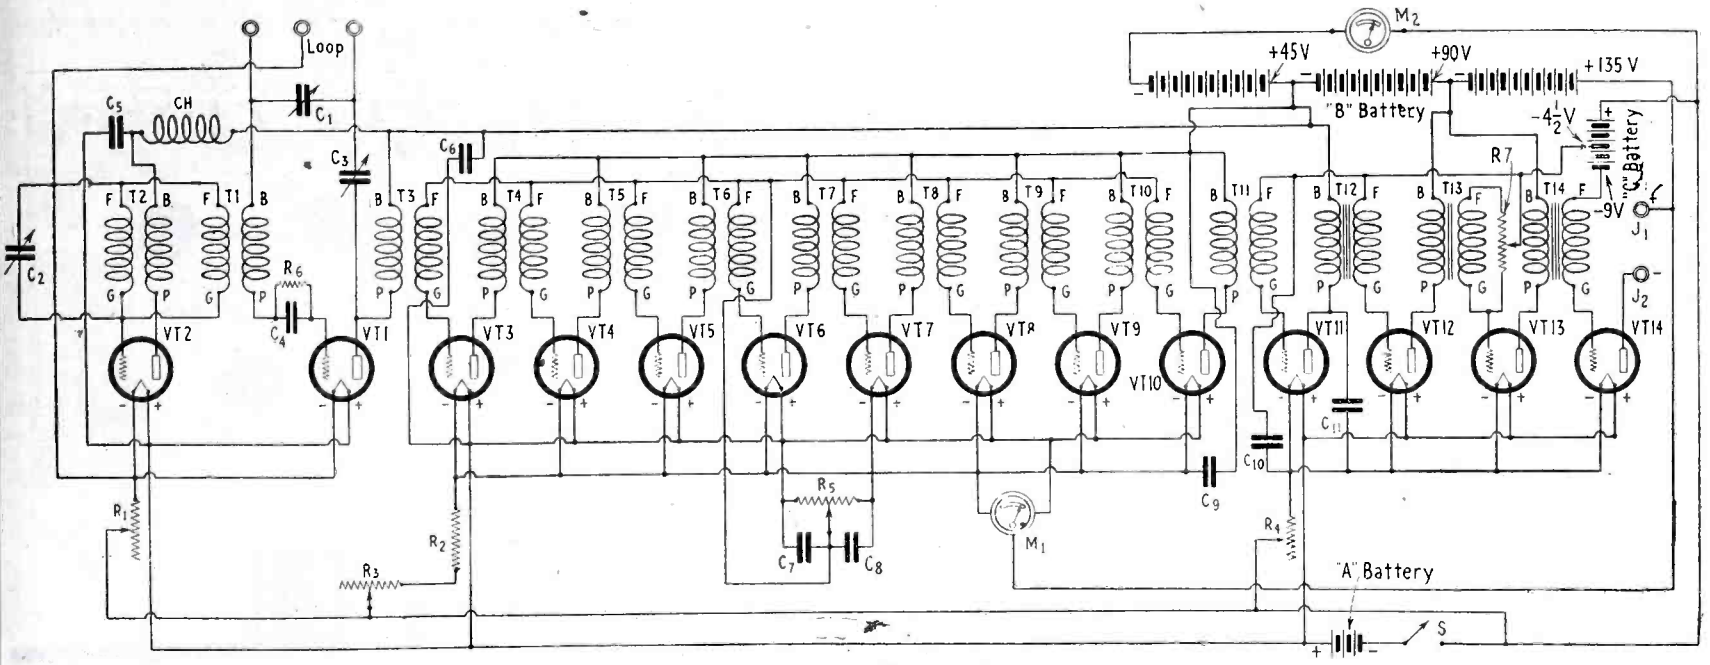
A close-up photo of the front panel showing the arrangement of dials, meters, etc.



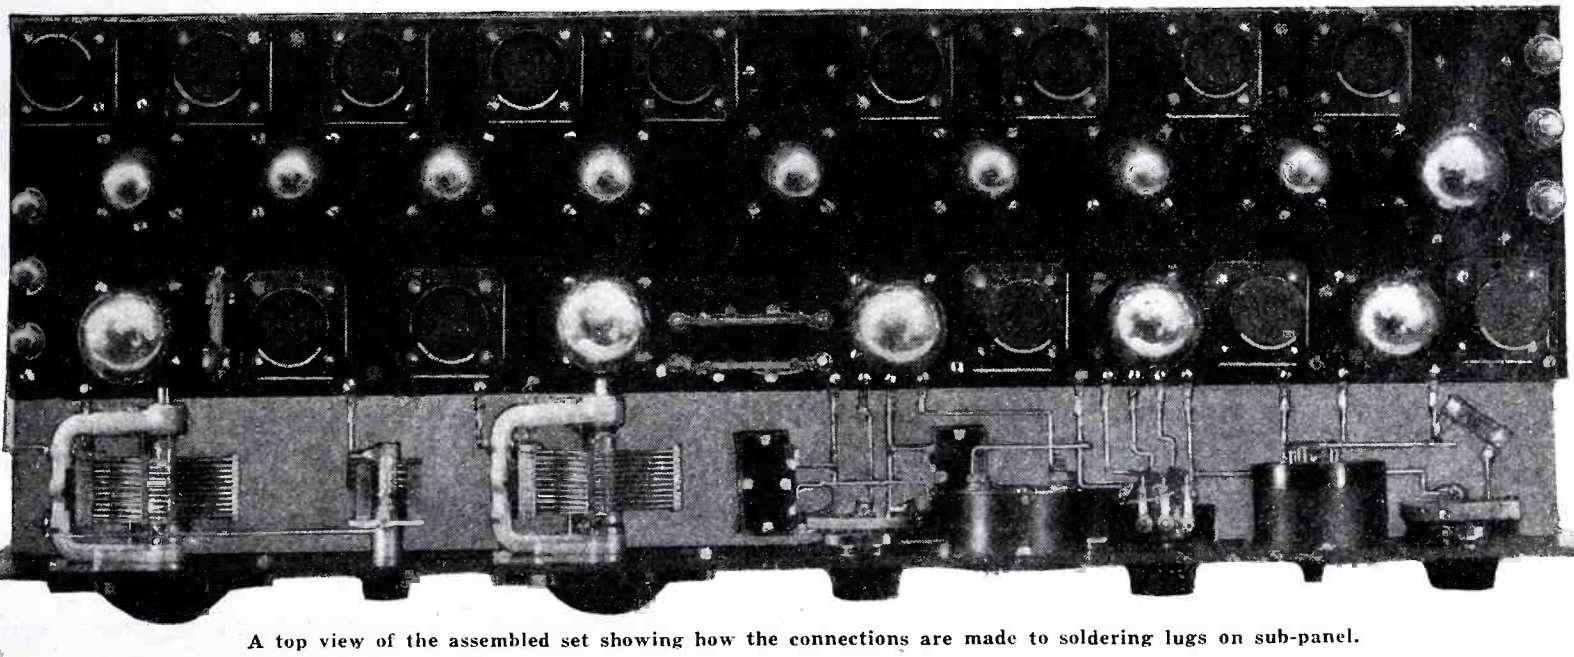
with an eight stage intermediate amplifier such as the "Hot Spot" Fourteen receiver, would produce much greater overall amplification, even if its amplification per stage were say four, than would a receiver in which is included a four stage amplifier with an average amplification of 10 per stage. The actual overall amplification of the former would be 65,536 as compared with 10,000 for the latter.

Following the above reasoning it is easy to understand why this receiver is unusually sensitive to weak signals from extremely distant stations. This multiplicity of intermediate-frequency stages also accounts for the extremely high selectivity. We know, for instance, that a two stage radio-frequency amplifier which is very broad in tuning can be sharpened tremendously by adding another stage of R.F. It follows that where several stages are used, each individual stage need not be sharp because the cumulative sifting out effect of one stage after another results in a high degree of overall selectivity.

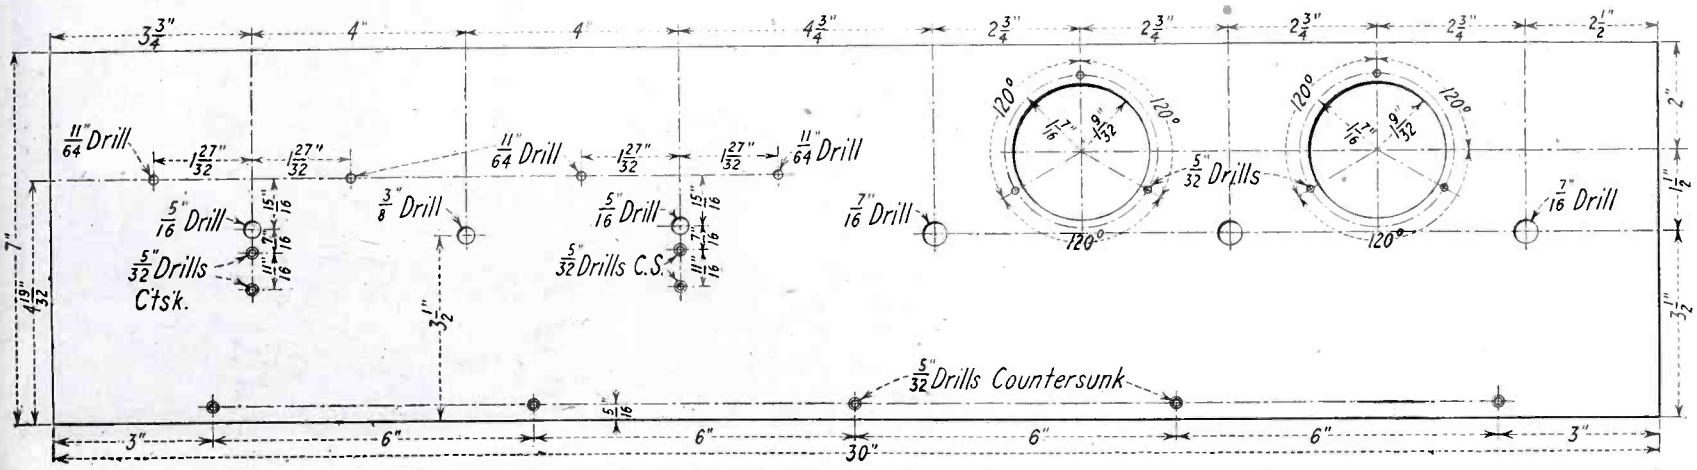
Just the assurance of ample selectivity is not the only consideration. How the selectivity is obtained is of equally great importance, because if there is any cutting of side bands there will be distortion and therefore poor quality of reproduction. This calls for careful design in the interstage coupling units in the case of a super-heterodyne receiver, which will result in just the proper frequency cut-off to include the necessary side-bands and no more. This has been accomplished in the "Hot Spot" receiver.



Schematic wiring diagram of the "Hot Spot" Fourteen receiver.



A top view of the assembled set showing how the connections are made to soldering lugs on sub-panel.



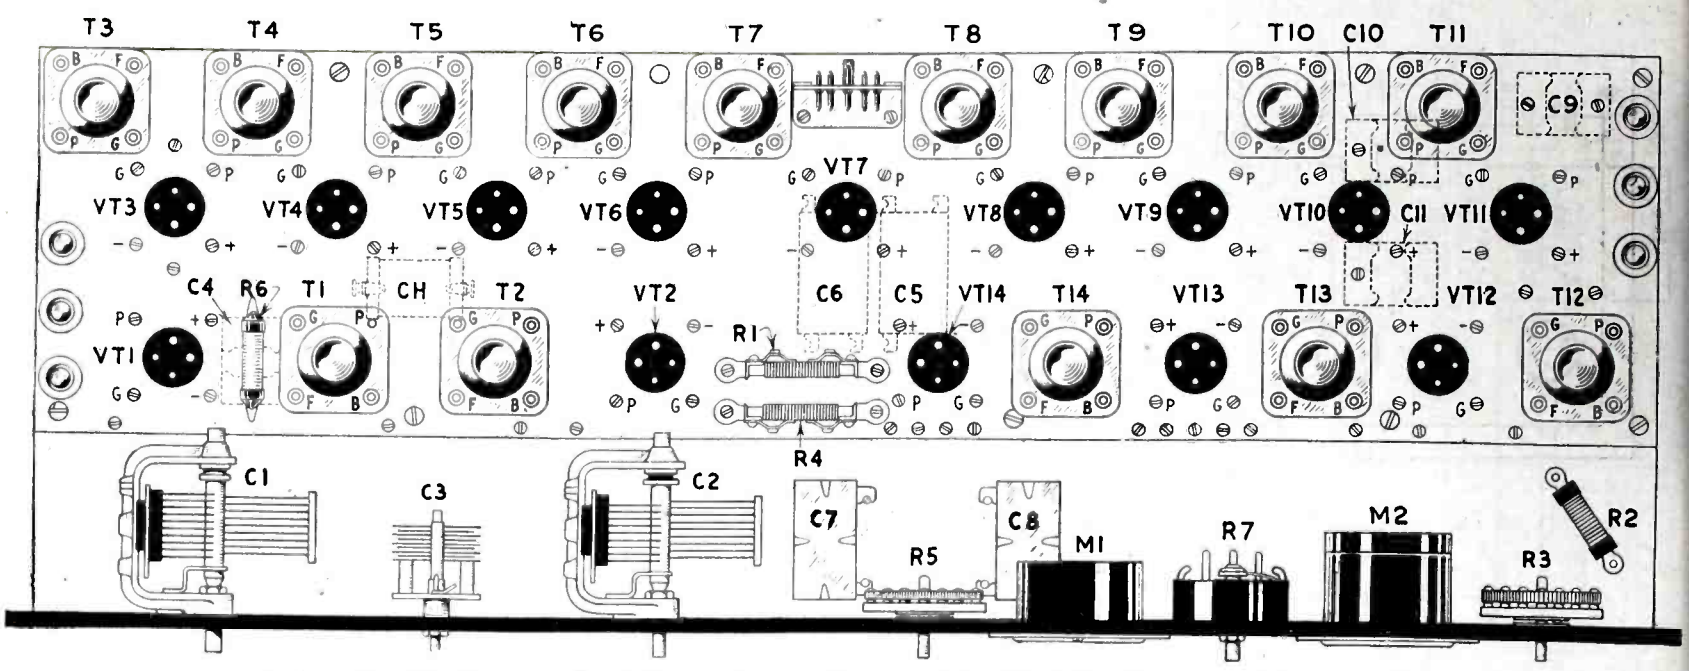
Front panel drilling layout giving dimensions of all holes.

Stability in the intermediate amplifier is obtained, in this receiver, through careful and proper design of the intermediate-frequency transformers, and the desired end has been attained to such a surprising degree that this receiver is as stable in operation as many receivers that employ only two or three stages of intermediate amplification; in fact it is more stable than many of the present day tuned R.F. receivers.

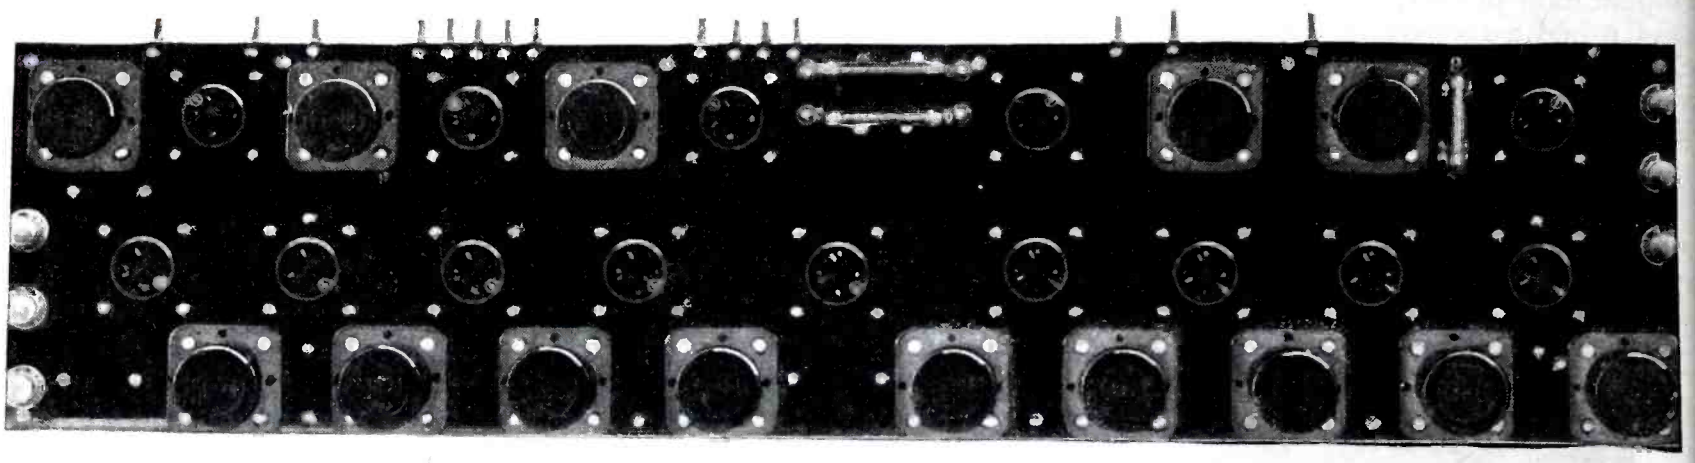
One reason for this stability lies in the fact that the peculiarities and requirements of each individual stage have been studied and the transformers are designed to meet these requirements. That is why it is imperative that the intermediate transformers be connected in the order given. The transformer for each stage has been given an individual type number, the last unit of which corresponds with the number of the stage in which the transformer is to be used. For instance, Melocoupler Type No. 461 is for use in the first stage, No. 463 is for use in the third stage, etc.

Of course, in any amplifier of this type, the use of a potentiometer to provide positive bias will prevent oscillation in the amplifier but the bias required to prevent oscillation in an unstable amplifier is just the opposite to the bias required for good amplification, therefore when oscillation is stopped with the potentiometer, the sensitivity of the receiver is shot to pieces. In the case of the "Hot Spot" receiver the stability is of such an order that the grids can be swung over to negative and still the amplifier will not oscillate and it is in this negative position that maximum sensitivity and maximum selectivity are both to be found.

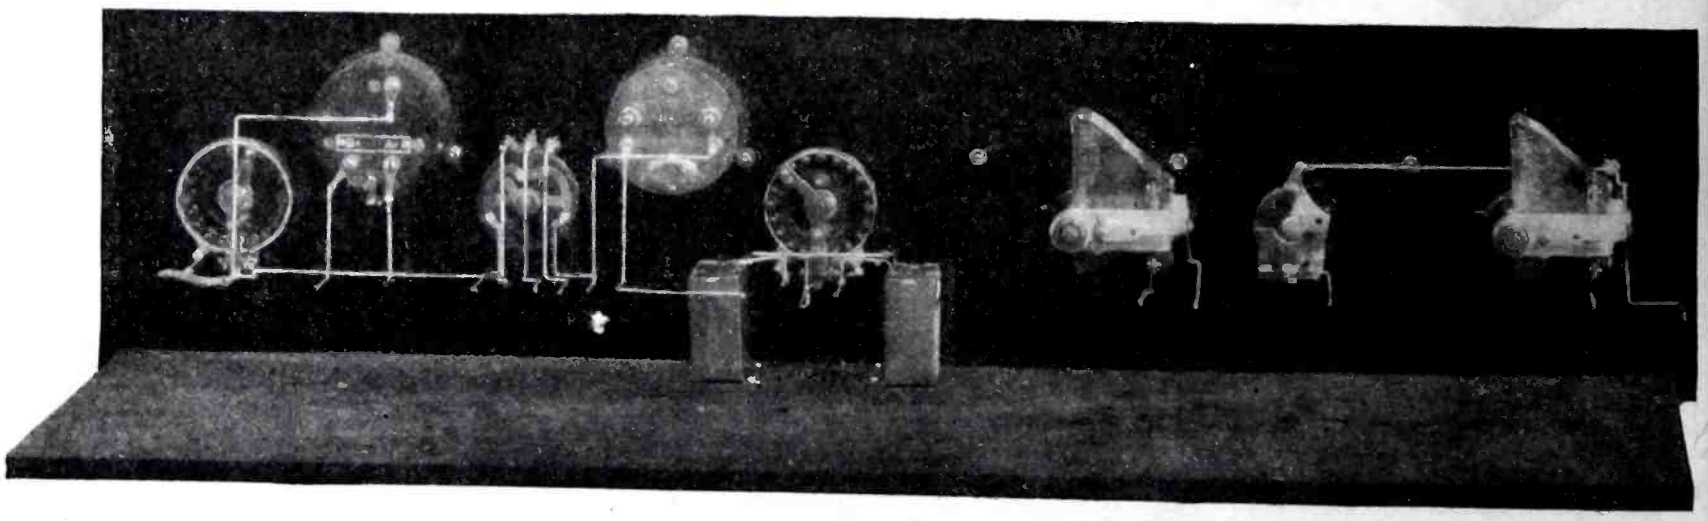
A novel oscillator coupling scheme has been employed to isolate the plate



Instrument assembly on panels. Letters and numerals correspond with wiring diagrams and list of parts.



A top view of the sub-panel showing the layout of parts. Note the connection lugs on the top edge of panel.



A rear view of the front panel and parts with the sub-panel assembly removed.

coil of the oscillator from the pick-up coil and other parts of the circuit. This is accomplished through the agency of a link coupling. An R.F. choke is also included in the "B" battery supply lead to the oscillator for the purpose of more complete isolation.

Probably one of the greatest bugbears of super-heterodyne owners is the double repeat point found in the tuning of almost every super. That is, when a station is tuned in on the loop, it may be heard at two distinct points on the oscillator dial. Or, if the loop is broad in tuning, low and high wave stations may come in side by side on the oscillator dial.

There are two ways of avoiding this difficulty. One of them is by fixing the frequency of the intermediate amplifier at a point sufficiently high that repeating on the oscillator dial is impossible. The other means is not a complete remedy but is helpful, and that is to provide sharp tuning in the loop circuit. The first of these two methods is employed in the "Hot Spot" receiver. By employing a higher frequency than usual for the intermediate amplifier the possibility for repeating is entirely eliminated.

So much for the intermediate amplifier and the oscillator circuits. The first detector employs grid detection for the sake of the greater sensitivity of this method. In the case of the second detector, however, the plate method is employed because of the lessened possibility of distortion, particularly where there is so much previous amplification. Moreover, high sensitivity in the second detector is not an important consideration.

The audio frequency amplifier employed consists of three stages, coupled

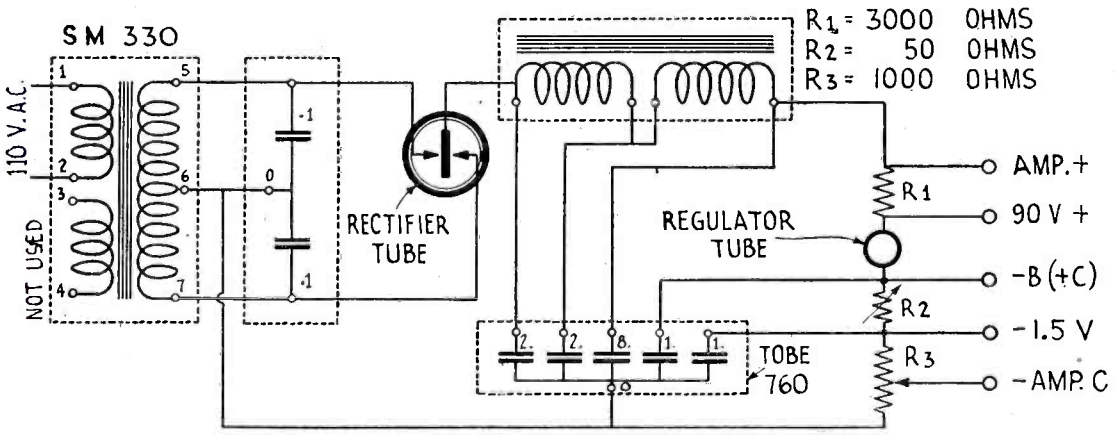
The Electrified Aero-Seven

by Zeh Bouck

IN the fall issue of RADIO LISTENERS' GUIDE & CALL BOOK the writer described the Aero-Seven receiver, one of the season's predominant achievements. It is hardly our custom to become unduly enthusiastic over any receiver, and we qualify our description of the Aero-Seven as a "predominant receiver" by an expression of its consistently good design. The Aero-Seven may be briefly described as combining the excellent points of many receivers while avoiding the majority of unfavorable points.

Since describing the original model, the author has received numerous requests for an A.C. design, in recognition of the general availability of alternating current tubes. This article, and the receiver it describes, is the response to a logical demand.



Wiring diagram of the eliminator employed with the set.

ELIMINATOR PARTS

1 Silver-Marshall 330 Transformer
1 Silver-Marshall 331 Choke Coil
2 Amsco Universal sockets
1 Raytheon BH tube
1 Raytheon type R regulator tube
1 Amsco 1000 ohm Monostat
1 Amsco 50 TT Rheostat
1 Tobe type 311, buffer block

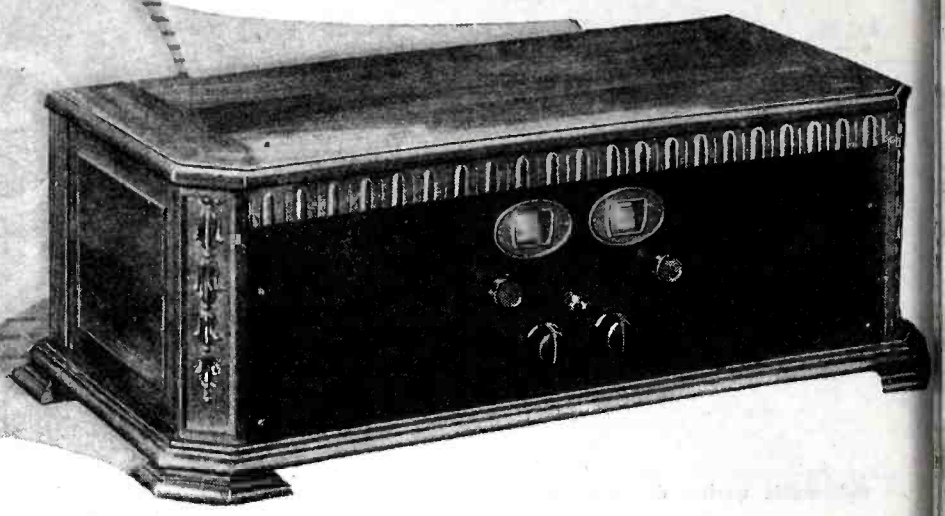
The La Peer AR-9



THE La Peer AR-9 Super is a receiver that depends upon careful design of the intermediate-frequency transformers for its extreme selectivity and high amplification rather than upon the use of an abnormally high number of tubes. For the fan who desires maximum efficiency with minimum cost of construction and upkeep, this receiver presents a logical selection.

If we go back over the history of super-heterodyne receivers we find that resistance coupling was first used for the intermediate amplifier but this method never attained any considerable degree of popularity because the amplification per stage was very low and also the resistance values were inclined to be too critical in adjustment, particularly as we did not have the variety of variable high resistances that we know today.

After resistances came the use of honeycomb coils for the intermediate inter-stage coupling. In this method each intermediate stage was tuned by means of a variable condenser which was connected across the grid coil, and in some cases both the plate and grid circuits of each stage were tuned. With this plan a high degree of efficiency was obtained but, on the other hand there were drawbacks, not the least of which was the large number of tuning controls involved and the more or less critical adjustment of the coupling between stages.

Then came the transformer coupled intermediate amplifiers with their untuned iron-core transformers. These transformers were a decided step forward. They reduced the number of tuning controls to a fairly reasonable figure and provided good amplification per stage. They offered practically no selectivity but this was taken care of by the use of one sharply tuned stage which usually consisted of a pair of honeycomb coils, one of which was shunted by a standard variable condenser by means of which the circuit was tuned. Later the honeycomb coil-variable condenser combination was replaced with a transformer which was tuned by means of a fixed condenser. This stage had been reached about four or five years ago.

1 package Acme Celatsite, flexible hook-up wire.
1 package Kester radio solder.

Receivers such as the one just described were responsible for many thrills to the hardy pioneers who undertook to build them. Tuned radio-frequency amplification at the broadcasting wavelengths was practically unknown at the time and one had to depend upon regenerative detectors for sensitivity. The regenerative detector was capable of bringing in distant stations but usually stations more than about 400 miles distant came in very faintly. The new super-heterodyne receiver, however, had the ability to bring in many of the more distant stations with almost as much volume as the local stations. It therefore became possible to receive distant stations with comfortable volume on the loudspeaker, something which was usually not possible with the average three-tube receiver of the time.

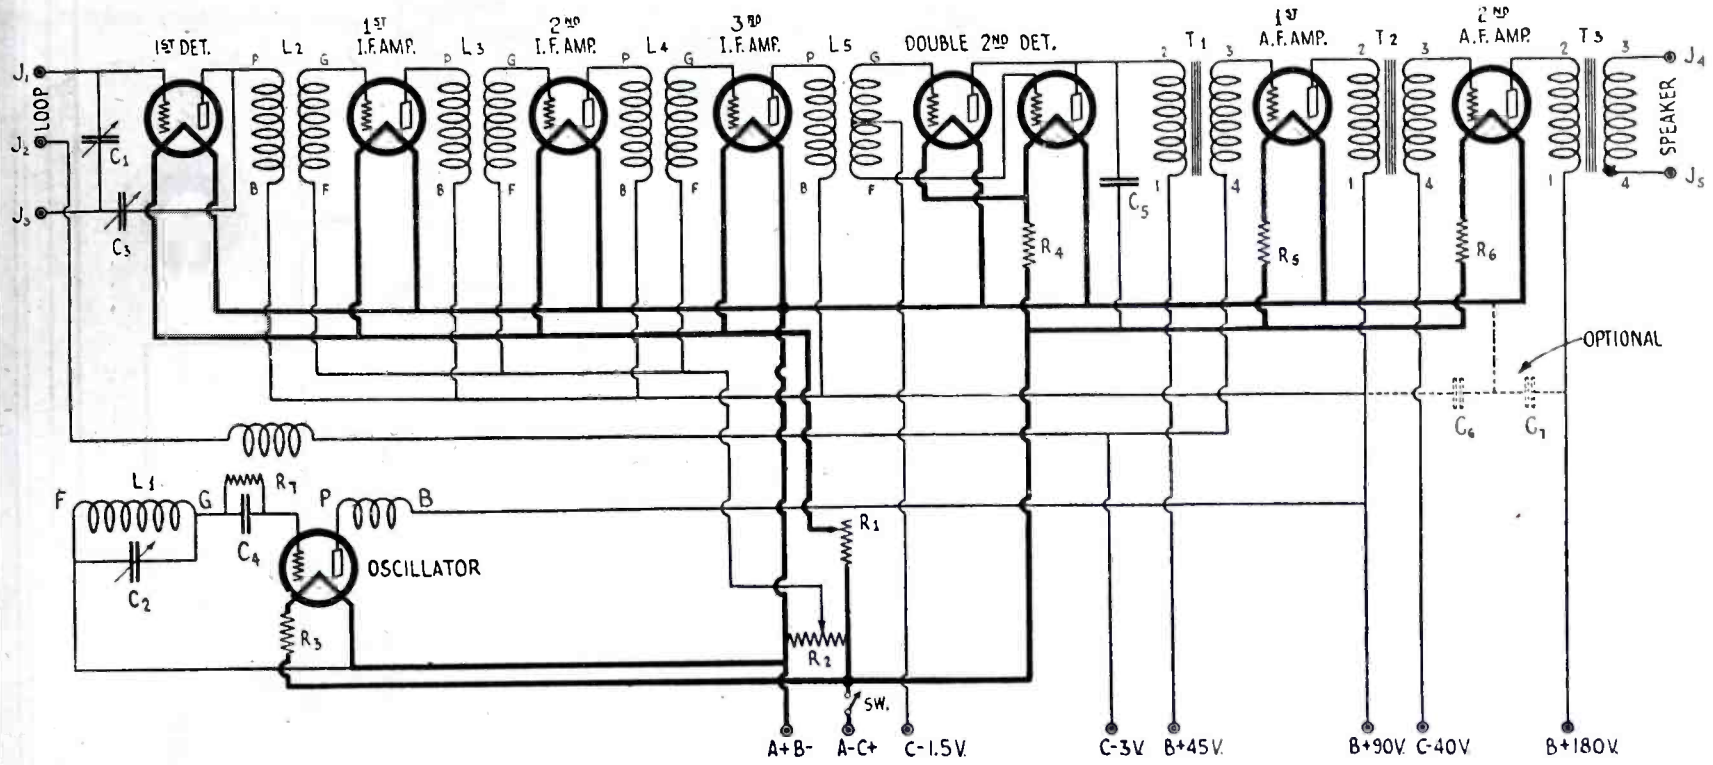
But to "do their stuff" these supers required three or four stages of intermediate amplification and, when the present broadcast band went into use and the number of broadcasting stations began to increase the selectivity of these receivers proved inadequate.

The next progress was made along the lines of broadly peaked intermediate transformers. That is, each transformer had a definite, although rather broad resonance peak, usually somewhere around 5000 meters. Then with a sharply tuned input (or output) transformer to serve as a filter the over-all selectivity of the receiver was considerably improved.

Further improvement was made along this line by using less and less iron in the transformer cores until the resonance peaks of the transformers became so pronounced that it became necessary to match transformers which were to go into a receiver. In other words, if the intermediate-frequency amplifier was to amplify at say 3000 meters each of the untuned transformers would have to be peaked close to this wavelength and the filter trans-

former would have to be shunted by a fixed condenser which would make it peak to correspond with the untuned stages. Much grief was encountered .001 mfd. for instance, and a fixed condenser of this size were purchased it might be found to be actually anywhere from five to a hundred percent

About two years ago some manufacturers had reduced the amount of iron in their transformers to such a degree that each transformer was quite



Schematic wiring diagram of the La Peer AR-9. Letters and numerals correspond with picture diagram and list of parts.

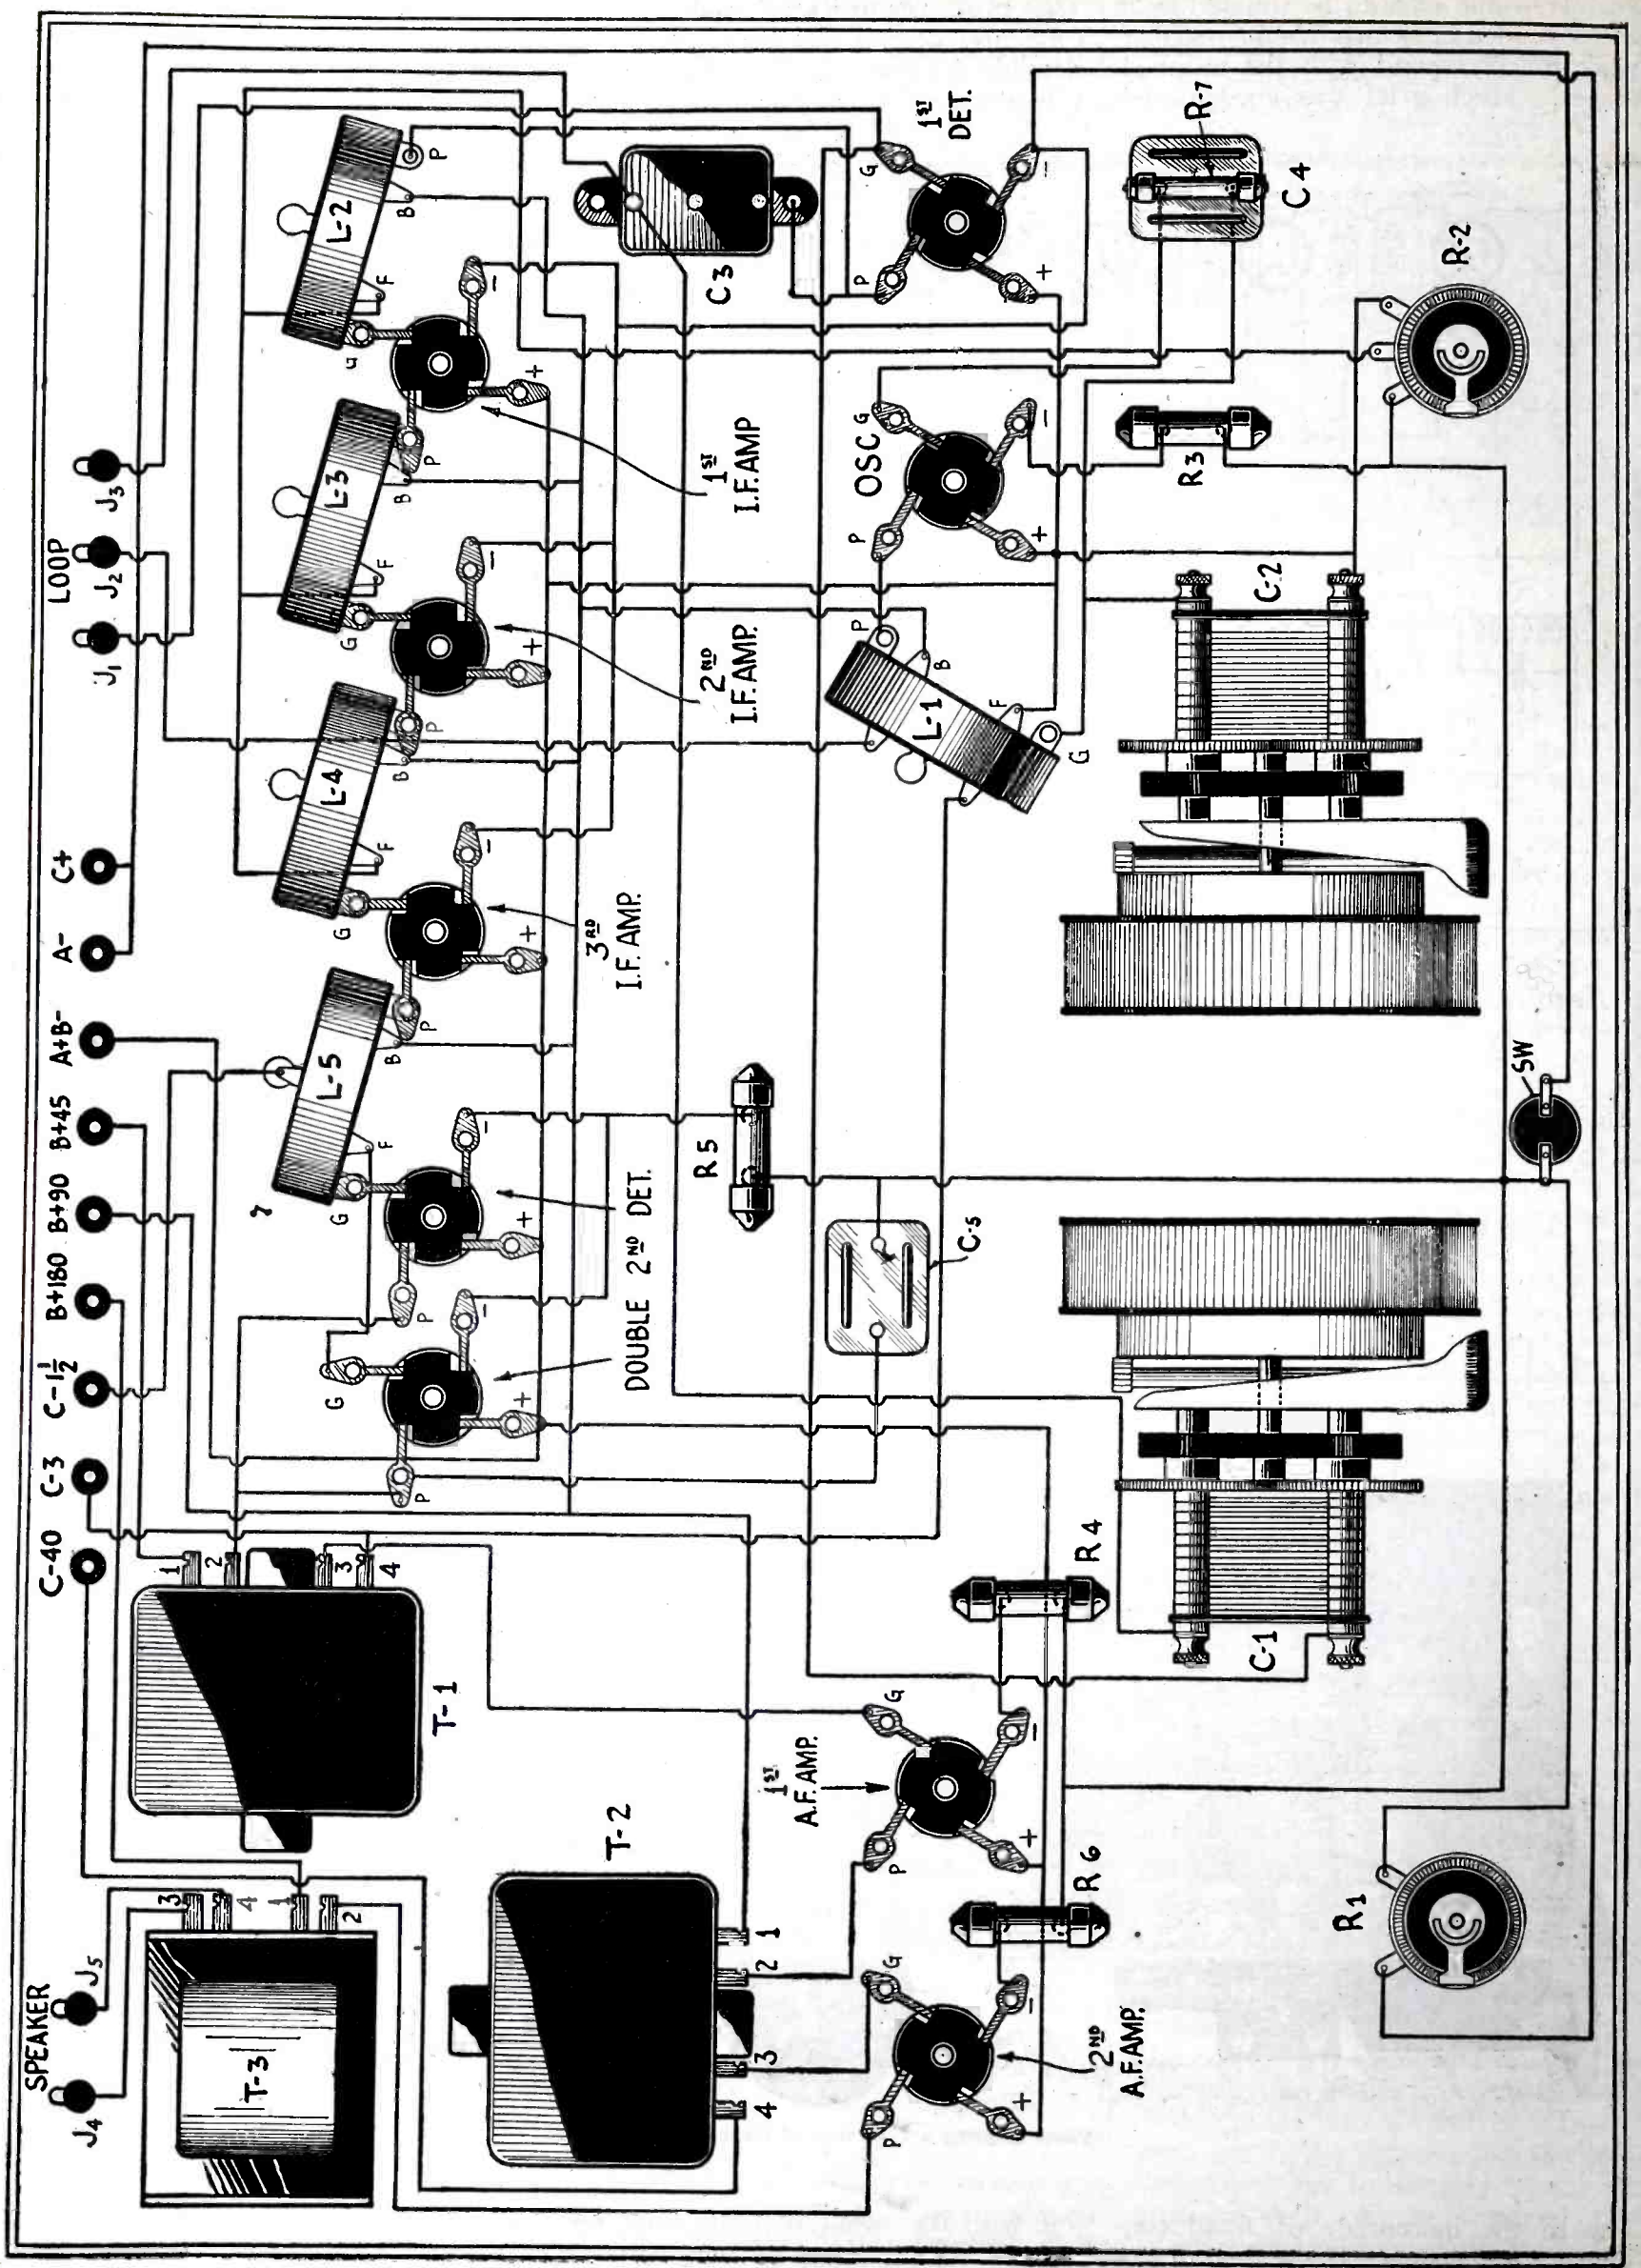
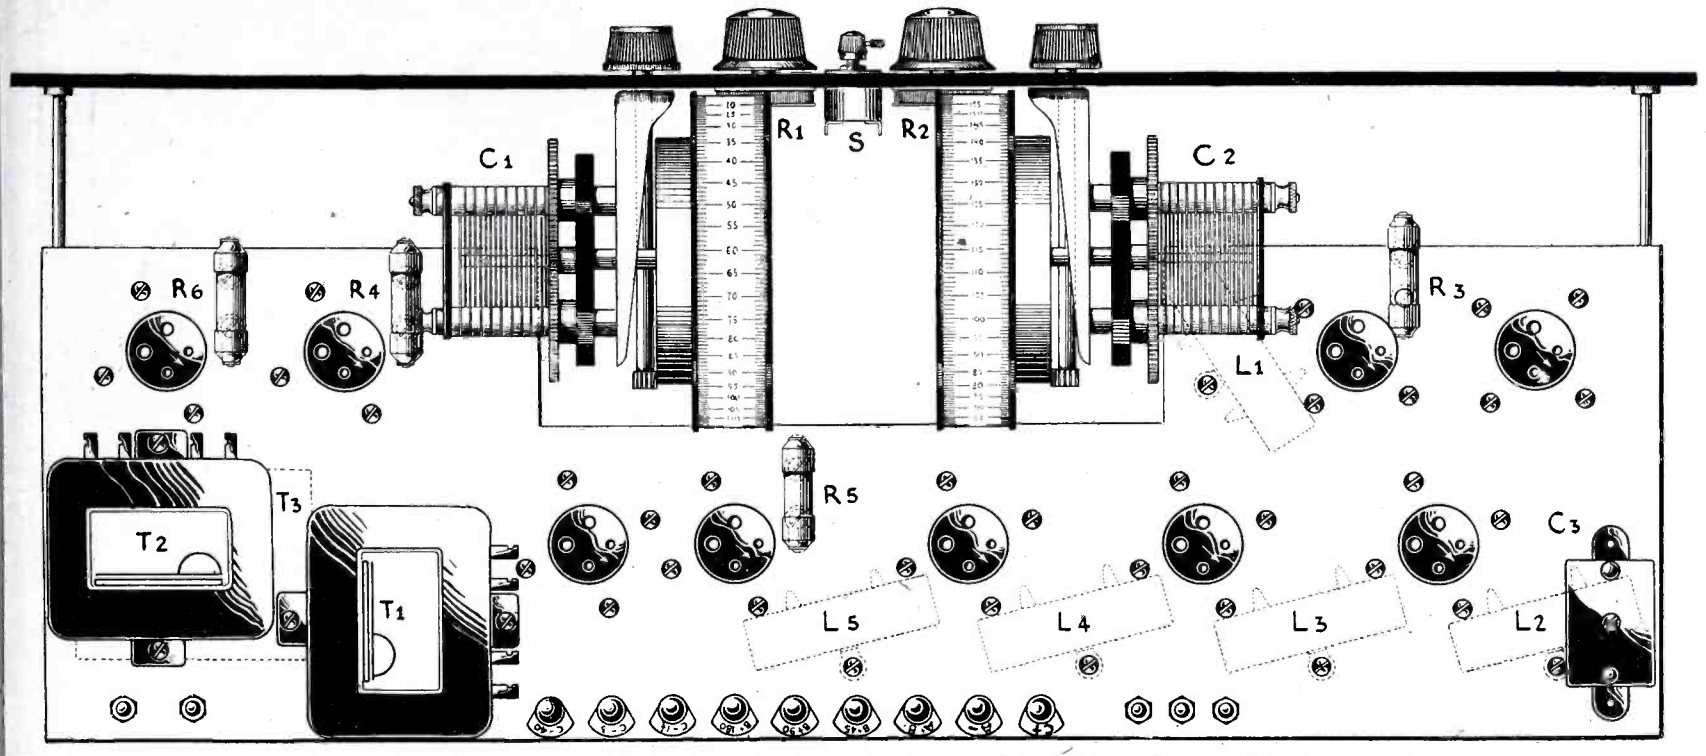
due to the inaccuracy of fixed condensers at the time. If the filter transformer called for a shunt capacity of

off with the result that the filter circuit would be all out of tune with the rest of the amplifier.

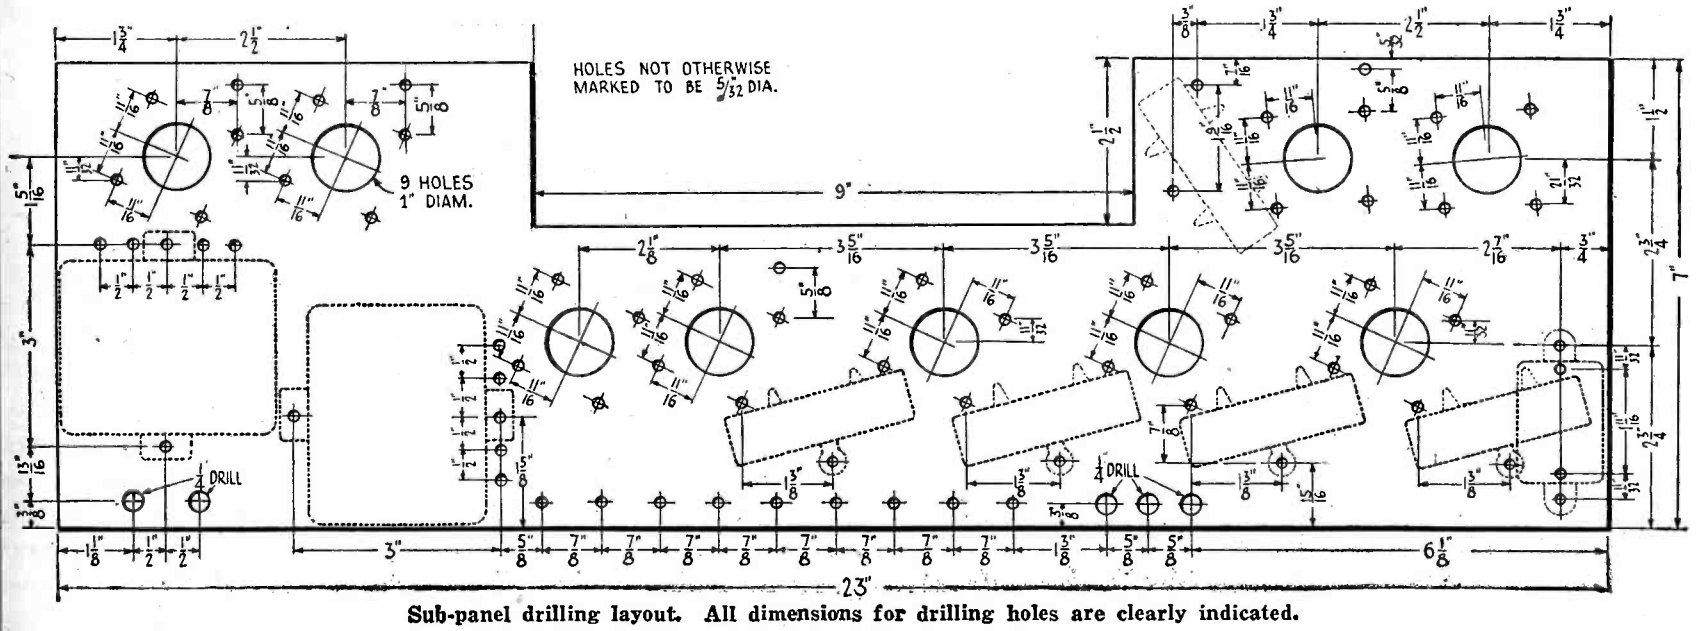
sharply tuned and the efficiency per stage of an amplifier that used these transformers was increased to such a



degree that two stages of intermediate-frequency amplification became ample. This required extremely careful matching of the transformers which were to be employed in a receiver and in many cases the manufacturers furnished the fixed condensers of exactly the right capacity to properly tune the filter transformer. In this way it was fairly certain that when a receiver was constructed the intermediate amplifier would be properly tuned and highly efficient.



Layout of parts on the front and sub-panel. Parts are indicated to correspond with wiring diagrams.



Sub-panel drilling layout. All dimensions for drilling holes are clearly indicated.

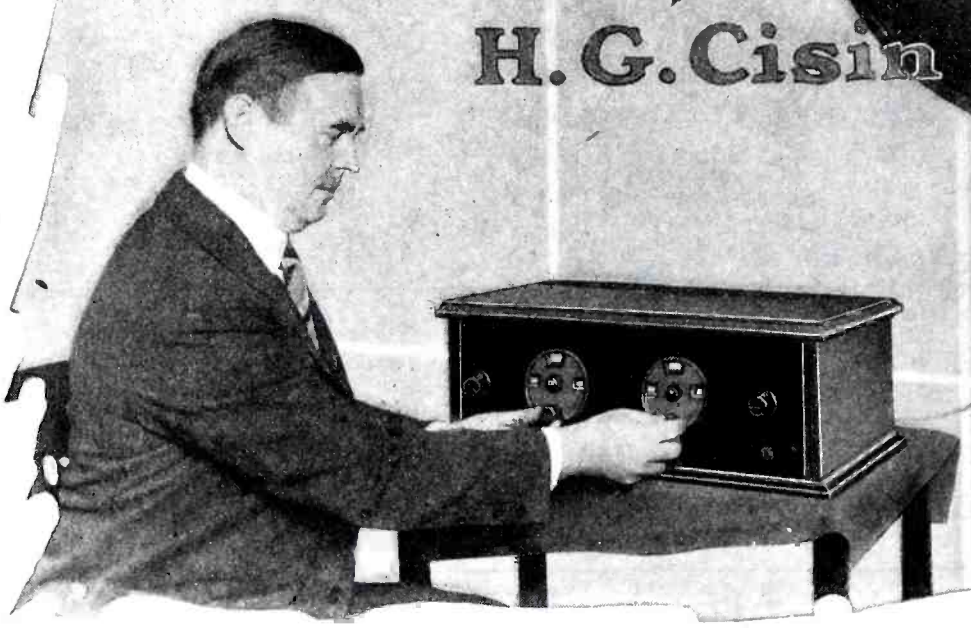
How to Build the Intertrol Five

by H. G. Cisin



THE regenerative principle is still the object of considerable experimentation and research on the part of those interested in the development of radio. The Intertrol Five features a regenerative detector in which regeneration is automatically controlled. In this circuit, operation is distortionless. There are no whistles, squeals or howls, such as are present in the usual regenerative receiver.

The intertrol circuit consists of one stage of tuned radio frequency, a regenerative detector, one stage of transformer coupled audio frequency amplification, and two stages of step-up impedance coupled audio frequency amplification. Auto-couple coils are used both for the antenna coupler and for the inter-stage radio frequency transformer. As the tuning condensers are rotated, the coupling between the primaries and the secondaries of the auto-couple coils is automatically varied, being made less close at short wave lengths, where the energy transfer would be greater and the selectivity would be consequently lessened. Changing the coupling in this way provides a constant transfer of energy, and results in uniform selectivity over the entire wave length range. Shielding is provided for the radio frequency stage and also for the detector stage. This eliminates any interaction between circuits, prevents direct pick-up, and adds to the stability and efficiency of the receiver.

The special arrangement of the regenerative detector should be noted, because of the greatly improved results which are attained. The plate of the detector tube, in addition to being connected to the primary of the audio transformer, is connected back through the small variable condenser C_2 to point "P", this being one end of the primary of the auto-couple coil (L_1). This causes the portion of the primary, B-P, to act as a tickler coil. As the coupling between the primary and secondary of the coil is varied with the rotation of the variable tuning con-

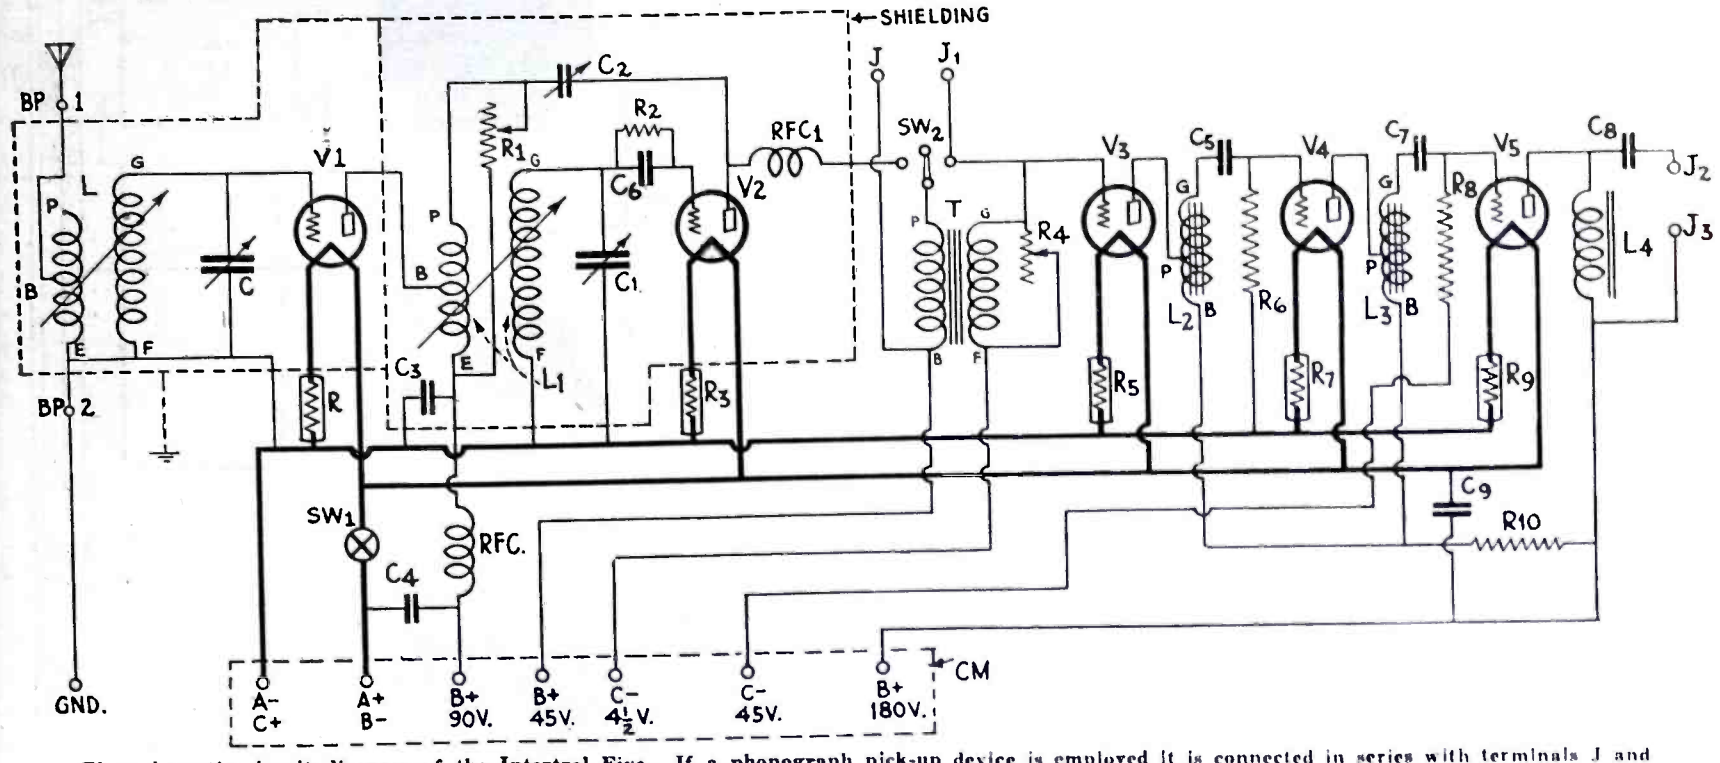
LIST OF PARTS REQUIRED FOR THE INTERTROL FIVE

- 2 Marco vernier dials, type 192.
- 2 Hammarlund .00035 mfd. midline variable condensers (C, C_1)
- 2 Hammarlund auto-couple coils (L, L_1)
- 2 Hammarlund aluminum shields, 6"x 7"x6"
- 4 Amperites, No. 1-A, with mountings (R, R_3, R_5, R_7)
- 1 Amperite, No. 112, with mounting (R_9)
- 5 Eby sockets
- 2 Hammarlund R. F. chokes, 85 m. h. (RFC, RFC_1)
- 1 Thordarson transformer, type R-200 (T)
- 2 Thordarson Autoformers (L_2, L_3)
- 1 Thordarson 30 henry choke, R-196 (L_4)
- 1 Electrad Royalty variable resistance, type "G" (R_1)
- 1 Electrad Tonatrol (R_4)
- 1 Muter .00025 mfd. grid condenser with clips (C_6)
- 1 Lynch 3 meg. metallized resistor grid leak (R_2)
- 1 Muter .001 mfd. by-pass condenser (C_3)
- 3 Acme "Parvolt" ½ mfd. series "A" condensers (C_5, C_7, C_9)
- 1 Acme "Parvolt" 1 mfd. series "A" condenser (C_4)
- 1 Acme "Parvolt" 2 mfd. series "A" condenser (C_8)
- 1 X-L Variodenser, type G-10 (C_2)
- 2 X-L push-posts (BP_1, BP_2)
- 1 Carter "Imp" Filament Switch (SW_1)
- 1 Carter, single-pole double-throw switch (SW_2)
- 1 Lynch 0.5 meg. resistor (R_6)
- 1 Lynch 0 25 meg. resistor (R_8)
- 1 Lynch 0.1 meg. resistor (R_{10})
- 3 Lynch single resistor mountings
- 4 Yaxley "pup" jacks (J, J_1, J_2, J_3)
- 1 Yaxley cable plug (CM)
- 1 roll Acme Celatsite wire
- 1 package Kester radio solder
- 1 Formica panel, 7"x21"x$\frac{3}{16}$"
- 1 Formica sub-panel, 7"x20½"x$\frac{3}{16}$"
- 1 Southern Toy Co "Iveyline" cabinet, 7"x21"x10"
- 1 B. M. S. "Via-Rad" electric phonograph reproducer
- 1 Ensco 3 ft. loud speaker kit

denser C_1, the oscillation control is practically automatic. It follows that regeneration is attained at a point of maximum efficiency and without distortion, squeals or howls. In order to get still finer adjustment of regeneration, the primary of the auto-couple coil is shunted by the variable resistance (R_1).

The design of the audio circuit presents an ideal combination of a transformer with two additional stages of step-up impedance coupling. Volume control is provided by a variable resistance connected in parallel with the secondary of the audio transformer. This gives extremely smooth variation of volume, with regulation to just the degree required. An output filter is provided, consisting of a choke and a 2 mfd. filter condenser.

The system of audio amplification used in the Intertrol Five leaves nothing to be desired insofar as tone quality is concerned and since the audio chokes are step-up impedances, there is no diminution of volume, such as would be noticed in resistance coupling.



The schematic circuit diagram of the Intertrol Five. If a phonograph pick-up device is employed it is connected in series with terminals J and J1. SW2 acts to switch from radio to phonograph pick-up or vice versa.

In line with modern standard practice, Amperites are used to furnish automatic filament control. Vernier dials of the type specified are recommended, since they are non-microphonic and entirely free from backlash. The sockets used are especially adapted to sub-panel wiring, although they are mounted on top of the sub-panel. A radio frequency choke is used for keeping R.F. current from the audio circuits and an R.F. choke is also placed in the B plus 90 lead, thus obstructing this path for R.F. currents which are consequently by-passed through the .001 mfd. fixed condenser.

The layout of the panel is an index to the simplicity of design of the entire set. At the left the filament switch is located. At the right, a switch is provided for changing from radio to electric phonograph pick-up. Both loud speaker and pick-up devices are connected to the receiver by means of phone-tip jacks located on the sub-panel. The matter of connecting the batteries to the set has been simplified by the use of a Yaxley cable plug mounting (CM) placed under the center of the sub-panel. X-L push-posts are provided for connecting both aerial and ground.

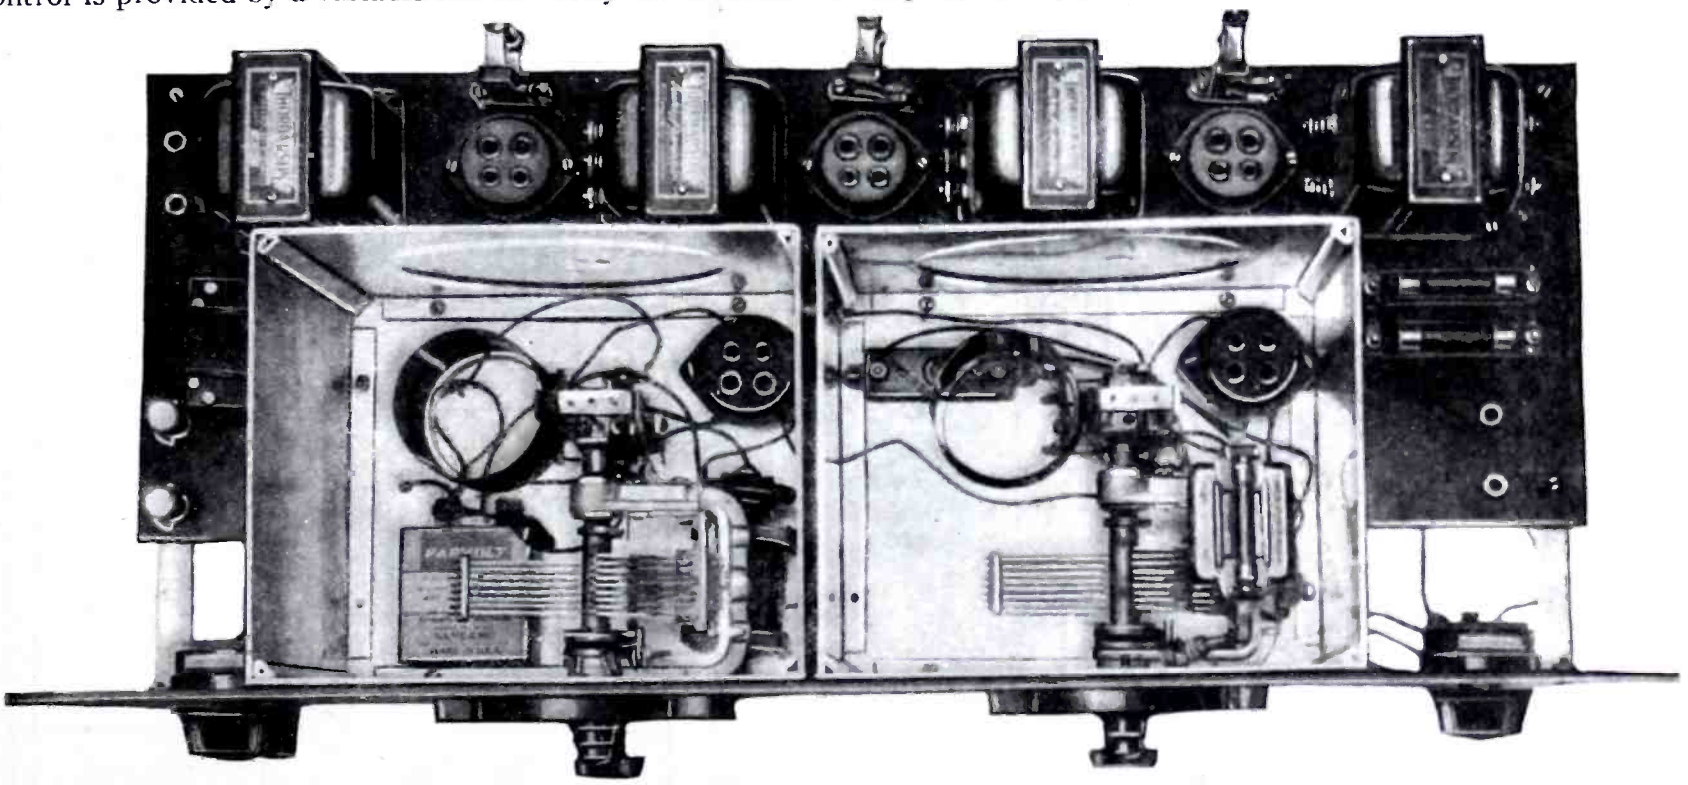


Photo showing a top view of the set with shielding covers removed.

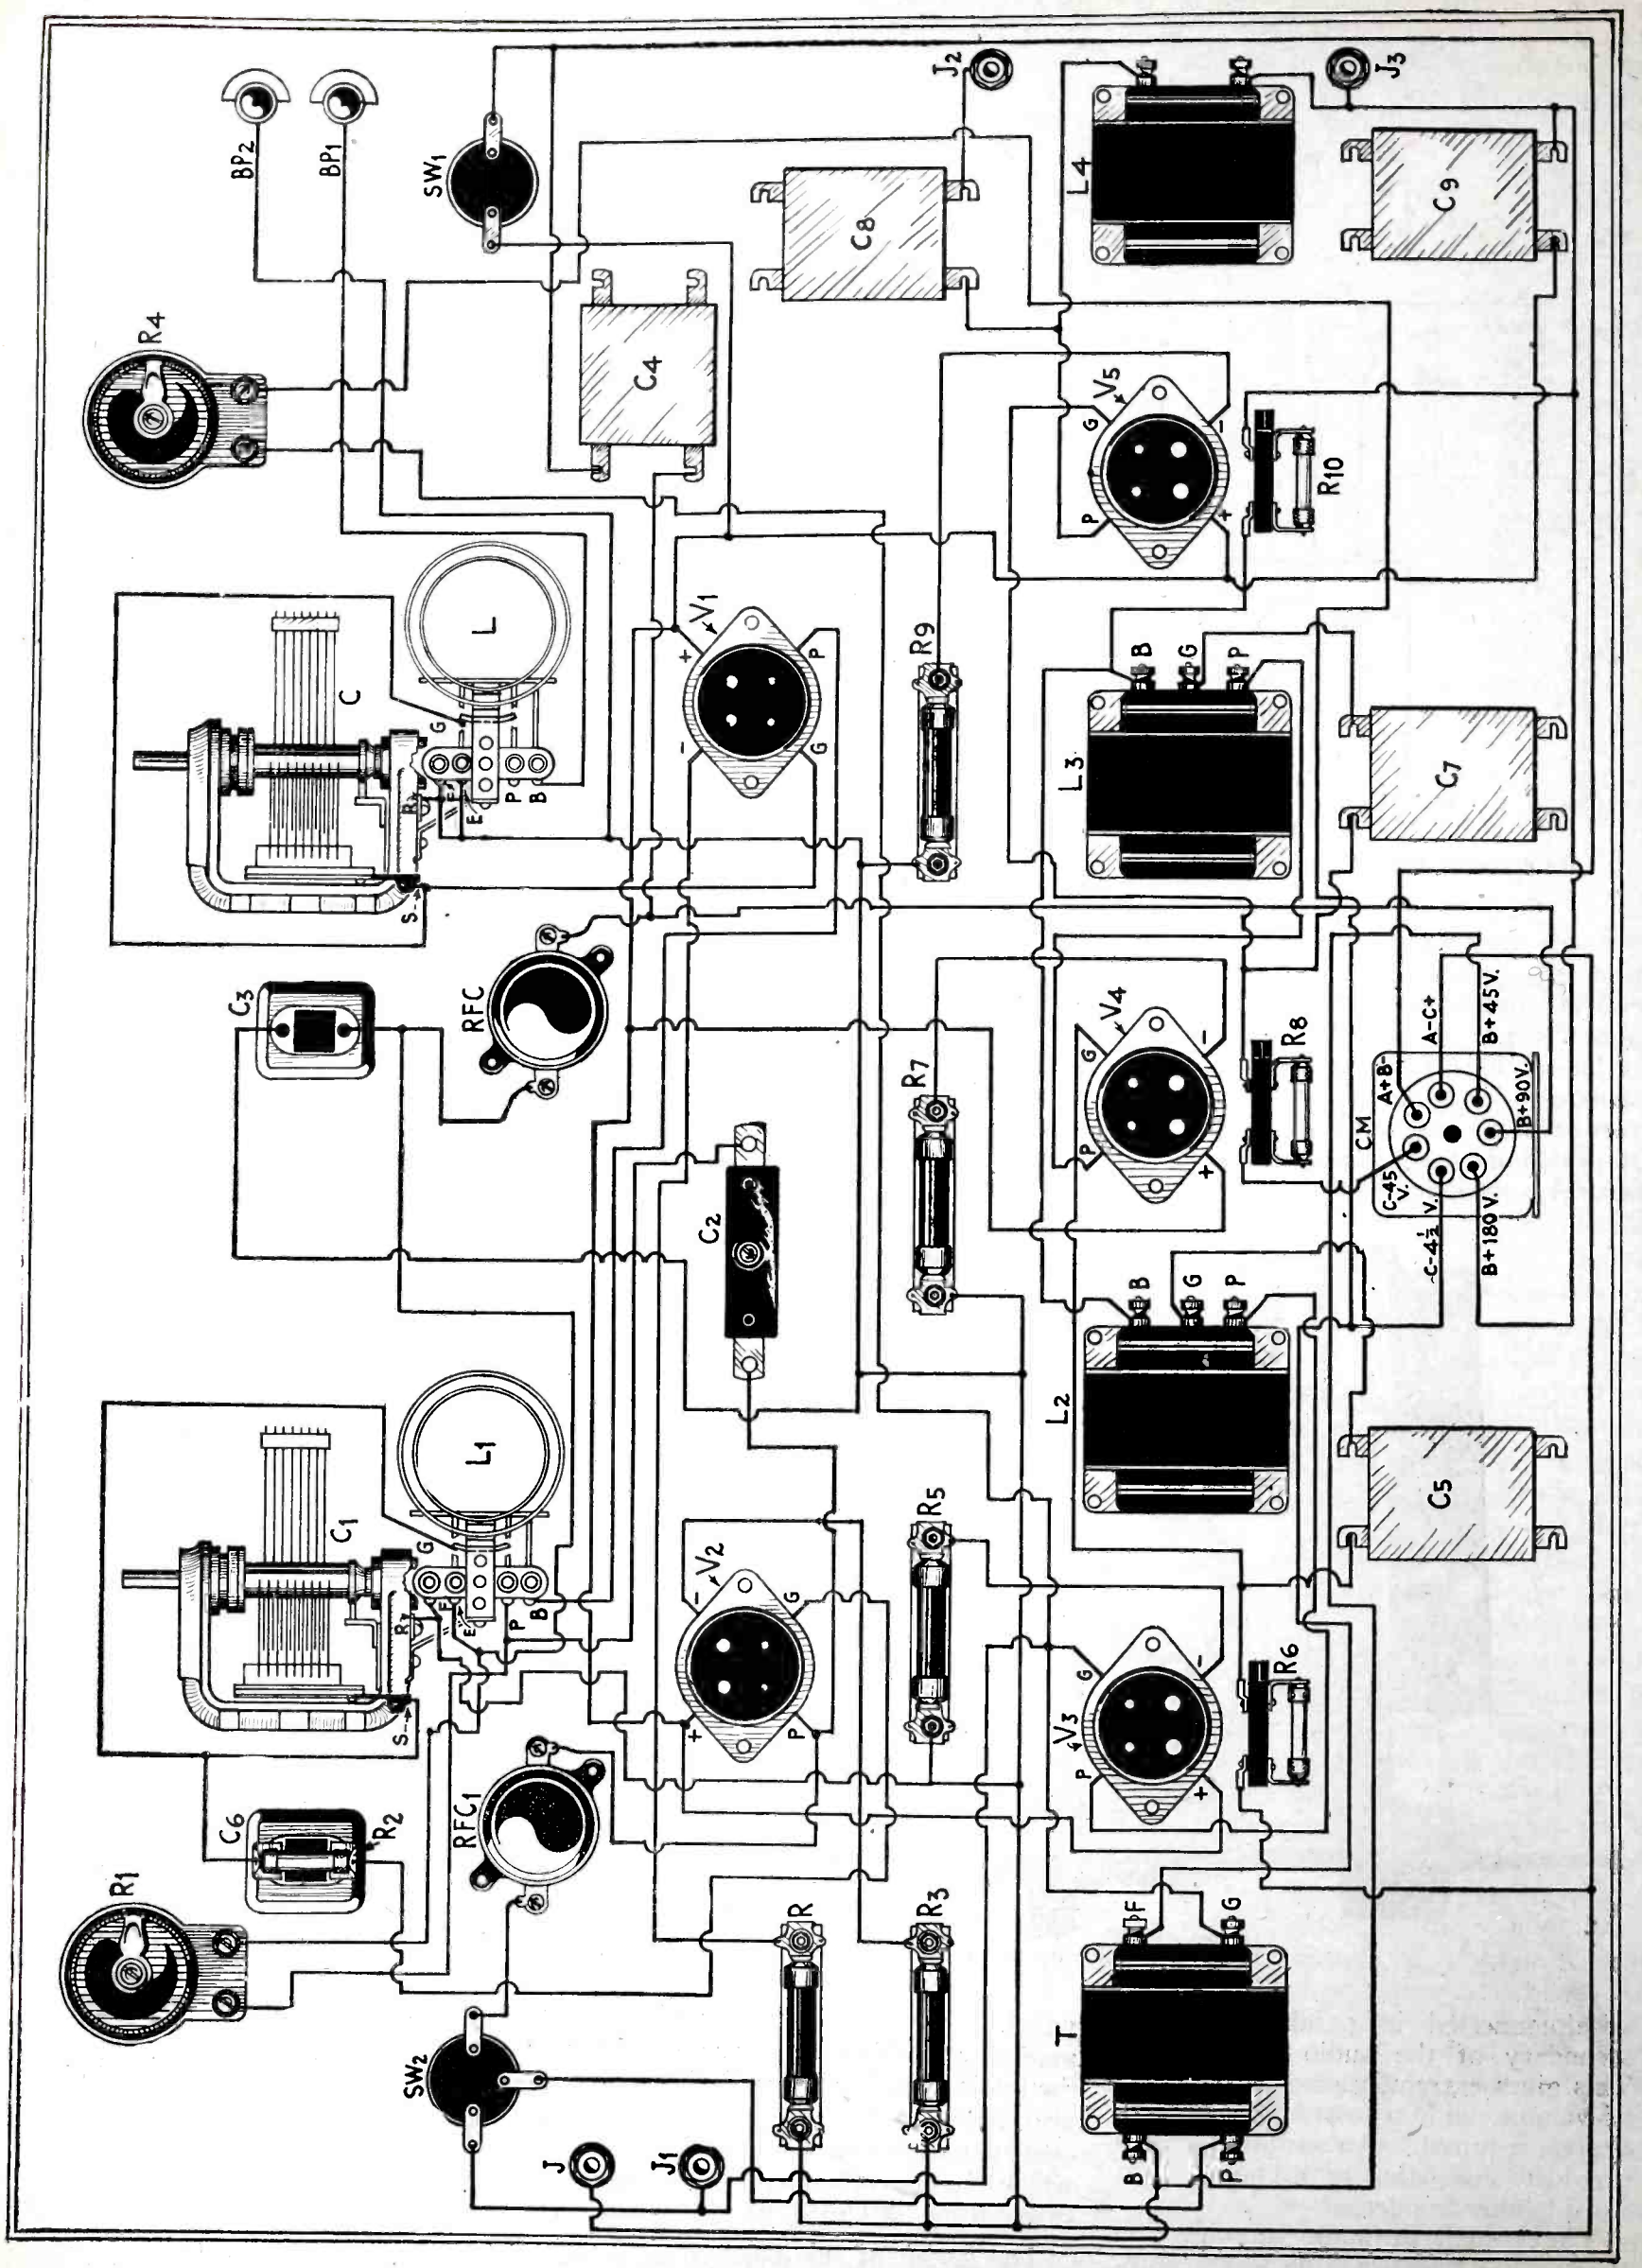
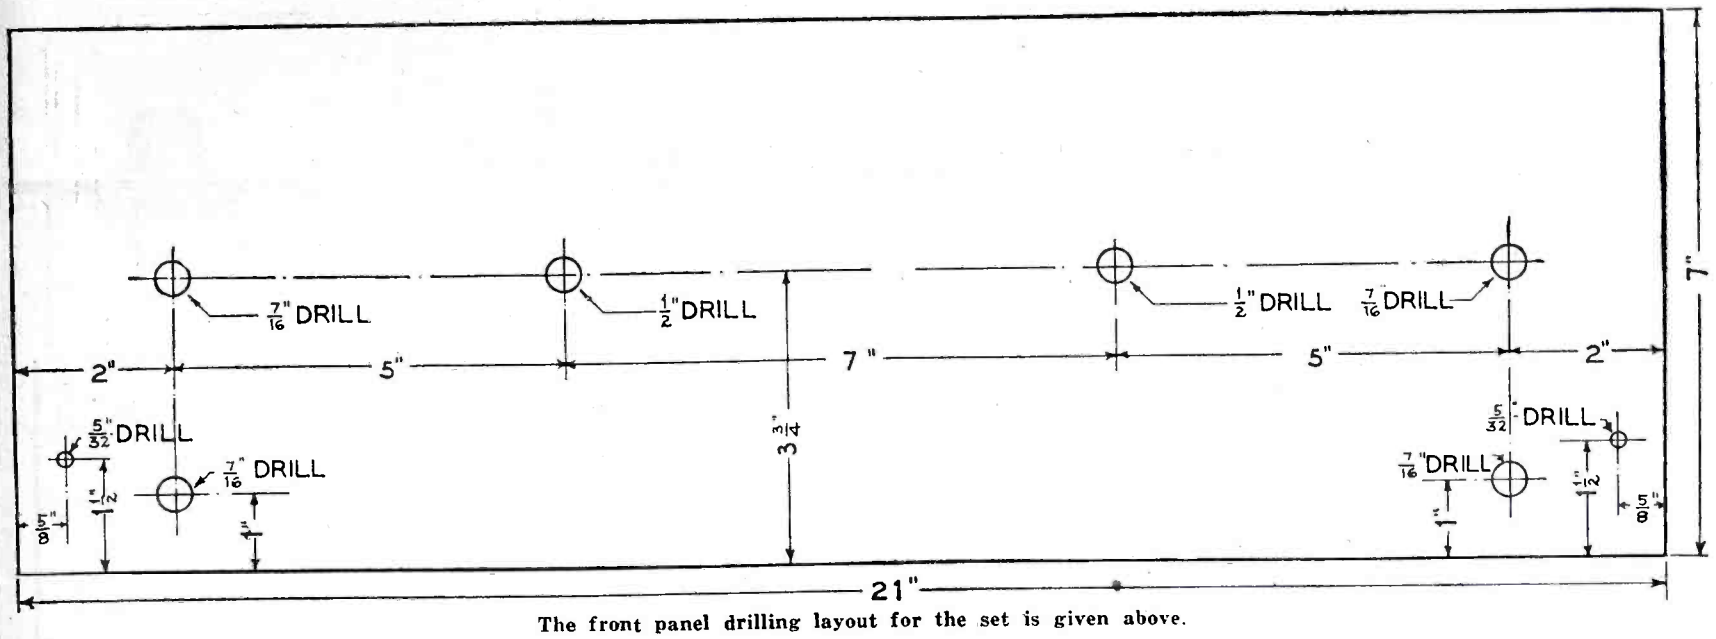
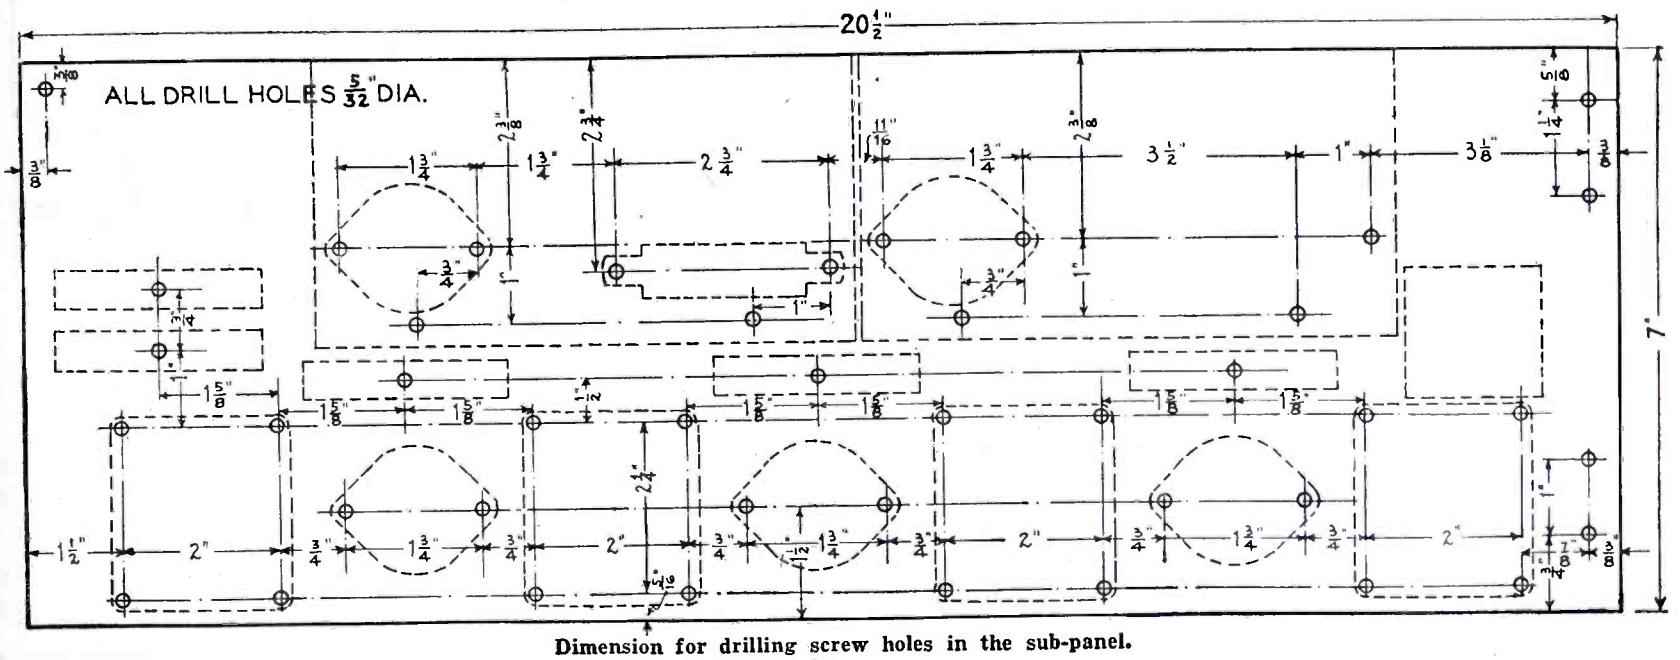
Very often the matter of using the proper tube in a receiver will make a vast difference in the results obtainable. "CeCo" tubes are recommended for use with the "Intertrol Five" as these will give highly satisfactory performance. The detector tube should



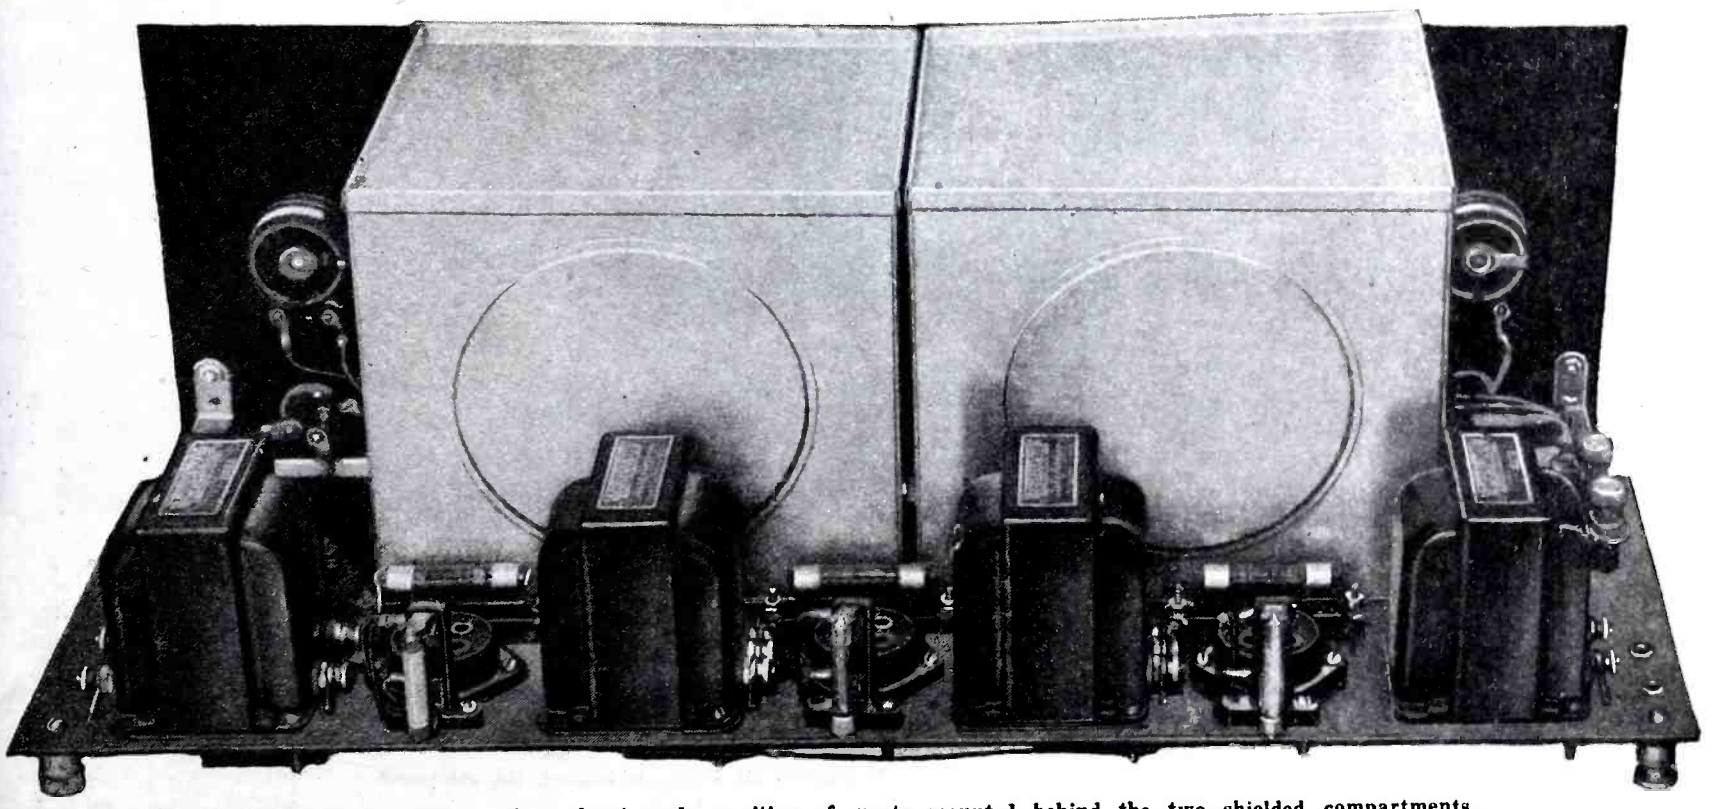
be a type "H" special detector. The "J-71" "CeCo" output tube is required for the last audio stage. The other tubes may be "CeCo" type "A" tubes, although a type "G" is preferable in the stage preceding the last. The com-



The front panel drilling layout for the set is given above.



Dimension for drilling screw holes in the sub-panel.



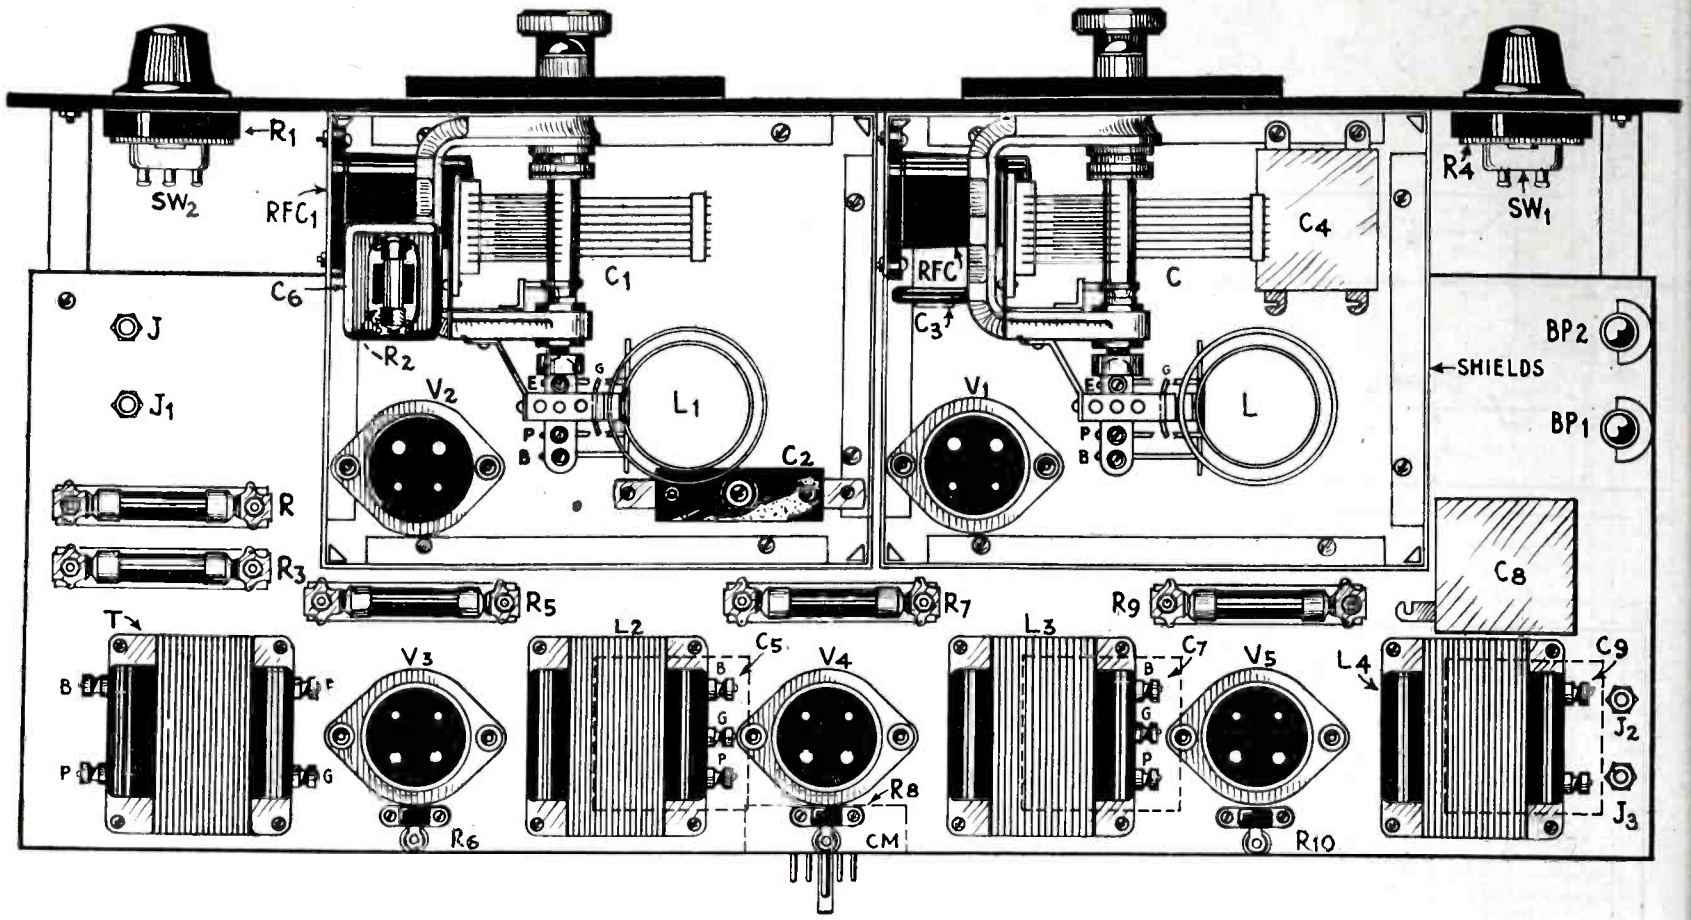
A rear view of the receiver showing the position of parts mounted behind the two shielded compartments.

for use on a radio table. However, the set may also be placed in a console such as the Excello style R-29.

The Ensco 3-ft. cone speaker is one ideally suited to the "Intertrol" circuit. This speaker is obtainable in kit form, and is very easy to assemble. It is capable of handling great volume without a suggestion of distortion and its

tone quality will be a revelation to those who have never heard it.

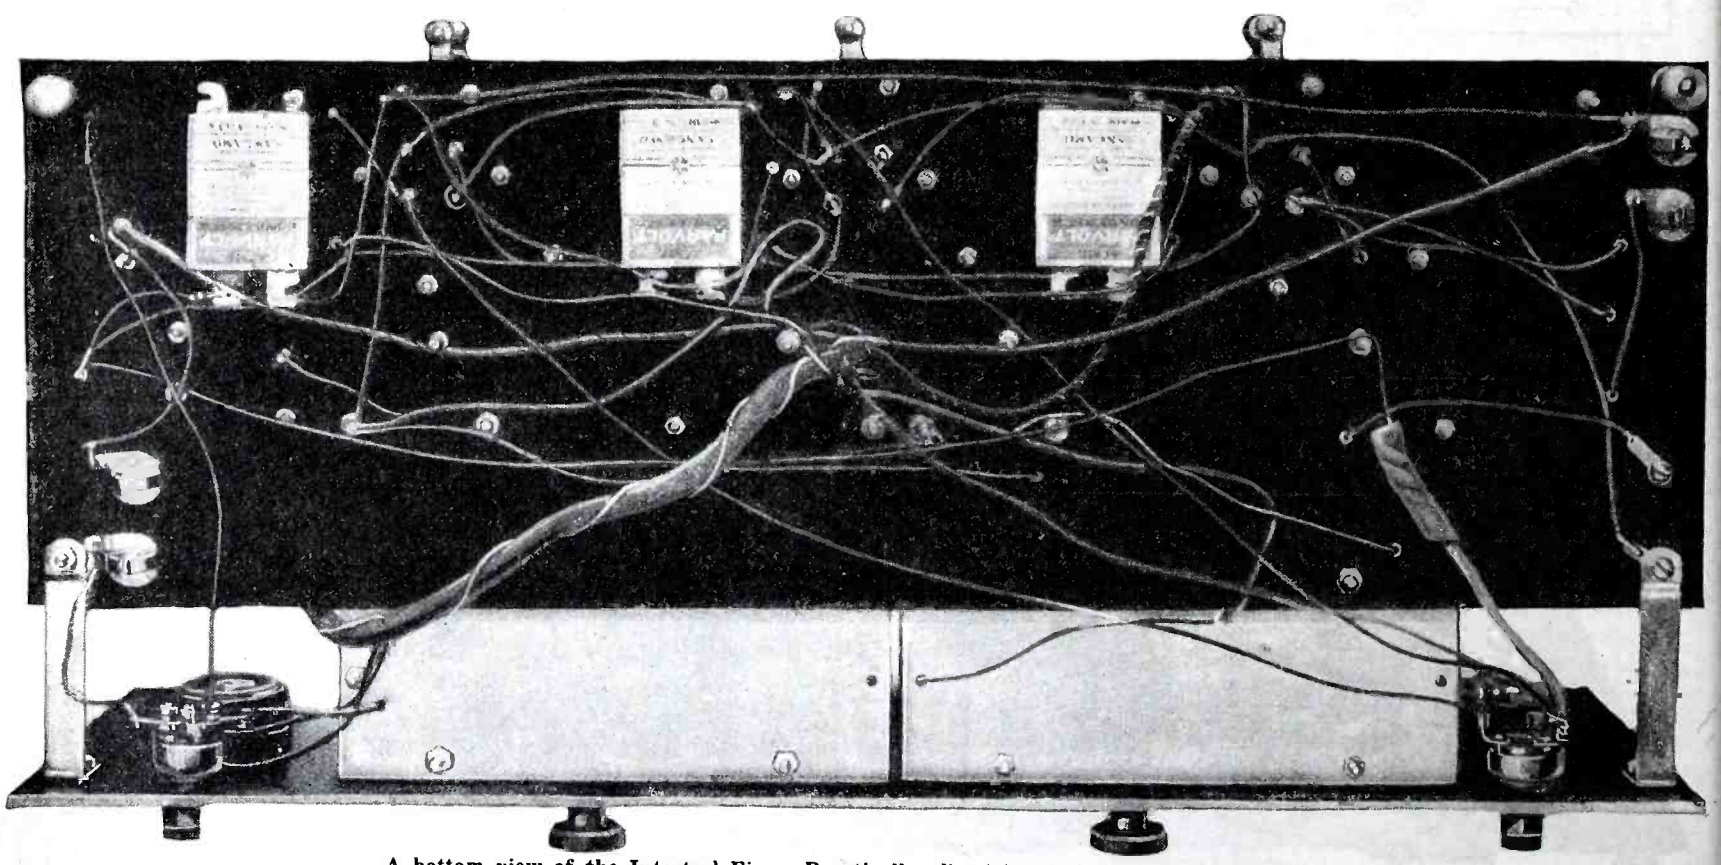
A number of interesting entertainments are available to the owner of an Intertrol Five, through the use of the switch (SW_2) provided for attaching the electric phonograph pick-up. If an earpiece is connected to a long extension cord and this in turn is plugged into the pick-up jacks (J, J_1) the earpiece may be used as a microphone and the voice of anyone talking into the earpiece will be greatly amplified and will be heard coming from the loud speaker, just as if the person were talking from the broadcasting studio. Reversing this process, the loudspeaker should be plugged into the pick-up jacks and the extension cord should be connected to the jacks provided for the loudspeaker. In this case, the voices of persons talking in the same room with the loudspeaker, will be clearly audible in the earpiece or headset, located at any remote point. This device will be found superior to most expensive commercial detective outfits.



Instrument layout of the receiver showing the location of all parts.

The first step in constructing the receiver is to attach the bottom and front shields to the sub-panel. The height of the front shield is 6½" and this determines the distance from the top of the sub-panel to the top edge of the panel. The shielding overlaps the front of the sub-panel by 2¼". In other words, the sub-panel sets back 2¼" from the panel. The next step is to locate the holes for the two variable condensers. In order to do this, measure off two parallel lines 7" from

(*Continued on page* 152)



A bottom view of the Intertrol Five. Practically all wiring is beneath the sub-panel.

The Light-Socket Operated World's Record Super Ten

IN the last isssue of RADIO LISTENERS' GUIDE AND CALL BOOK was described the latest development of Mr. E. H. Scott, designer of the World's Record Super Ten. This receiver was a distinct improvement over the original eight tube set with which Mr. Scott journeyed to Australia for the purpose of making long distance receiving tests. The establishment of four world's records for consistent distance reception was made as well as a resulting log of over seventy closely written pages covering the reception of American and foreign stations in Australia. The log that was later verified stands today as a proof of the truly remarkable performance of the World's Record Super receiver.

The New Improved World's Record Super Ten described in RADIO LISTENERS' GUIDE AND CALL BOOK was practically Mr. Scott's original eight tube set with two stages of preceding short wave tuned radio frequency amplification added, with the result that the sensitivity of the receiver was tremendously increased and its performance rendered truly marvelous. Many hundreds of these sets have been built since the publication of the last issue of this magazine, and some truly phenomenal reception reports have been received from builders. At the same time, with the rapid development of A.C. tubes which have taken place in the last few months, many of these same builders have inquired concerning the possibilities of complete light socket operation of the World's Record Super Ten, and it is in answer to these requests that this article is presented describing the completely light-socket operated model of the New World's Record Super Ten.

In order to obtain the most satisfactory and efficient power supply equipment and A.C. tubes for his receiver, Mr. Scott consulted with the engineering departments of two well known manufacturers, with the result that the Light-Socket Operated World's Record Super, employing A.C. tubes with all ABC power furnished by a specially designed unit, will give performance exactly on a par, if not slightly superior, to that obtainable from the regular battery operated model of the set, and with practically no trace of hum, or any other objections which might be raised against AC tubes as a result of lack of experience with these truly epoch making developments.

The Light-Socket Operated World's Record Super is substantially the same receiver as the battery operated model, and, in fact, any of the battery operated models may be easily converted to complete light socket operation by slight wiring changes with the addition of A.C. tubes of the type used and the World's Record Super Ten Power Pack described herewith. No detailed description of the World's Record receiver will be given as it can easily be obtained by a reference to page 91 of the Fall Edition of the RADIO LISTENERS' GUIDE AND CALL BOOK. Instead, this article will be confined to a description of those changes from the original circuit necessary to convert it to complete light socket operation.

A reference to the schematic diagram will indicate that it has actually been somewhat simplified, compared to that of the battery operated model. The grid and plate leads from transformers to tube sockets of the receiver remain the same as in the original set, the only changes being in the filament wiring and the grid and plate returns, or low potential wiring. The Sovereign A.C. tubes are actually four-element tubes comprising a heater coil connected to two leads at the top of each tube, this heater being inside the

PARTS REQUIRED FOR SET

1 Formica panel, 26 x 7 x 3/16"
1 Formica sub-panel, 25 x 10 x 3/16"
1 Remler 3 in line condenser No. 633 .00035 mfd. (C_1, C_3, C_4)
1 Remler condenser No. 638 .00035 mfd. (C_{11})
2 Remler drum dials No. 110 (1 each 110 & 110-R)
2 Remler R.F. Choke Coils No. 35 (R.F.C.)
2 Thordarson audio transformers R200 (T_1, T_2)
1 Thordarson output transformer No. 76 (T_3)
2 Selectone L.W. transformers No. B500 (L_4, L_6)
2 Selectone L.W. transformers No. B510 (L_5, L_7)
2 Selectone R.F. transformers No. 520 (L_2, L_3)
1 Selectone antenna coupler No. 530 (L_1)
1 Selectone oscillator coupler No. 540 (L)
1 Silver-Marshall 340 midget condenser (C_2)
1 Ward-Leonard 5000 ohm resistor (R_4)
10 Benjamin sockets (without bases)
1 Pair Benjamin brackets No. 8629

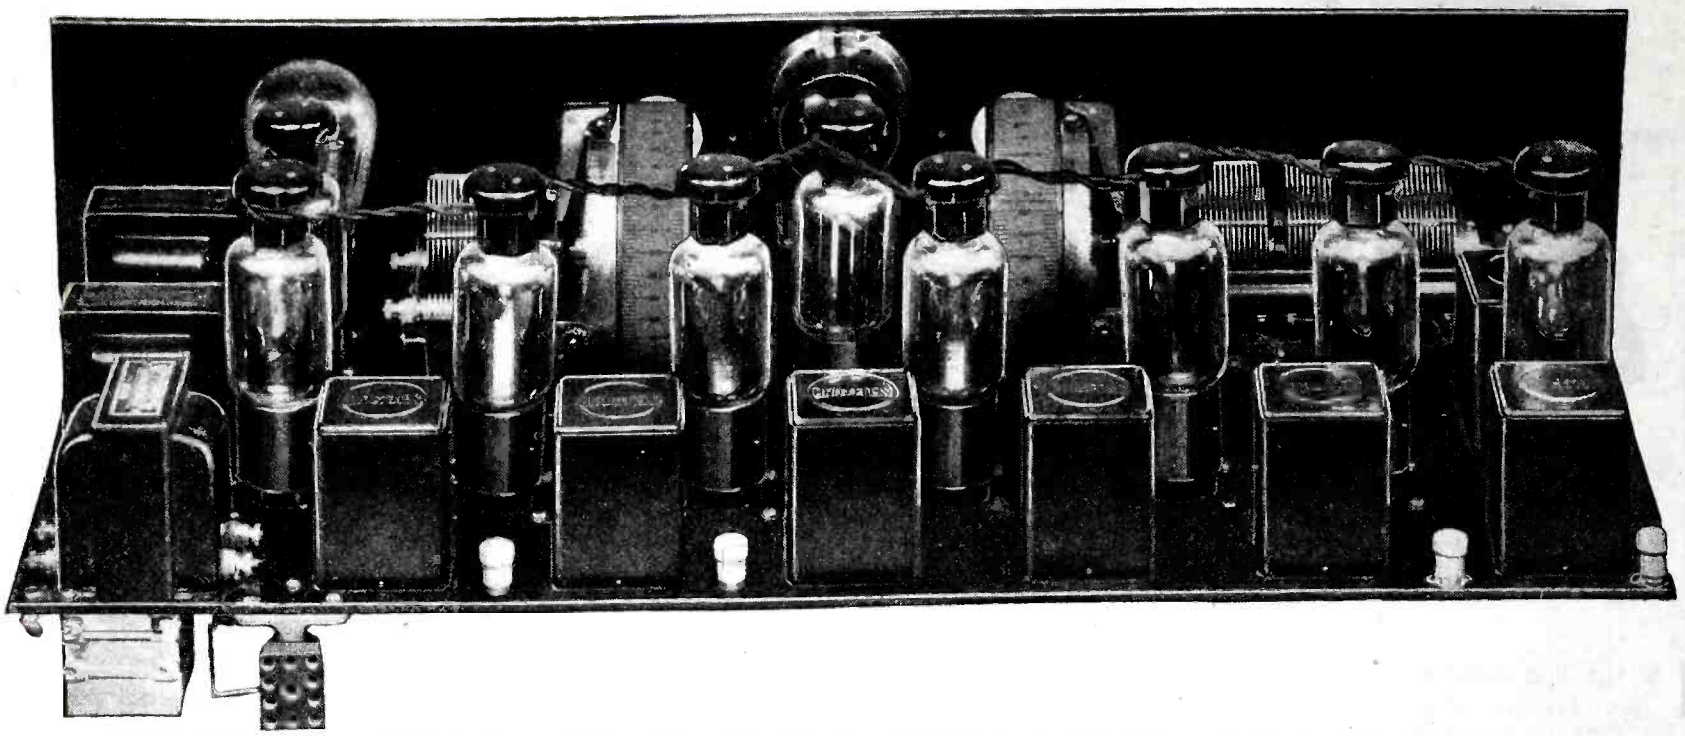
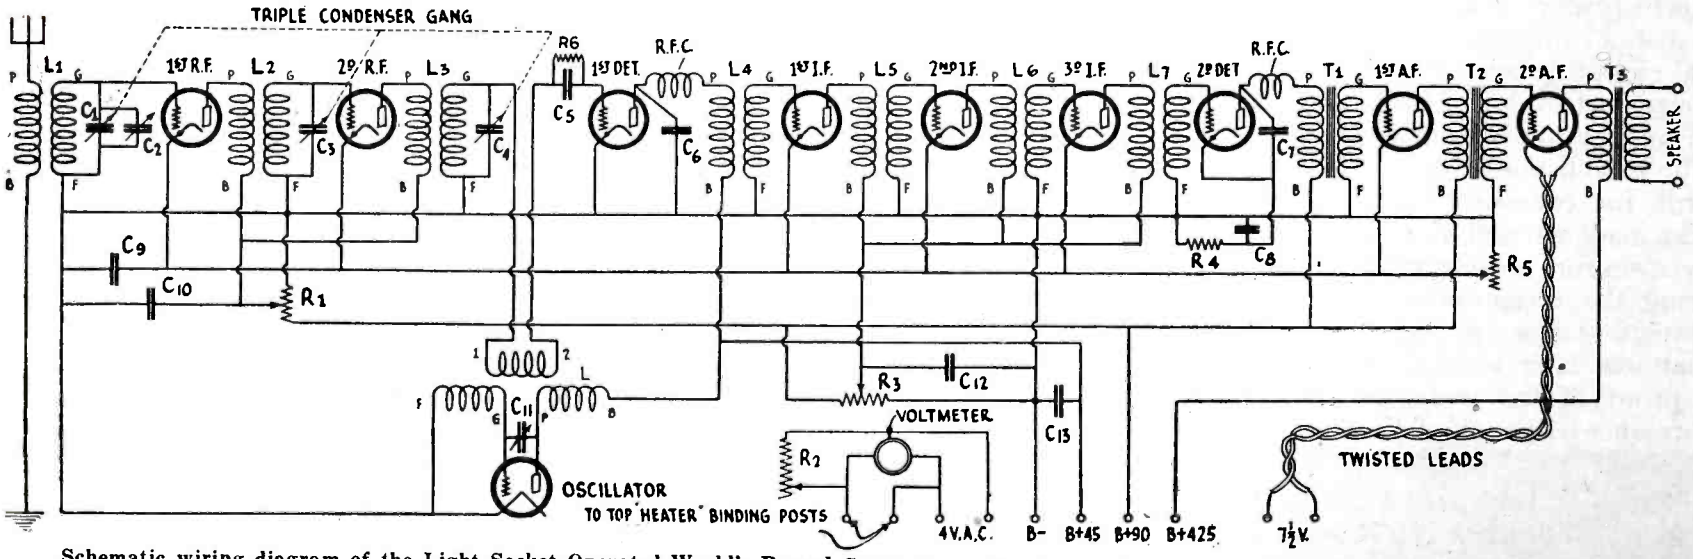
1 Carter fixed condenser, .0001 mfd. (C_8)
2 Carter fixed condensers, .002 mfd. (C_6, C_7)
1 Pair No. 10 Carter pin jacks
2 X-L binding posts
1 Jewell A.C. voltmeter 0-8 volts
9 Sovereign A. C. tubes
1 CX310 Amplifier tube
4 Tobe by-pass condensers, 1 mfd. (C_9, C_{10}, C_{12}, C_{13})
1 Tobe grid leak, 3 meg. (R_6)
1 Jones 10 contact multi-plug
1 Excello console Style R-31
40 Soldering lugs and Kester radio solder, Acme hook-up wire, etc.

second element which is a metal sleeve coated with an electron emitting oxide. This second element is connected to the negative filament pin of the tube base (the positive pin is dead) and it high mutual conductance, low plate impedance and low inter-electrode capacity.

In operation, raw A.C. at 3 volts is fed directly to the top binding posts regular receiver circuits proper and consequently the set operates with practically no trace of A.C. hum—less than is obtained with the average B eliminator.



A rear view of the completed A. C. operated receiver with the nine Sovereign A. C. tubes and power tube in their relative sockets.



Schematic wiring diagram of the Light Socket Operated World's Record Super Ten. Twisted leads connect to the two binding posts indicated below the voltmeter and run to the top "heater" terminals of all Sovereign A. C. tubes.

takes the place of the filament or emitter in an ordinary battery operated vacuum tube. The remaining elements, the conventional grid and plate are so of each tube connecting with the heater element, which, in turn, indirectly heats the oxide coated sleeve which serves as a filament. Thus the actual

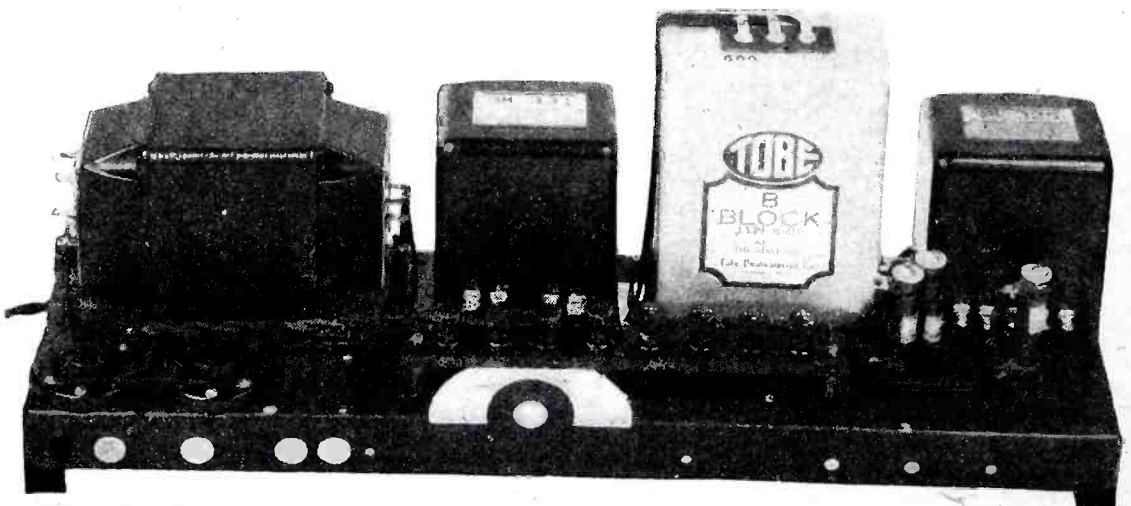


Photo showing the assembly of the power unit designed especially for use with the A. C. World's Record Super Ten.

disposed in this type of tube as to result in a high amplification constant, raw A.C. circuit is entirely isolated from and in no way connected to the

In order to employ Sovereign tubes, the method of volume and oscillation control on the short wave and intermediate radio frequency amplifiers had to be changed. It is necessary with A.C. tubes to operate them with a slightly negative grid for best results, and a 400 ohm potentiometer used as a rheostat provides a variable voltage drop serving to bias the grids of all R.F. and the first stage A.F. amplifier tube of the receiver. Oscillation is then controlled in the two R.F. amplifiers by means of a new method. This method consists of shunting the B+90 circuit with a 5,000 or 6,000 ohm wirewound potentiometer, the R.F. amplifier plate returns connecting to the arm of the potentiometer which thus allows their plate voltage to be varied from zero to the full value of 90 volts. At the same time, the grid voltage automatically adjusts itself for each change in plate voltage. This method is ex-

tremely satisfactory and is one of the few methods of oscillation control satisfactorily adapted to A.C. tubes. Two potentiometers are employed, one for the short wave R.F. amplifier and one for the intermediate amplifier. All grid returns eventually terminate in the heater sleeve of the AC tubes serving as a filament, these connections being made to the minus terminals of the various tube sockets, the positive filament terminals being left dead.

THE PARTS FOR THE POWER UNIT

1 S-M 328 power transformer
1 S-M 325 A supply transformer
1 S-M 331 Unichoke filter system
1 Van Doorn Unipac chassis and cabinet with hardware
1 Tobe R-210 condenser block
1 Ward-Leonard 7200 ohm resistor
1 Ward-Leonard 2250 ohm resistor
1 Ward-Leonard 5000 ohm resistor
1 Ward-Leonard 1500 ohm resistor
1 Frost FT64 balancing resistor
2 S-M 511 tube sockets
8 Eby binding posts (4 plain, B—, +45, +90, +AMP.)

All condenser values in the light-socket operated receiver are the same as those in the battery operated model. However, the filament circuit is somewhat different, the power for the operation of the A.C. tube heaters being obtained from a 4 volt filament lighting transformer source in the power unit. This 4 volts at 9 amperes is brought to the heater tube filaments through a Multi-Plug and cable with a 1/5 ohm rheostat used in the receiver to adjust the heater voltage to between

2.75 and 3 volts—the best operating value. An A.C. voltmeter is used to determine this voltage definitely. The front and sub-panel arrangements of the light-socket operated World's Rec-

mounted the 1/5 ohm rheostat and the 400 ohm grid voltage resistance.

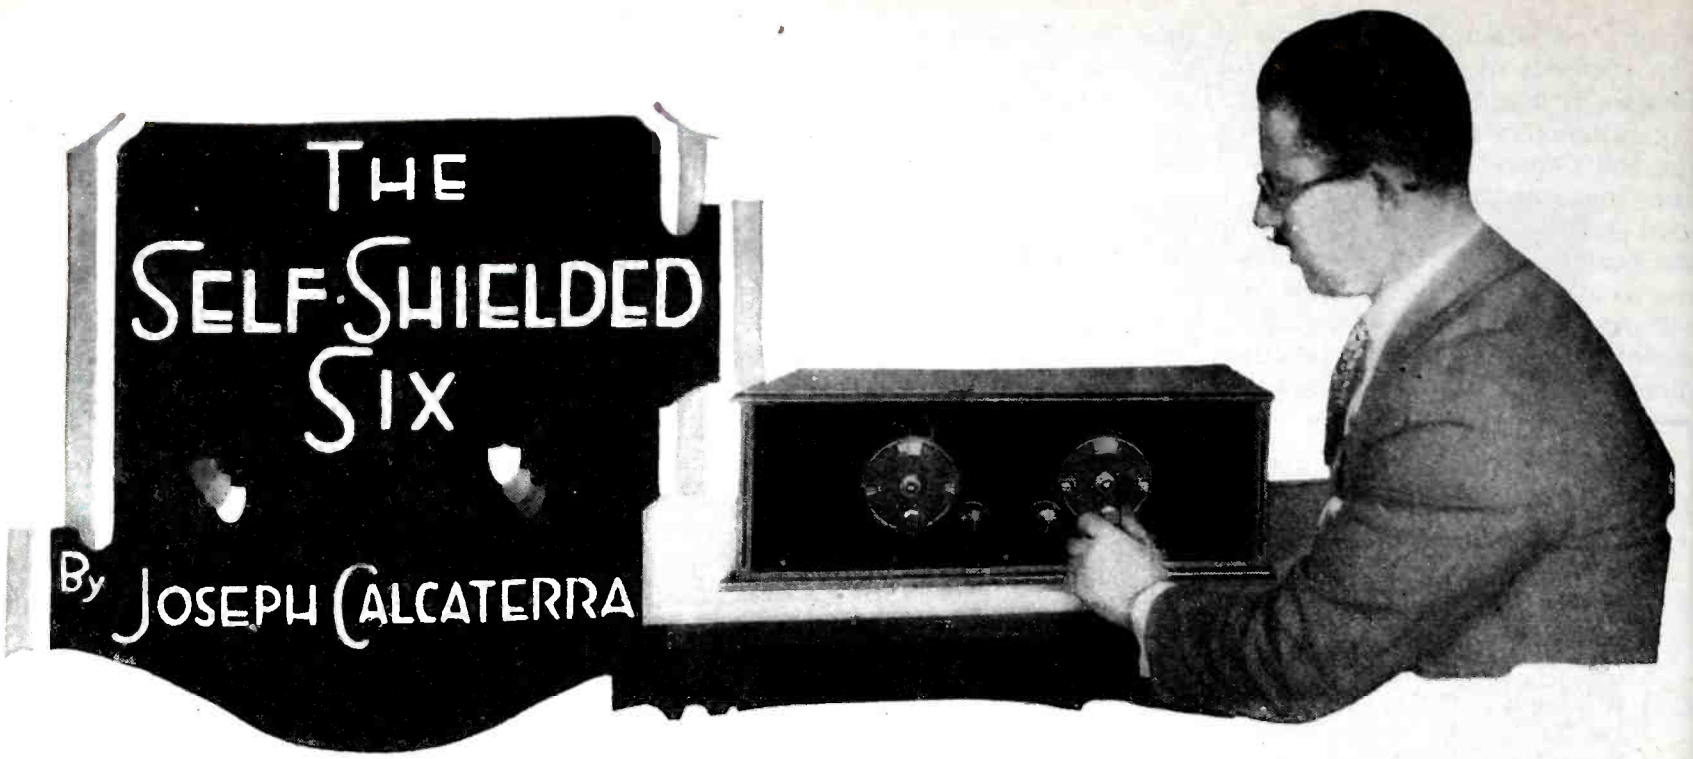
The power supply for the receiver is an extremely interesting unit, for it converts regular 60 cycle, 110 volt, al-

tubes and 7.5 volts on their filaments. The output of these tubes is filtered by a special choke combining a selective and brute-force action operating in

(*Continued on page* 158)

THE SELF-SHIELDED SIX

By JOSEPH CALCATERRA



WE are often inclined to be carried away with something new, though it may have little if any advantage over what we have been used to. In radio receivers, for instance, shielding is being resorted to on every hand. to reduce the interaction between stages in radio-frequency amplifiers. Often this shielding adds much to the price of the receiver, complicates the construction, and like as not adds nothing of value to the receiver.

Much of the shielding used today is ineffective. In many receivers the shielding could be removed entirely without any noticeable effect on the stability of the R. F. amplifier; and perhaps even with noticeable improvement in efficiency. If shielding is worth doing at all it is worth doing well, which usually means specially designed shields, metal panel and subpanel, etc.

It is a strange fact that a metal box that appears to be absolutely tight will not completely shield a coil placed within it. This is proven by the fact that in some of the most expensive commercial receivers it has been found necessary to inclose one shield within another, or in other words, provide a complete double shield. In high grade loop receivers for instance, the detector circuit is usually inclosed in such a double shield because a single shield is not sufficient to prevent some of the energy of the detector circuit feeding back to the loop and thus causing oscillation.

An interesting illustration of the ability of radio-frequency waves to get through microscopic openings is to be observed in the laboratories of a large radio manufacturer in the middle west. There a small room is built entirely of metal; the walls, ceiling and floor being of double, spaced layers of galvanized iron. There is a double metal door and this door closes like the door of an icebox or a safe. That is, after the door is swung shut, it is pulled up tight into its frame by means of a lever and bolt arrangement. By pulling the door up tight in this manner the room is absolutely sealed and is without openings or cracks of any kind.

PARTS REQUIRED

- 3 Bodine Twin-Eight R. F. transformers, T1, T2, T3.
- 1 Hammarlund No. ML-17, .00035 mfd. variable condenser, C1.
- 1 Hammarlund No. MLD-17 dual Midline variable condenser, .00035 mfd. each half, C2, C3.
- 1 Dubilier Type 640, .00025 mfd. fixed condenser with grid leak clips, C4.
- 1 Dubilier Type 601, .001 mfd. fixed condenser, C5.
- 1 Dubilier Type 907, .5 mfd. by-pass condenser, C6.
- 1 Harkness R. F. choke, CH.
- 2 Carter No. 10 tip jacks, J1, J2.
- 1 Harkness output filter unit, OF.
- 1 Carter No. M-10-S, combination 10 ohm rheostat and filament switch, R1 (S).
- 1 Lynch Type 4 Equalizor, automatic filament control resistor, R2.
- 1 Lynch Type 1 Equalizor, automatic filament control resistor, R3.
- 1 X-L Type G5 Vario-Denser, C7.
- 2 Lynch 900 ohm Suppressors, R6, R7.
- 1 Universal Clarostat, R4.
- 1 Lynch 2 megohm Metallized grid resistor, R5.
- 3 Harkness tuned double impedance couplers (1st, 2nd and 3rd stage types) T4, T5, T6.

- 1 package Kester radio solder.

During the demonstration a sensitive receiver operating with a loop antenna was in operation within this room. With the door standing open station KDKA at Pittsburgh, several hundred miles distant, was tuned in with good volume. Then the door was gradually swung shut, with a marked decrease in signal strength but when the door was as tight as it could be pulled by hand *KDKA could still be heard.*. The door was so tight that not a ray of light could be seen anywhere around it but the radio waves were nevertheless coming through the infinitesimal cracks. Then the mechanical lever-bolts were slowly thrown. These pressed the door into its frame with a pressure of several hundred pounds and made it absolutely tight. When the bolts were shot all the way the radio waves were finally and completely foiled—*but not until then.*

If an invisible crack will admit radio waves from a station several hundred miles distant it becomes pretty evident that a good deal of today's shielding is not worth its salt so far as its shielding effect is concerned. In many instances where the use of shielding seems to have a stabilizing effect on an amplifier the stability results from the losses introduced as a result of the close proximity of the metal to the coils, rather than from any decided shielding effect.

The real aim of this article is not to "unsell" anyone on the shielding idea but simply to bring out the fact that shielding, unless properly done, might better be omitted. Proper shielding is unquestionably a fine thing and efficient four stage R. F. amplifiers such as we know today would be impossible without it.

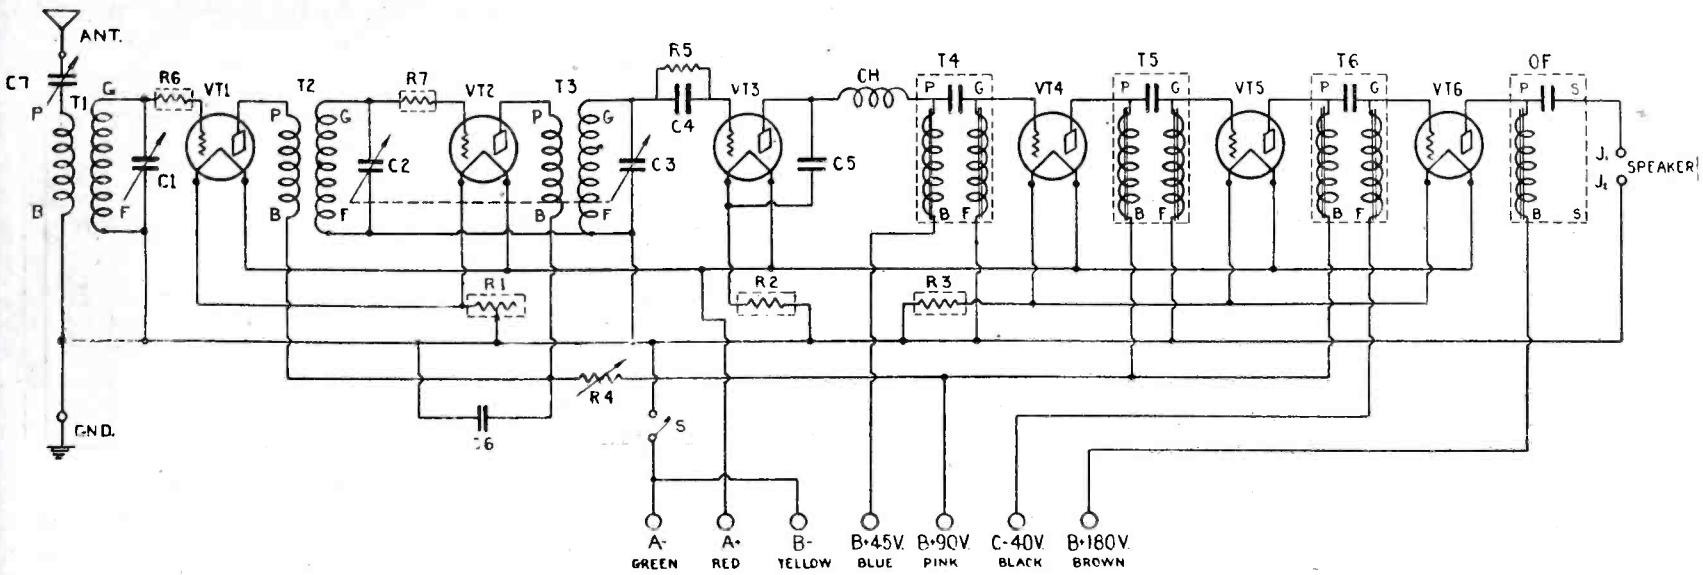
The Self-Shielded Six receiver is so called because of the inherent self-shielding properties of the coils themselves. A properly constructed coil of the "twin eight" type will have practically no stray field of its own nor will it pick up strays from associated

circuits; it isolates itself more effectively than would a slip-shod job of metal shielding. Which is another way of saying that interaction between stages of a R. F. amplifier is much decreased by the use of this type of coils.

"twin eight" coil at the same time and to an equal degree. The pick-up of one section will therefore counter-act the pick-up of the other with the result that the effective stray pick-up is reduced to practically zero.

construction of this receiver is much simplified, as is also the adjustment of the circuit. In fact this new receiver requires no preliminary adjustment of any kind.

The Self-Shielded Six receiver em-

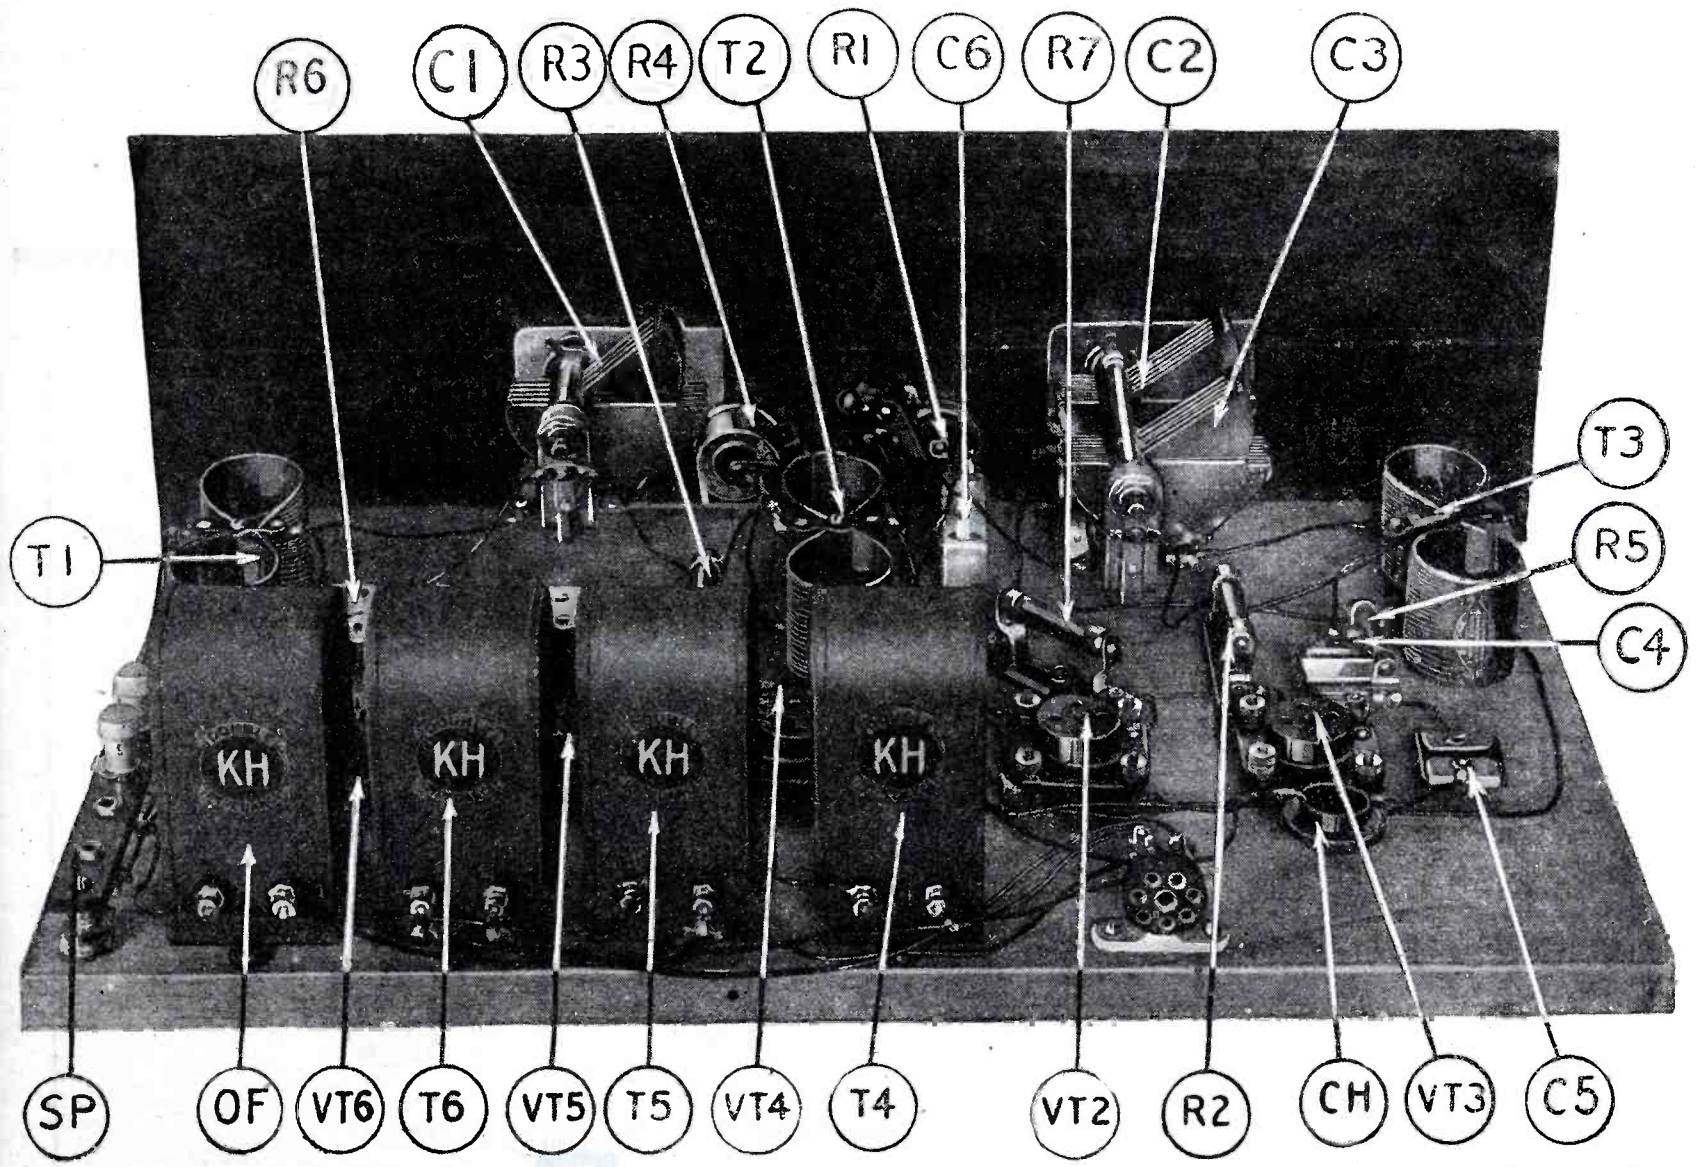


Schematic wiring diagram of the receiver. The units T4, T5 and T6 are the special double impedance couplers while OF is the output filter choke. R4 is a universal range Clarostat variable resistance employed as a volume control.

The limited field is due to the tendency of the lines of force to pass directly from one coil into the other and thus set up a circular field which is

By using Bodine Twin Eight coils, and spacing them far apart this circuit presents a degree of stability seldom attained in a two stage radio-

ploys two stages of tuned, radio-frequency amplification, detector and three stages of double impedance coupled audio-frequency amplification.



A view of the set behind the front panel. All parts are indicated with letters and numerals which correspond with those on the schematic and picture diagrams. Batteries are connected by means of the multi-plug on the rear of baseboard.

practically limited to the dimensions of the coil unit.

Stray pick-up is made practically impossible by the fact that the stray will be impressed on both sections of the

frequency amplifier without neutralizing or balancing circuits of one kind or another even though it be partially shielded with metal. And by eliminating the necessity for such schemes, the

The circuit itself is standard and has no claim to novelty. It was the intention of the designers, not to create a new circuit, but rather to take a reliable standard and make the most of

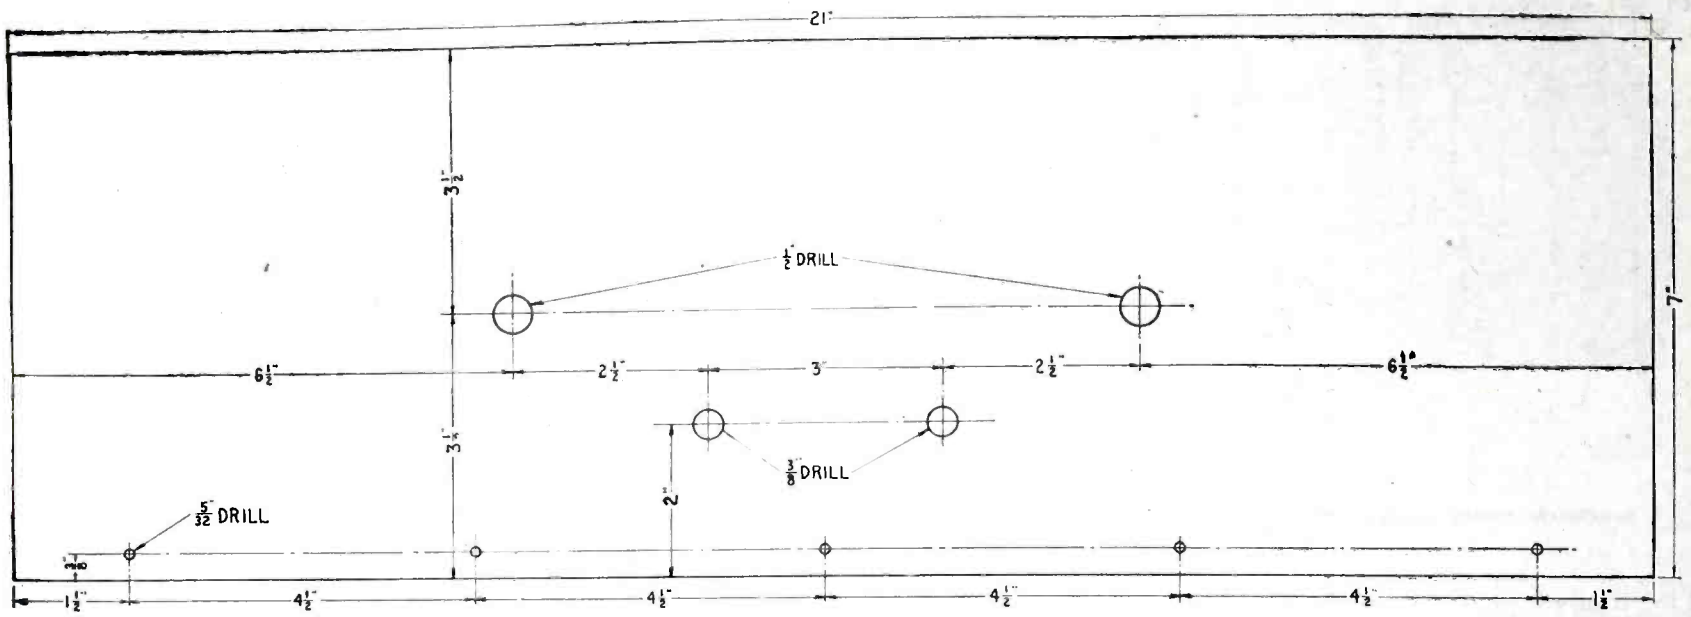
it by carefully selecting all of component parts.

High efficiency, stability without critical adjustments for neutralizing or balancing, ease of construction, ease of operation, fine volume and tone quality were the aims of the designers and

antenna circuit. Ordinarily a fixed condenser is used here in order to compensate for large antennas but such an arrangement has the disadvantage that if the builder happens to have a small antenna he will find his reception very weak. The semi-variable condenser

quires no further attention unless some change is made in the antenna.

The coils have already been discussed in some detail above so it will not be necessary to expand further on them here. The variable condensers require little to be said for them be-

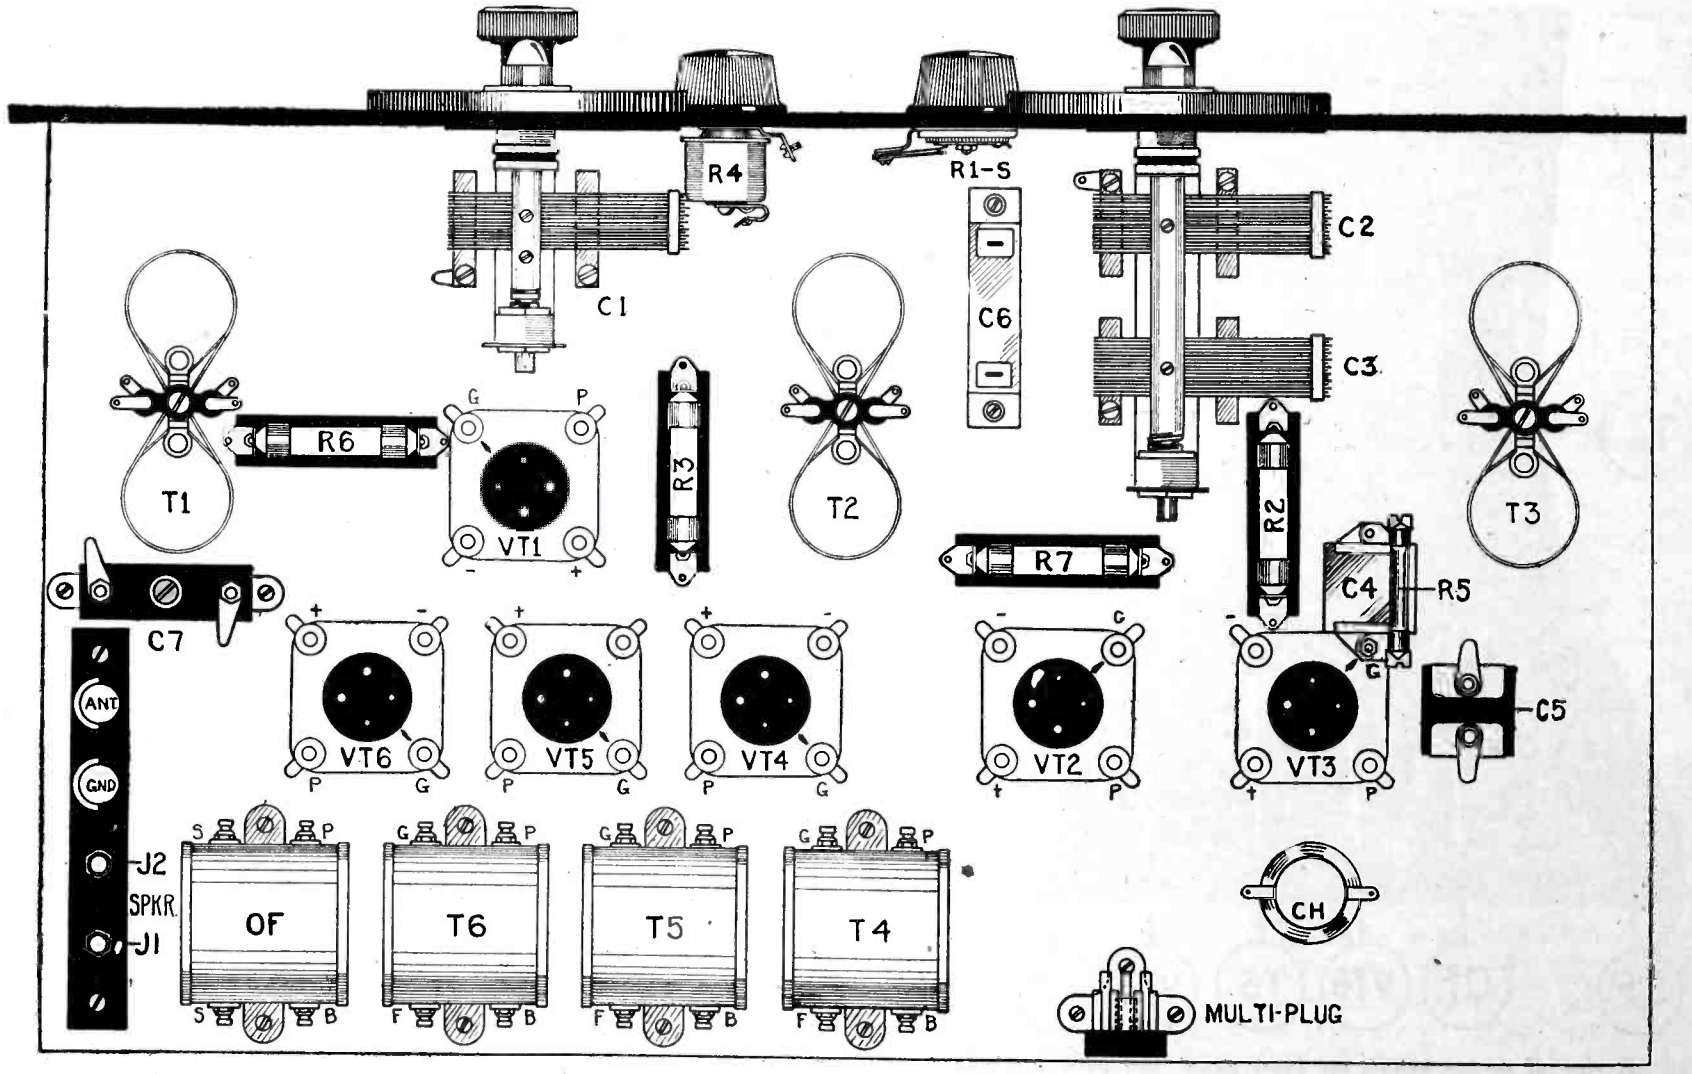


Dimensions for drilling the front panel of the set. The double variable condenser, C2 and C3 is mounted at the left of the panel while the single condenser C1 is mounted at the right.

their efforts have met with an unusual degree of success in this receiver. It seems to have all of the features one could desire in a home receiver and

used in this receiver has a capacity range between .0001 and .0005 mfd. With a screw driver, its capacity can be varied to exactly adapt the receiver

cause of their generally recognized efficiency. C2 and C3 are built in a dual unit with a common frame but separate insulated stators. This per-



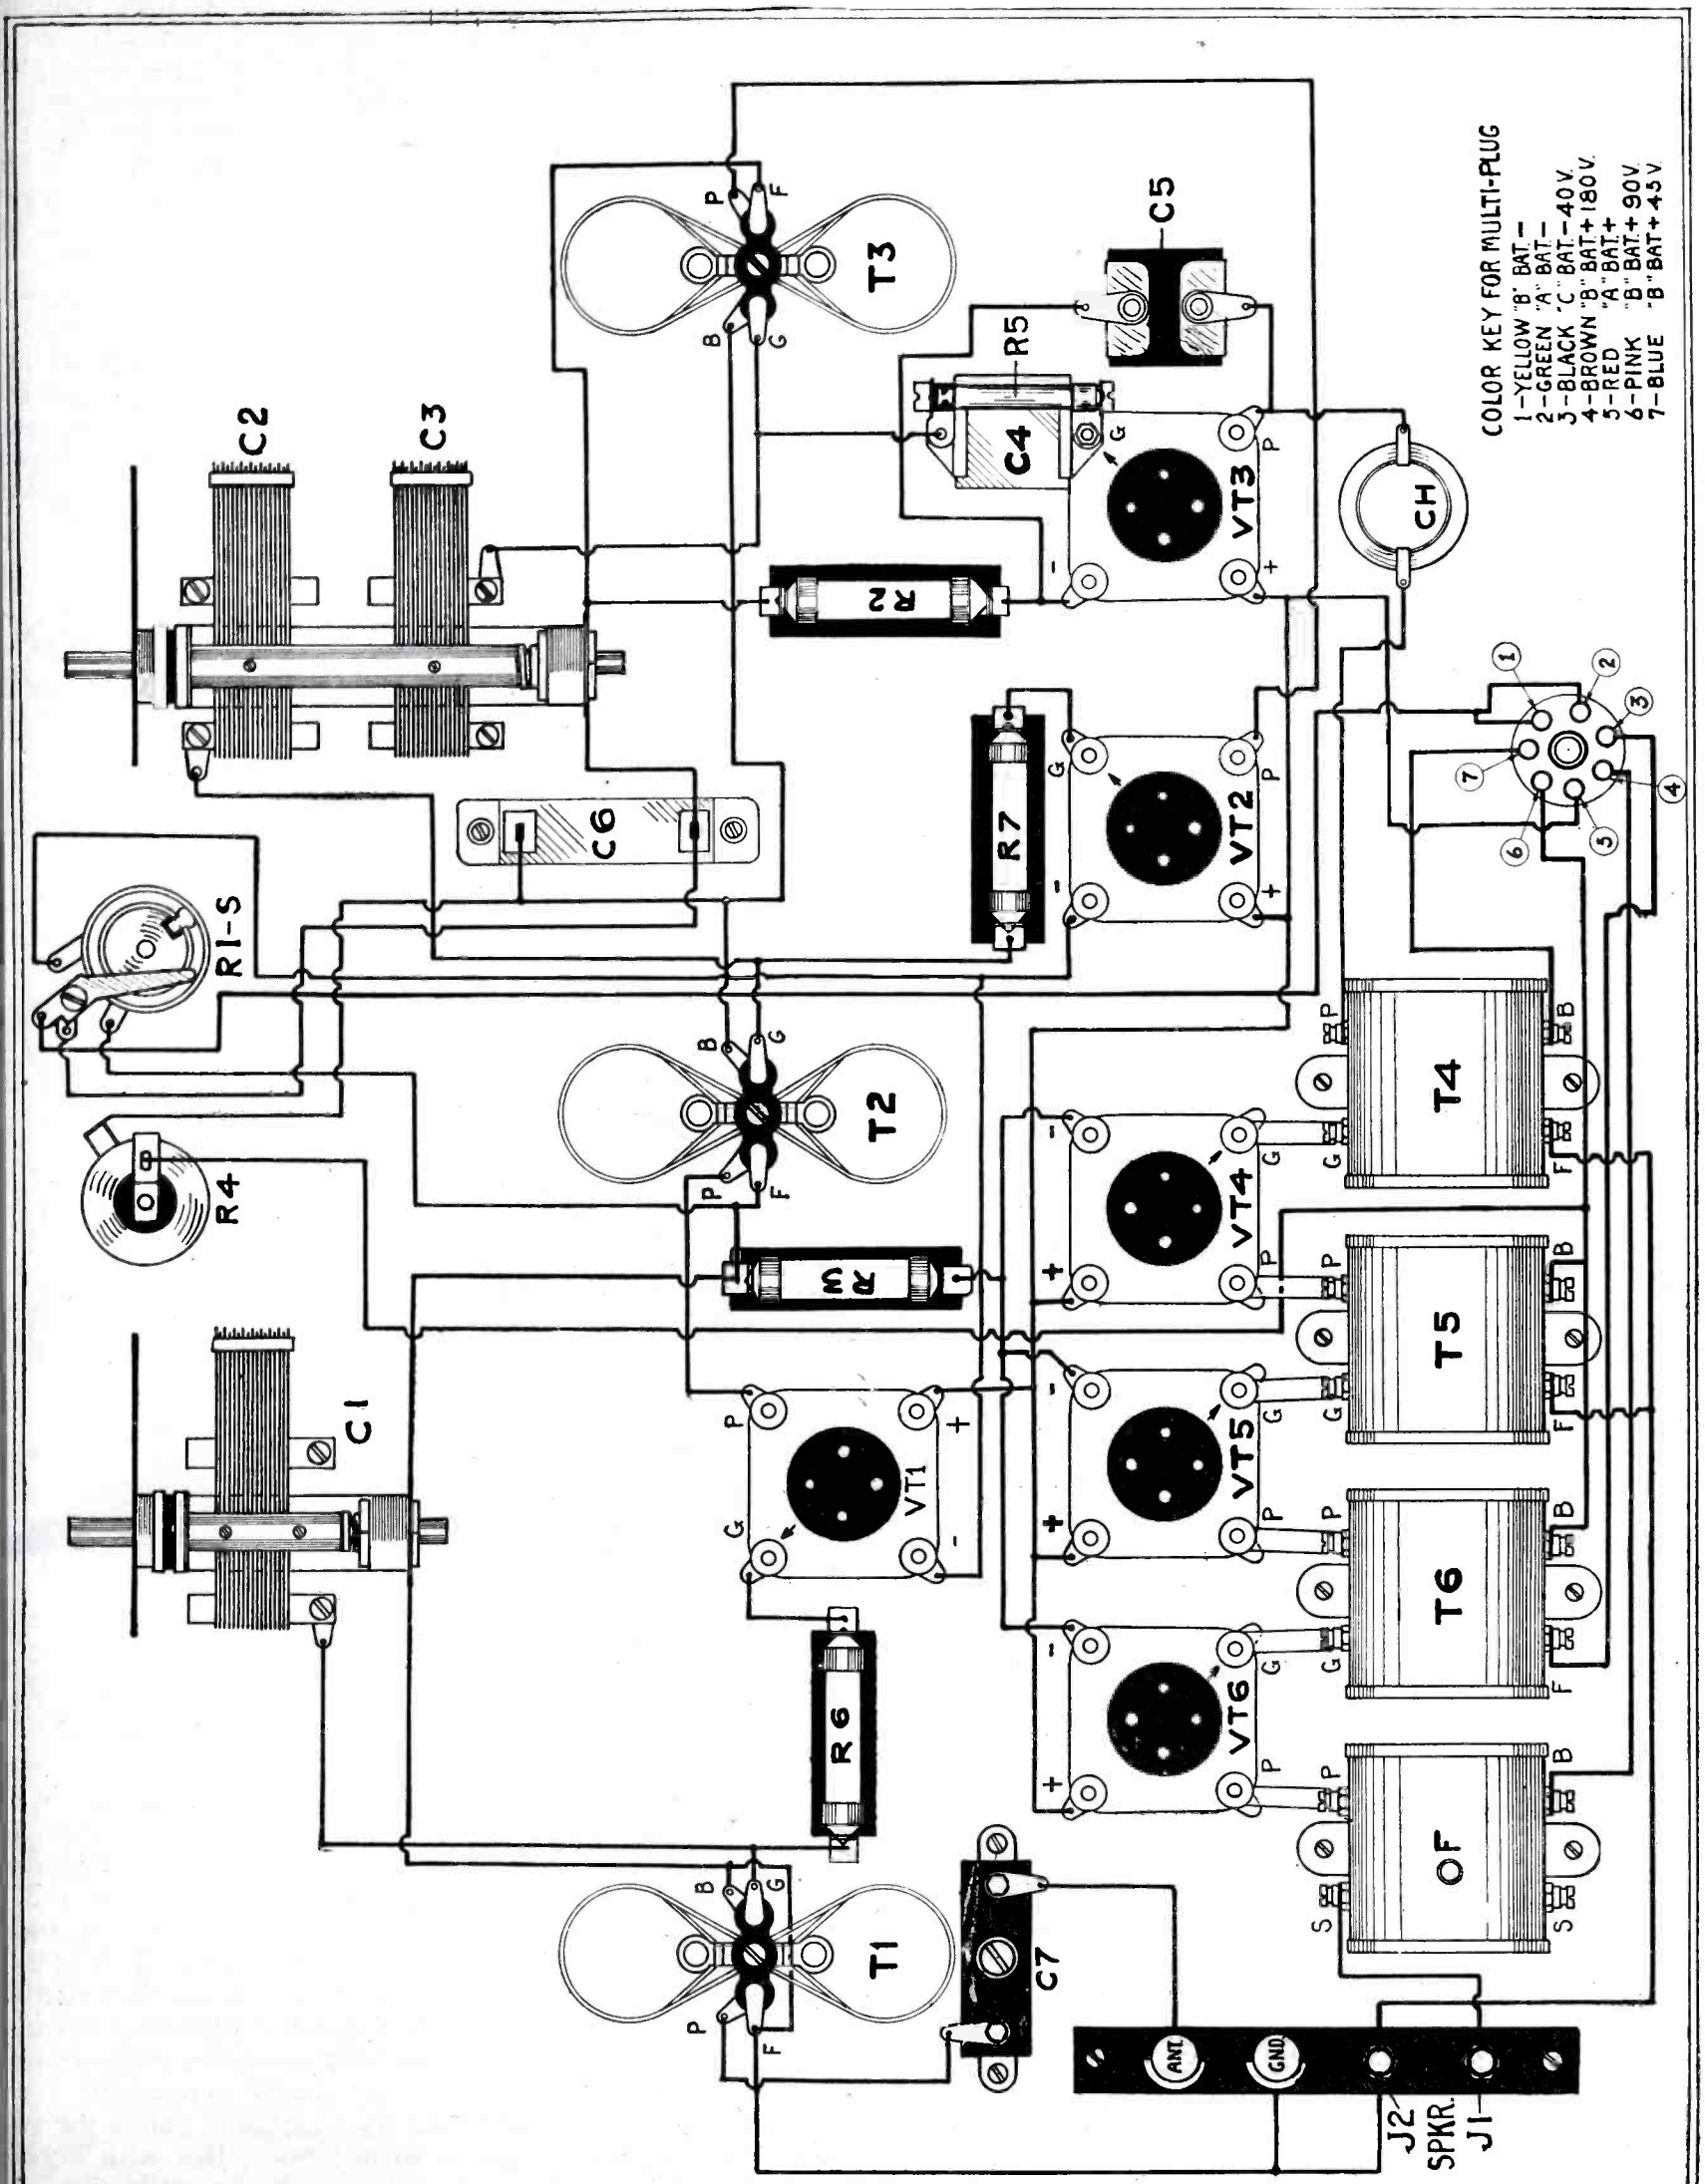
All parts are mounted on the front panel and baseboard in their relative positions as shown above.

still does not involve the complications and expense of shielding, or balancing.

To start with a small semi-variable condenser is included in series with the

to the antenna with which it is to be used. It is not a tuning control in any sense of the word because it is adjusted only once and thereafter re-

mits the control of the second R. F. and the detector stages with but a single tuning dial. The 1st R. F. stage is individually tuned in order to take



care of variations in circuit values resulting from different-sized antennas. This arrangement permits maximum efficiency in each tuned circuit, yet limits the tuning controls to two.

The filaments of the two R. F. tubes are controlled through the rheostat R1 which therefore functions as a volume control. For the latter reason this rheostat is mounted on the front panel to serve as one of the operating controls of the receiver.

A variable high resistance, R4, is also included in the "B" supply lead to the plates of the R. F. tubes. The purpose of this resistance is not so much to function as a sensitivity control but rather to provide close regulation of the current supplied to the plate circuits of these two tubes. This resistance is particularly useful where a "B" eliminator is used for the high voltage supply. If the eliminator has no variable control to regulate the voltage at the R. F. or intermediate tap, this office is performed by R4.

Two resistors, R6 and R7, are included in the grid circuits of the R. F. tubes. It will be noted that these are in series with the grids and are connected right next to the grids. The resistances are therefore not in the tuned circuits and do not alter the tuning characteristics of the circuits in any way. Their function is to prevent the flow of current in the grid circuits and thus avoid oscillation in the R. F. stages.

A word might be said here in defense of the use of these grid suppressors. There has been a feeling for a long time that the use of resistance in the grid circuit caused broad tuning. This is most certainly confirmed in cases where the resistance is placed directly in the tuned circuit which comprises the secondary coil and condenser. But if the resistance is connected between the tuned circuit and the grid the decrease in selectivity and the falling off in signal strength is so small that it cannot be noticed, if it exists at all.

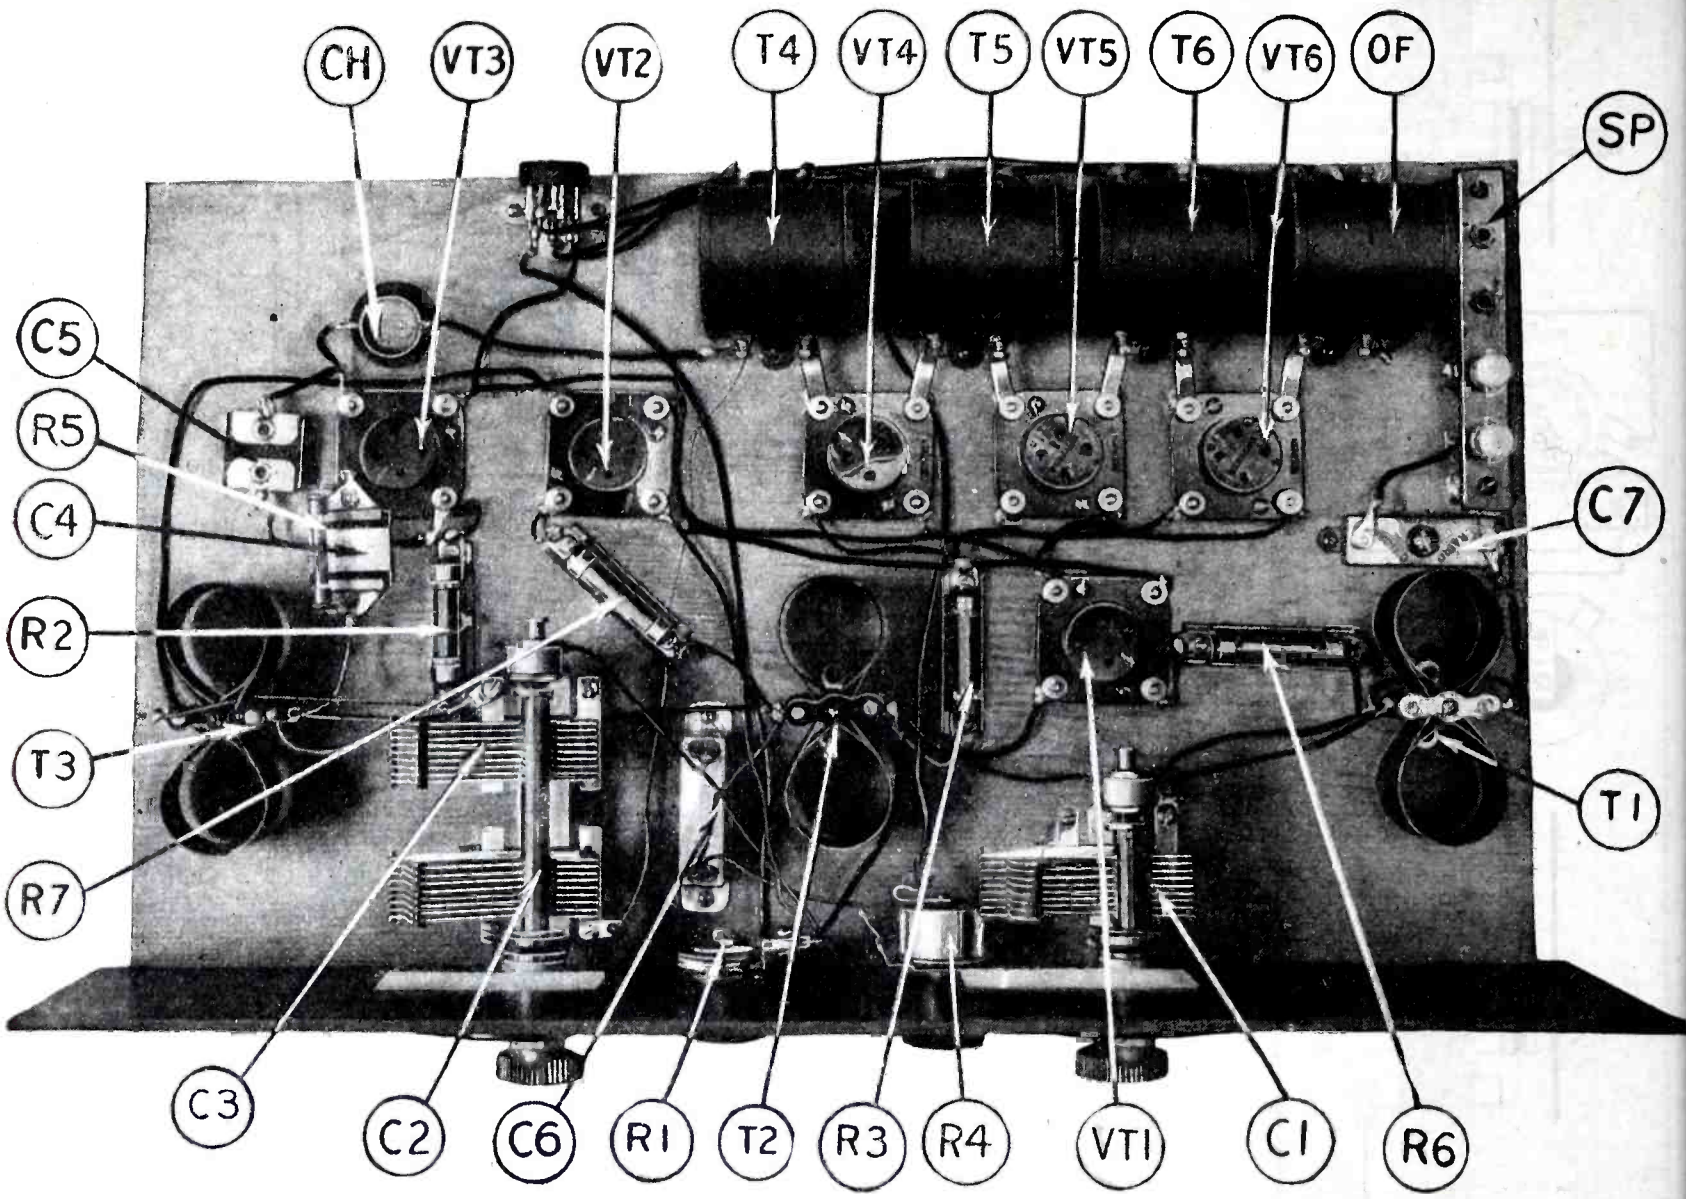
After much careful consideration the grid method of detection was decided upon as being the most practical; first, because of its greater sensitivity and second because it is believed that the distortion often credited to this detection method is a myth. In comparative tests made between grid and plate detection, the former came off with all the sensitivity honors and equalled the other in all standards of quality.

The choke coil CH and by-pass condenser C5 have been included in the plate circuit to provide a barrier to prevent the R. F. currents from passing on to the audio amplifier where they might cause distortion.

The audio amplifier is worthy of a little discussion. Transformer, resistance and single impedance coupling were all considered carefully before this double impedance type of coupling was selected. Every coupling has its advantages and disadvantages, but this double impedance scheme seems to include practically all of the best points of other types, but not their weaknesses.

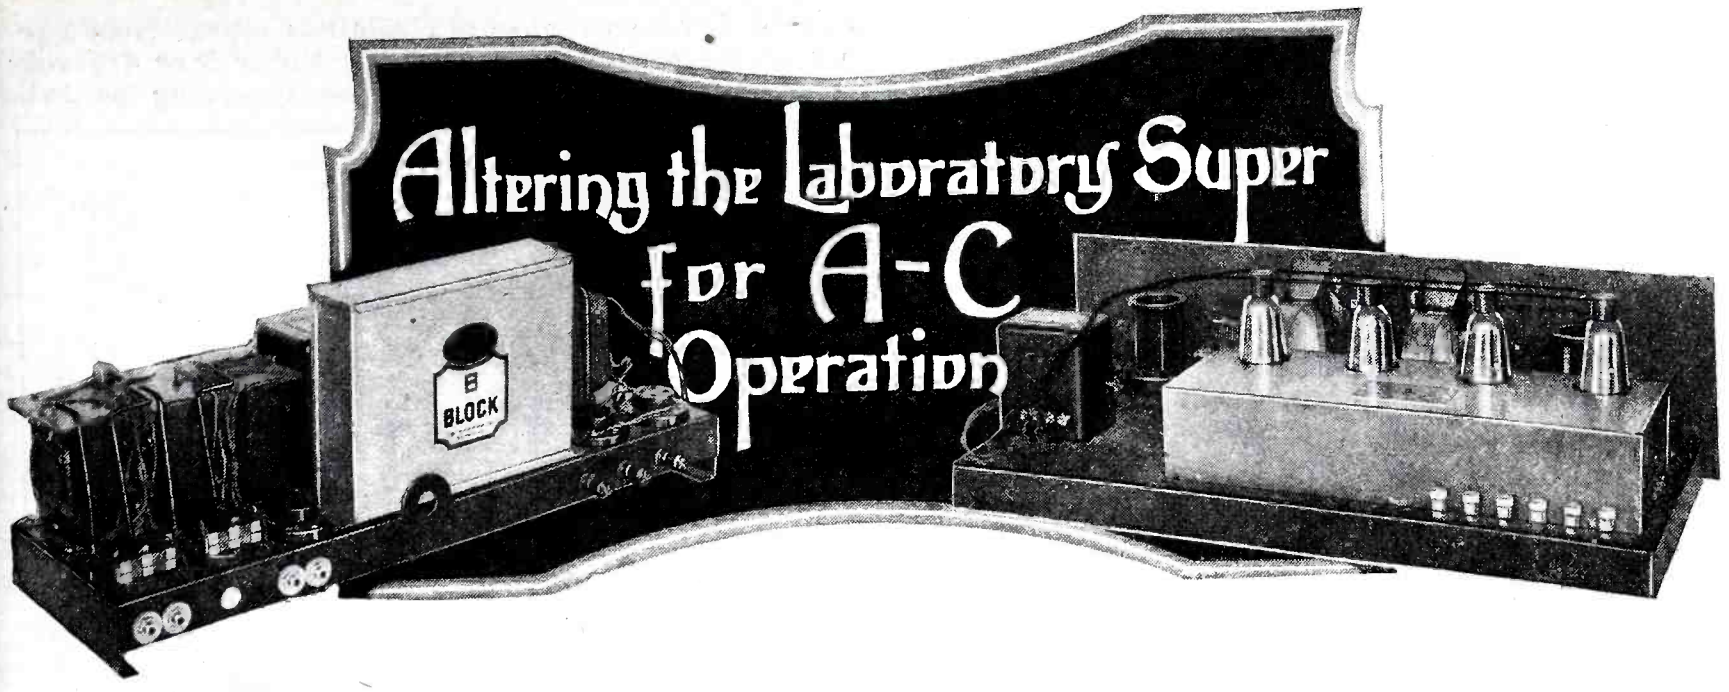
Overloading in the audio amplifier is probably the one greatest cause for distortion. At least this is true of high grade amplifiers. This is particularly true of resistance coupling as commonly used, and also of single impedance coupling. But with a good double impedance coupled amplifier it is possible to use a CX 301-A type of tube in the last audio stage without overloading it as readily as a 371 power tube would overload in some other types of amplifiers. This ability to withstand heavy loads without distortion is a decided advantage because almost without exception radio receivers overload badly on signals from powerful local stations, unless the volume is turned low. But with impedance coupling such as used in the Self-Shielded Six receiver the local stations can be enjoyed at full volume if desired, without overloading.

(*Continued on page* 154)



A top view of the Self-Shielded Six set. Regardless of appearance, the wiring is simply made in the most convenient manner. The completed set can be installed in a console and the general layout behind the front panel is not seen.

Altering the Laboratory Super for A-C Operation



SINCE describing constructional details on the Improved Laboratory Super-Heterodyne in the last edition of RADIO LISTENERS' GUIDE AND CALL BOOK, numerous requests have been received from our readers for information and data on converting this set into an A.C. operated receiver employing standard A.C. type tubes. We will therefore describe in the following how this set can be altered with the addition of the L.C. 28-Unipac.

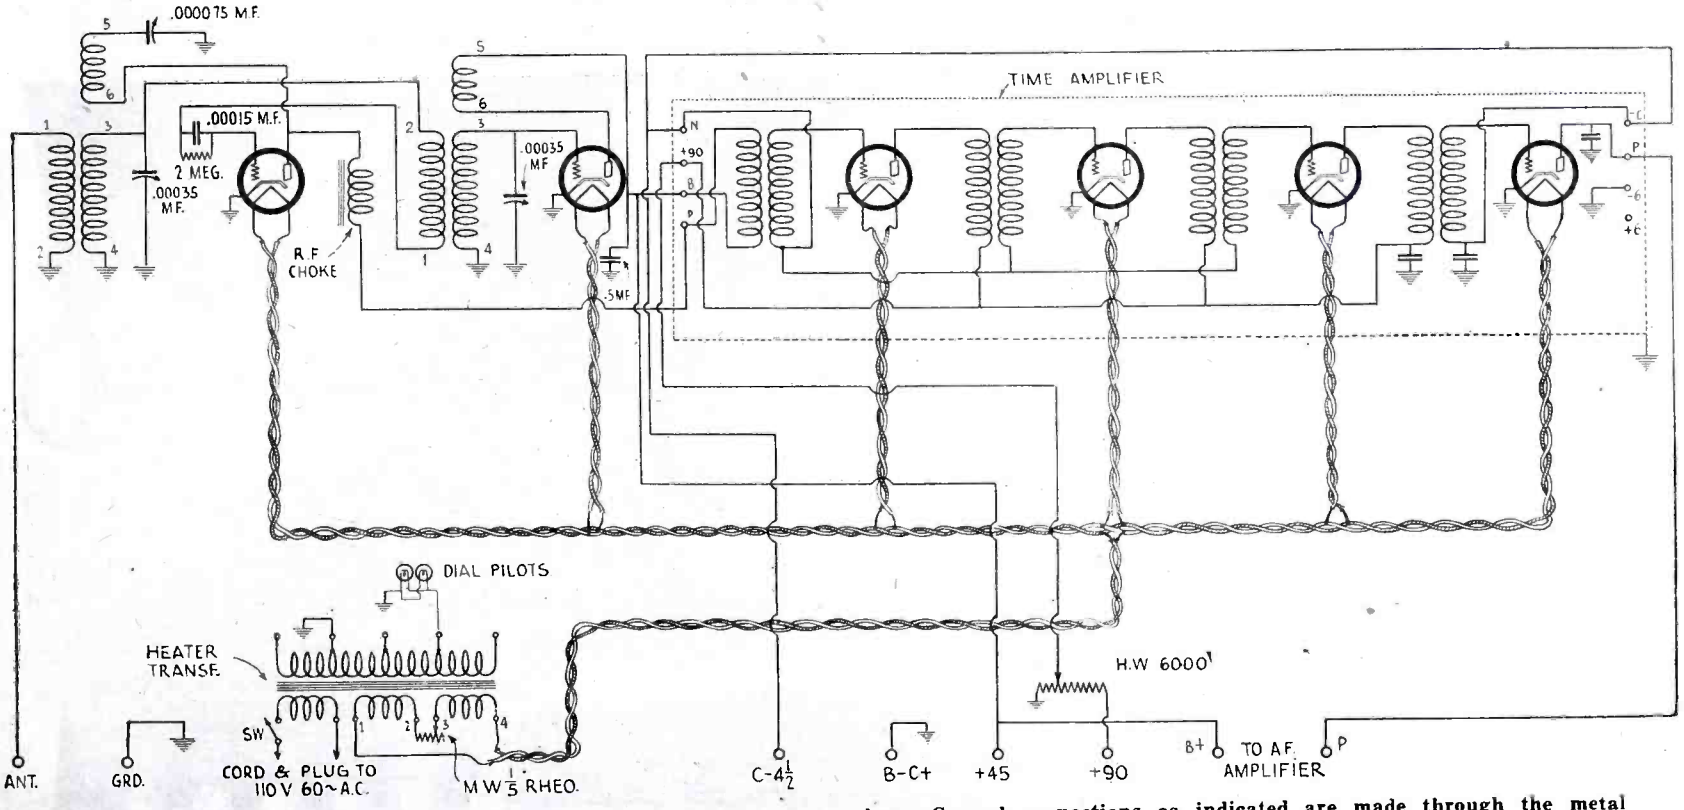
The actual construction of the receiver itself is practically identical with that of the original model, and the reader is referred to page 94 in the Fall edition of this publication.

The arrangement of parts remain almost the same with the exception of removing the two audio transformers and two tube sockets, as the audio amplifier is provided in the L.C.-28 Unipac unit. A Silver-Marshall No. 325 heater transformer is then mounted in the same location formerly occupied by the second audio transformer as shown in the accompanying photo of a rear panel view of the set. The complete circuit changes are shown in the accompanying schematic diagram.

PARTS REQUIRED FOR SET

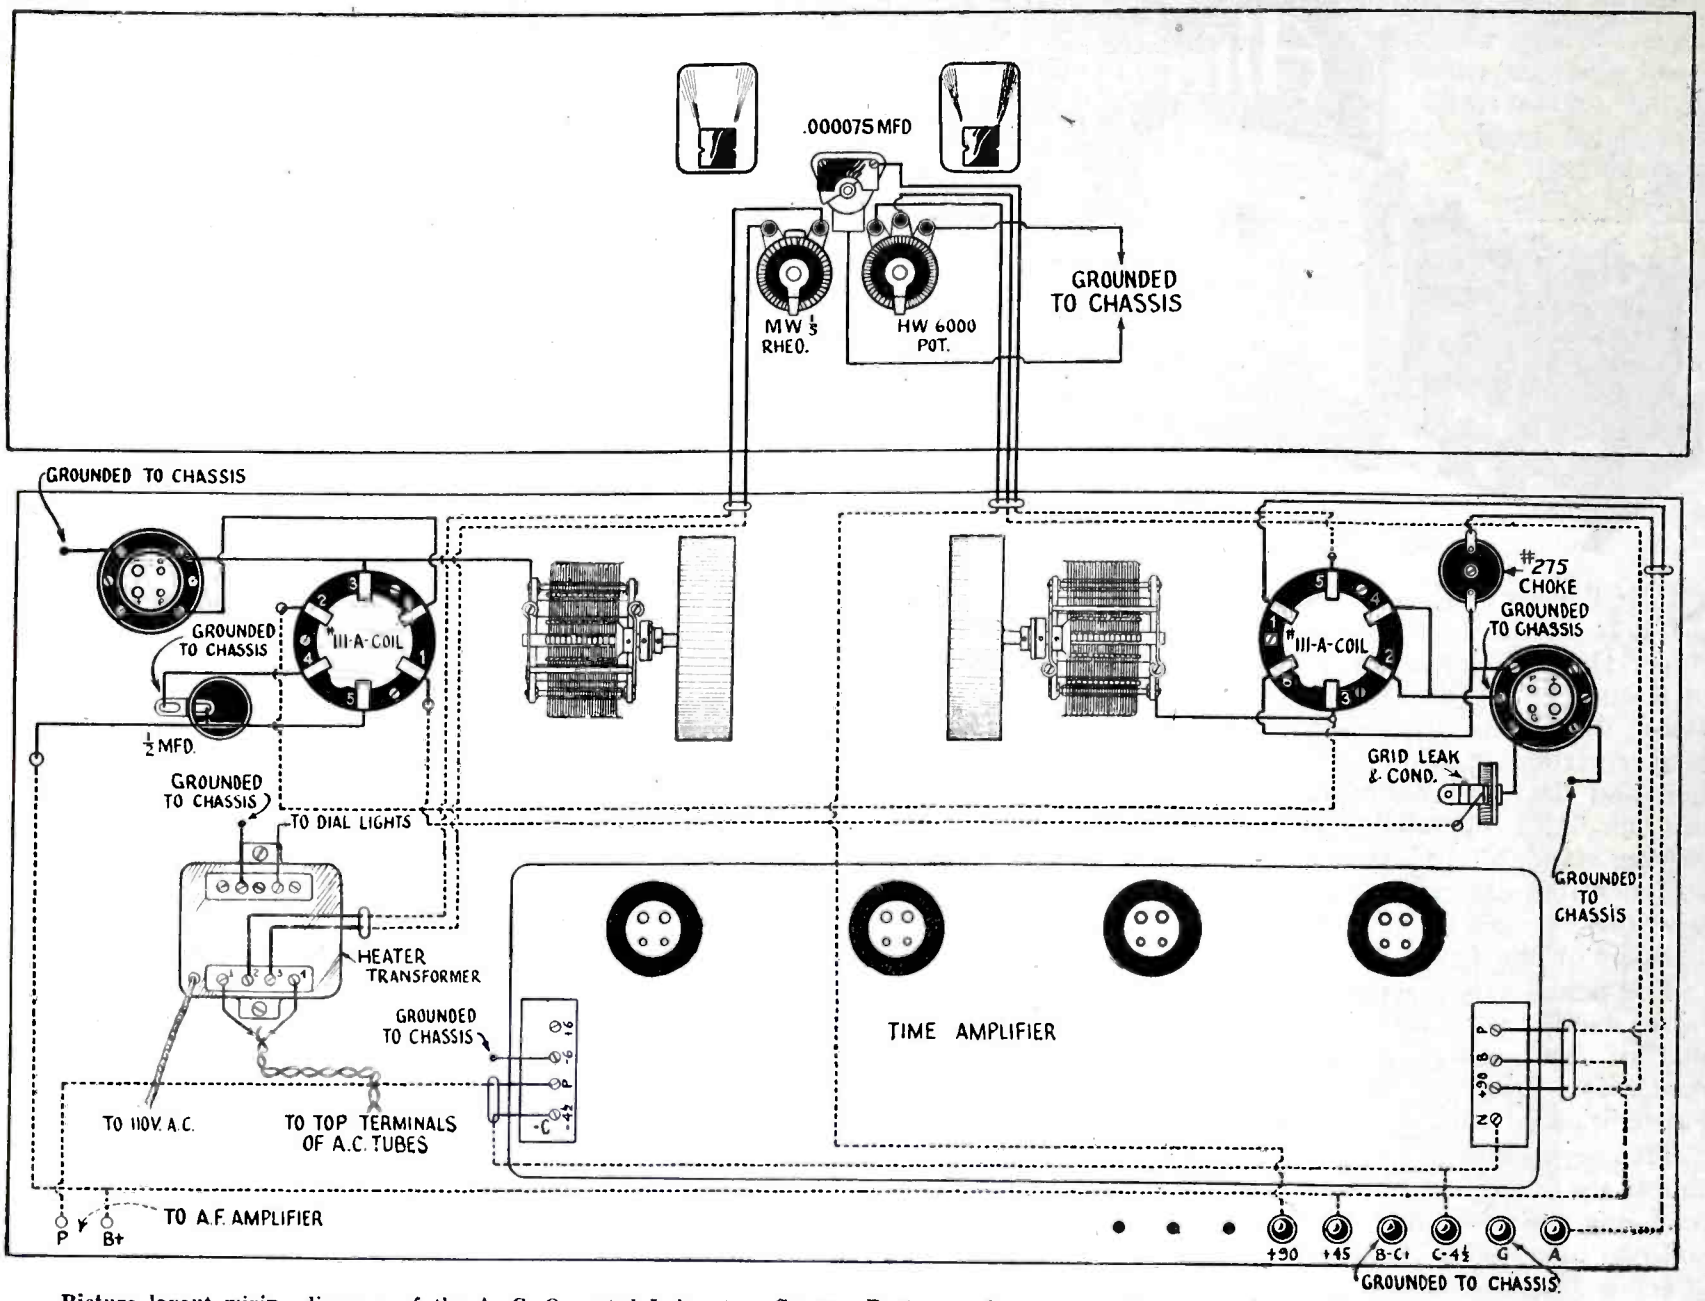
1 Van Doorn panel and chassis unit, pierced, with hardware
1 Carter .00015 mfd. condenser with grid leak clips
1 Carter potentiometer HW6000
1 Carter No. 103 ½ mfd. condenser
1 Carter 3 ohm rheostat MW ⅕
1 Carter power switch No. 110
4 Carter No. 10 tip jacks
1 Polymet 2 megohm leak
2 Silver-Marshall 511 tube sockets
2 Silver-Marshall 805 vernier drum dials
1 Silver-Marshall 275 R.F. chokes
1 Silver-Marshall 342 condenser, .000075 mfd.
1 Silver-Marshall 440 time signal amplifier
2 Silver-Marshall 515 coil sockets
2 Silver-Marshall 111A coils
6 X-L binding posts
2 Silver-Marshall 316B .00035 mfd. condensers
1 Silver-Marshall 325 filament lighting transformer
6 Sovereign A. C. tubes.

The F— filament terminals of the tube sockets are grounded, and the "A" power brought to the tubes through a pair of twisted leads connecting all the top binding posts of the A.C. tubes in parallel. All filament connections for the tubes of the set should be led directly through a pair of twisted wires to the windings of the heater transformer as shown in the diagram. The 200 ohm potentiometer, with its by-pass condenser, as well as the filament rheostat, are eliminated, the "—6" post of the long wave amplifier connecting directly to the chassis ground. The "N" post is connected to the C— 4½ volts. A 6000 ohm variable wire-wound resistor, mounted in place of the potentiometer, and insulated from the panel, should be connected between B+90 and ground, with the B+90 lead from the amplifier unit connected to the variable contact, this resistor functioning as the new "Gain" control. The battery type 3 ohm rheostat



Schematic diagram of the Laboratory Super wired for use with A. C. tubes. Ground connections as indicated are made through the metal chassis and front panel on which the various parts are mounted.

is also replaced with a heavy duty rheostat as specified and is connected across terminals 2 and 3 of the heater transformer. It is advisable to use one 4½ volt dry C battery for the second detector and first audio stage, rather than to obtain this voltage from a resistance drop. Either 3 or 4½ volts will prove best, depending on indi-



Picture layout wiring diagram of the A. C. Operated Laboratory Super. Parts are shown in smaller proportion to the metal panel and chassis. All grounded leads are clearly indicated. The cords from the heater transformer may be either connected to a power switch, mounted on the panel or plugged directly into a switch socket in the house lighting line. The twisted pair of cords from terminals 1 and 4 of the heater transformer are connected to all six A. C. tubes in the set as shown in the photo directly below. Connections for the dial lights are not shown in this diagram.

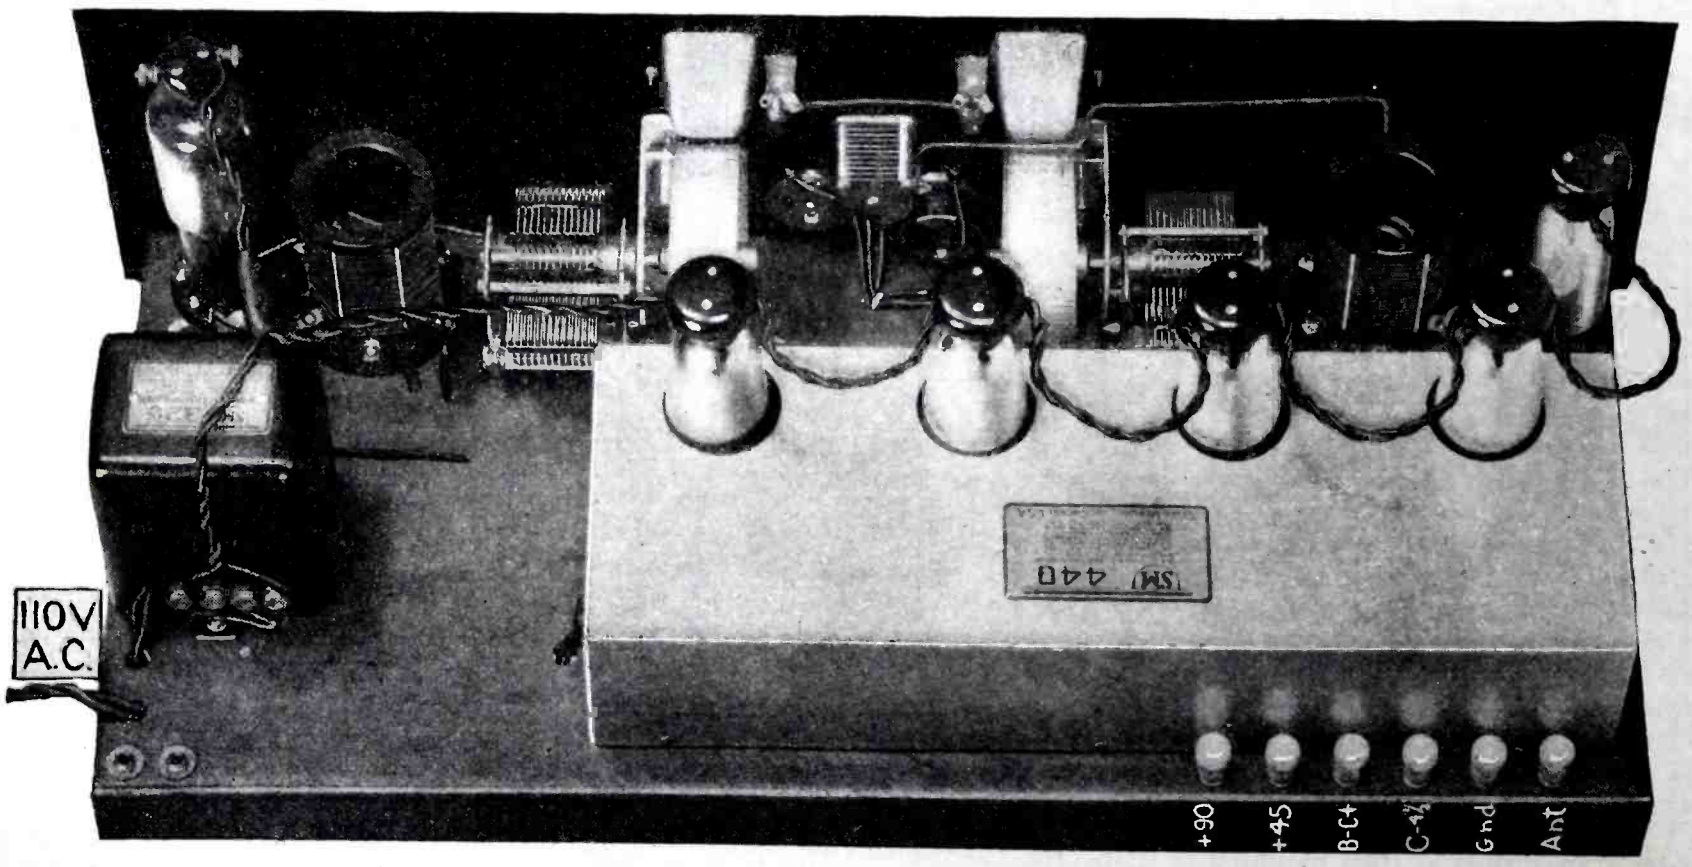


Photo of the Laboratory Super with tubes in place and completely wired. All tubes are connected in parallel. Output tip jacks in the back corner of the sub-panel connect to the P and B+ terminals of the power unit. Other connections to the binding posts are indicated.

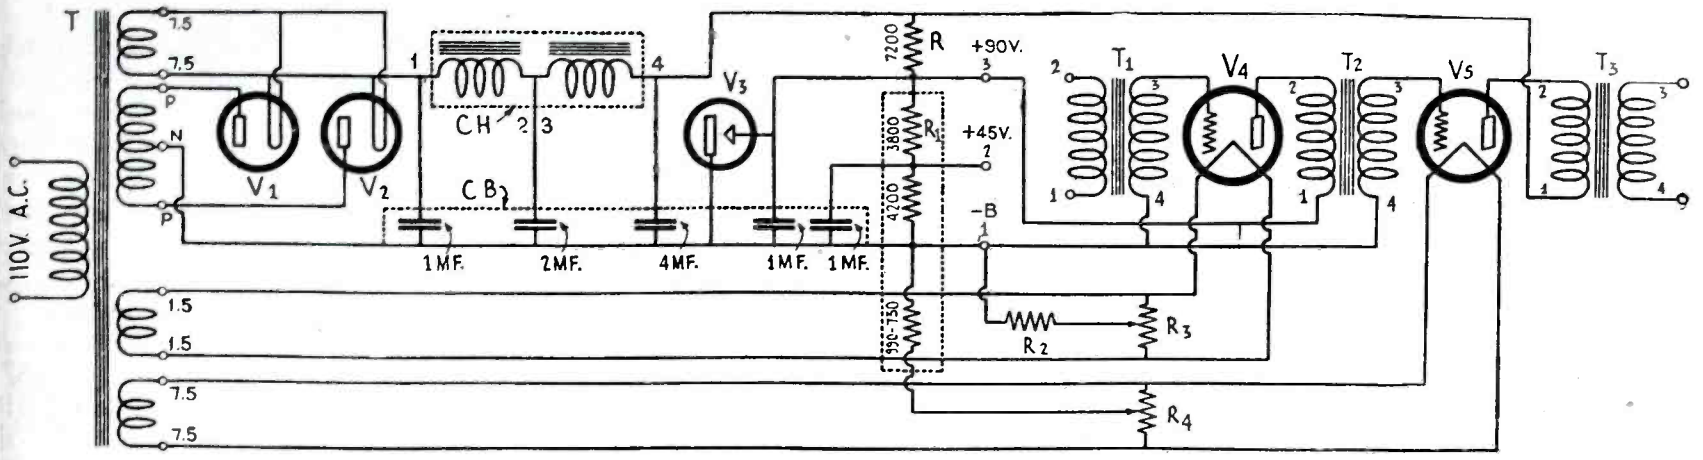
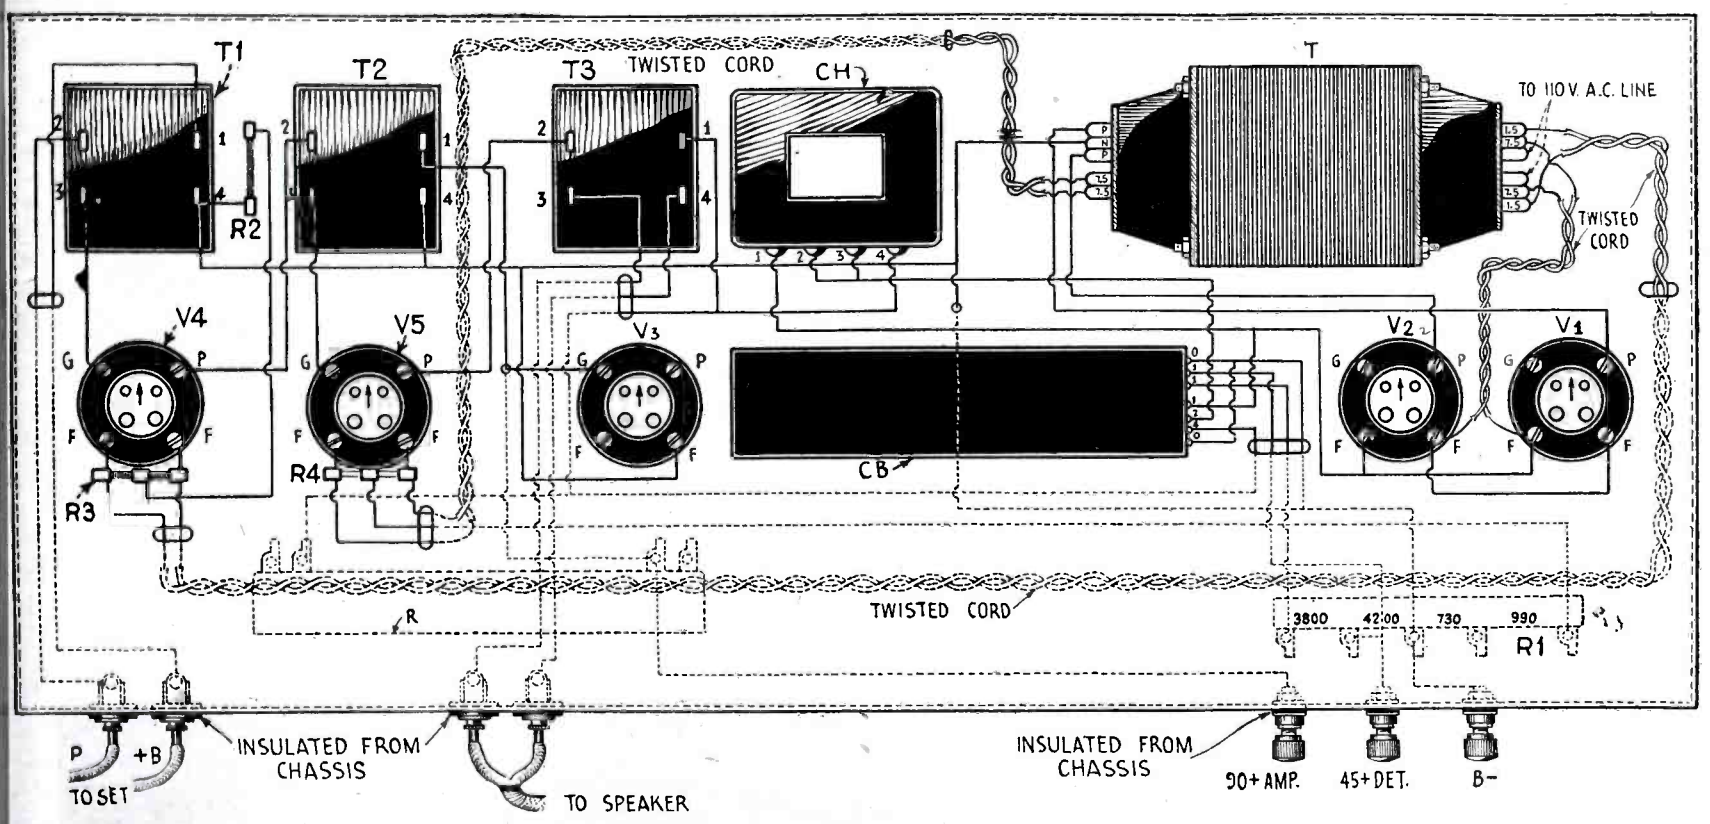
vidual conditions. A filament switch of the power type as specified in the list of parts may be substituted for the battery type on the front panel. This switch can be used as an on-off switch for the A.C. supply, with the leads brought out from the set.

The Power Unit

The L.C.-28 Unipac unit employed with the set consists of a complete two stage audio amplifier with "A" and "B" battery power supply operating entirely from a 105-120 volt, 60 cycle, light socket. This unit has been designed especially for use with the L.C.-28 receiver and it will serve as a high quality and powerful audio amplifier and "B" supply in connection with any standard receiver having no audio amplifier. It will also function as a complete light-socket operated phonograph



Schematic wiring diagram of the L. C. 28 Unipac amplifier and power unit. Dotted lines enclosing condensers, chokes and resistances indicate that the group of instruments is assembled as a single unit.



Picture layout diagram of the L. C. 28 Unipac. Wiring shown in solid lines are leads above the metal chassis while wiring and parts in dotted lines are beneath.

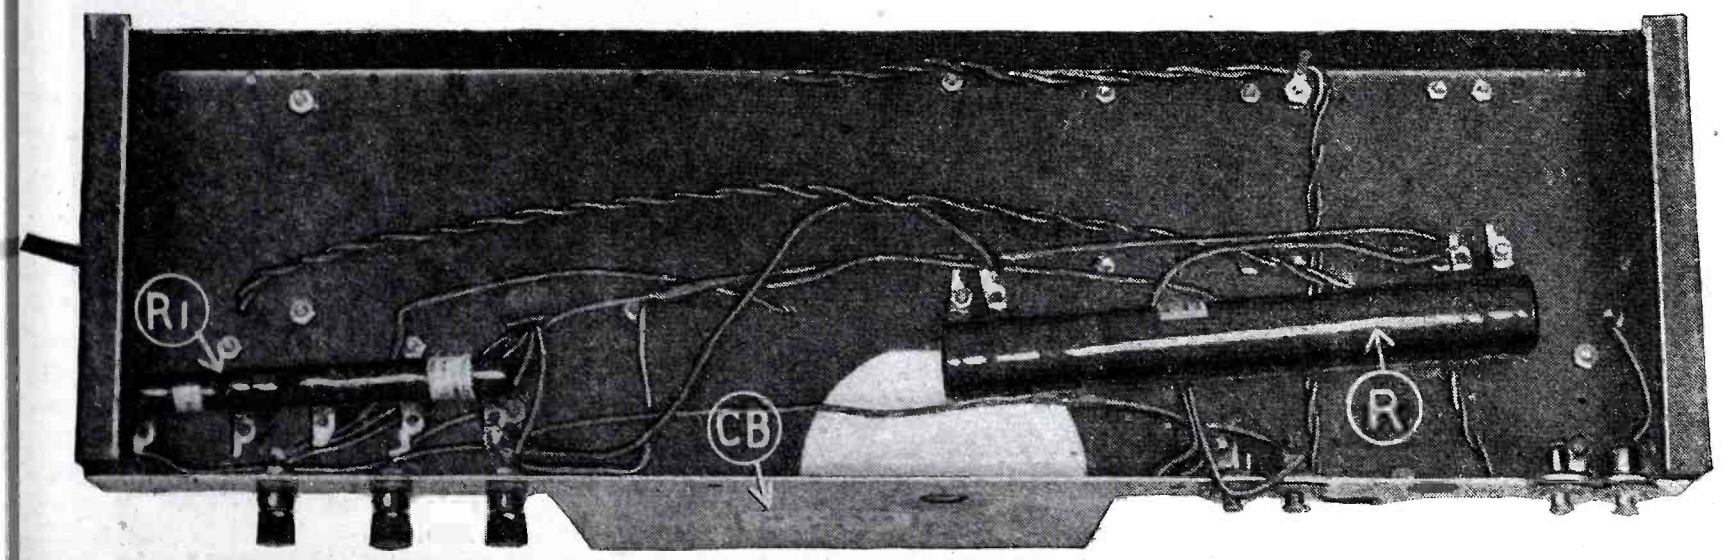


Photo of the power unit from beneath the metal chassis showing the two resistance units R and R_1 mounted in position.

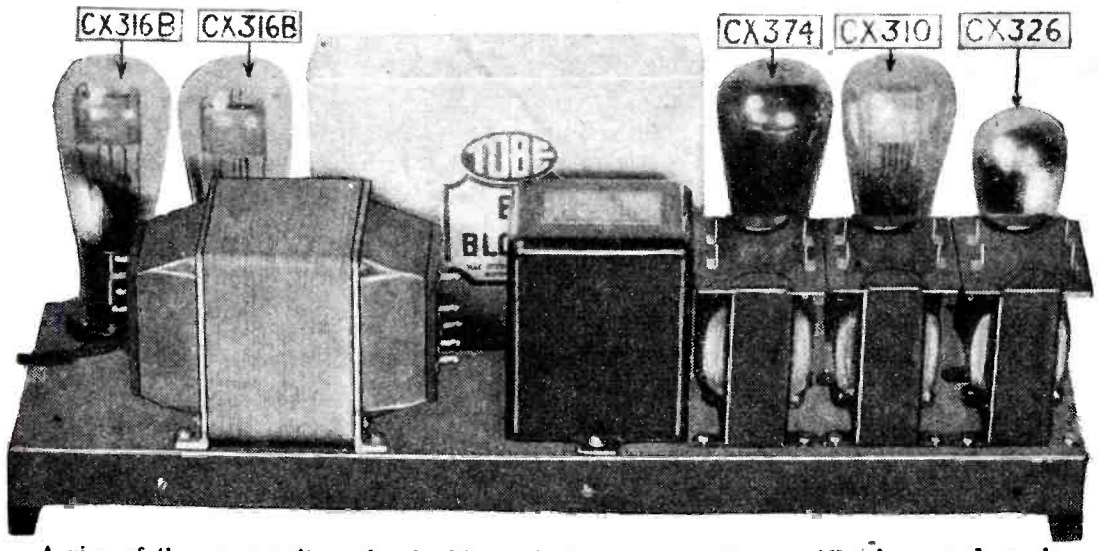
amplifier upon the addition of a loud speaker and magnetic phonograph pick-up. Thus, the amplifier, loud speaker, and pick-up allow the complete electrical reproduction of any existing mechanical phonograph with results equal or superior to those obtainable from the more expensive electrical phonographs which are today so desirable.

By carefully comparing the accompanying photos, schematic and picture wiring diagrams of the L.C.-28 Unipac, little difficulty should be experienced in assembling and wiring this unit. While parts are shown in smaller proportion to the metal chassis in the picture diagram the reader can readily note the location of the various components. Connections shown in solid lines are made above the chassis, while those shown in dotted lines are beneath the chassis.

After both the set and power unit are completely wired as shown, the latter may be placed in the console or radio table. The leads connecting the set with the power unit, B+, P., 90+ Amp., 45+ Det. and B— are made with a suitable connector cable or wire. A separate type 4½ volt "C" dry cell is then connected to the set and both cord and plug from the set and power unit are connected to the 110 v. A.C. line by means of a two way outlet.

Place a CX326 type A.C. amplifier tube in socket V4. Place a CX374 glow valve in socket V3, and CX310 in socket V5. Place two CX316B rectifier tubes in sockets V1 and V2.

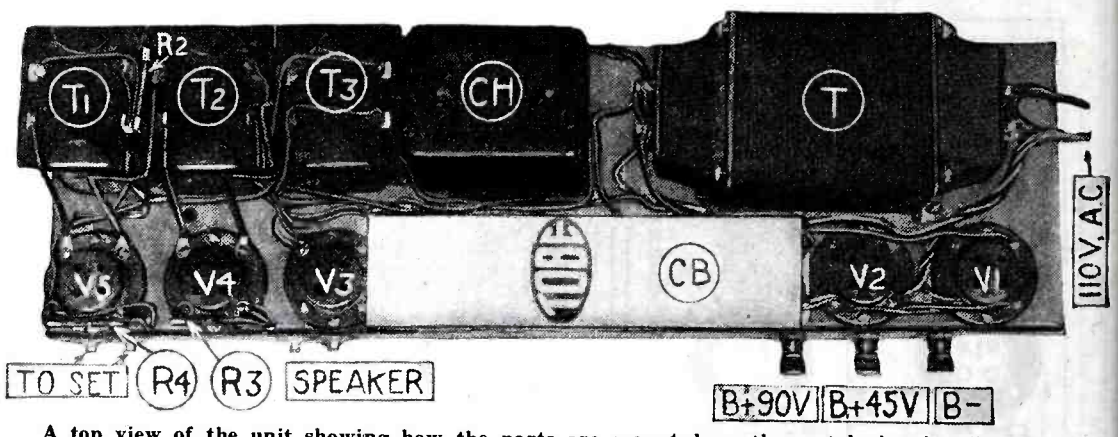
The unit is now ready for operation, either the switch on set is turned on, or the switch of the socket of the house lighting lines, providing a loud speaker has previously been connected to the two tip jacks on the power unit.



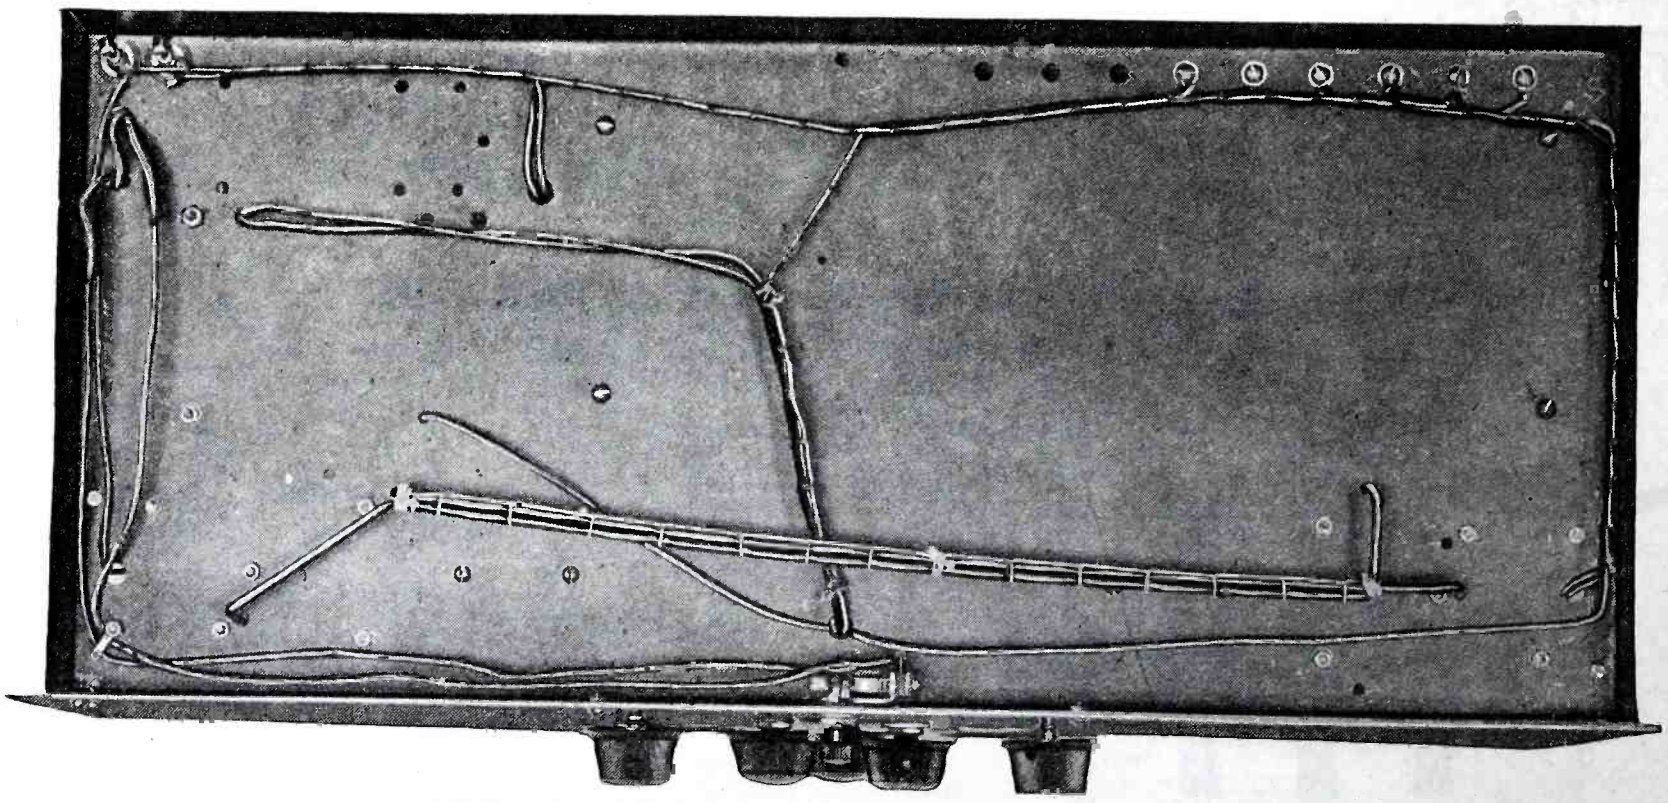
A view of the power unit employed with the A. C. Laboratory Super. All tubes are shown in their respective sockets.

PARTS FOR POWER UNIT

1 Silver-Marshall 323 full wave super power transformer, T
1 Silver-Marshall 331 Unichoke filter system, CH
2 Silver-Marshall 240 audio transformers T1, T2
1 Silver-Marshall 341 output transformer, T3
1 Tobe 682 condenser bank, CB
5 Silver-Marshall 511 tube sockets, V1, V2, V3, V4, V5
2 Ward-Leonard S651 resistors, R, R1
4 Frost 253 tip jacks
1 Van Doorn 661 steel chassis and cabinet with hardware
3 Eby binding posts, (B—, +45, +90)
2 Frost FT64 resistors, R3, R4
1 Frost F1000 resistor, R2



A top view of the unit showing how the parts are mounted on the metal chassis. Parts are indicated to correspond with diagrams, etc.



A bottom view of the Laboratory Super wired for use with A. C. tubes.

There are no further adjustments to be made either to set or the power unit and the set is operated in the usual way.

Cone Speaker with Double Magnet Unit

A new and advanced idea in design and construction of cone speakers is embodied in the cone speaker shown in the accompanying photo. Though the cone diaphragm is only seven inches in diameter, the speaker has a remarkably wide tone range.

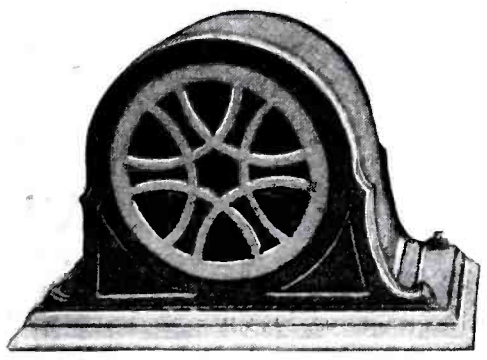


Illustration by courtesy of United States Elec. Corp.

A double magnet unit employed in the speaker illustrated above makes possible greater sensitivity and undistorted volume.

The outstanding feature of this speaker is a special double magnet unit with a balanced armature and closed field. This makes possible greater sensitivity and undistorted volume with less input energy.

This particular speaker is made in two styles, one in a plain wooden box and the model as illustrated which is enclosed in a handsomely decorative wooden cabinet.

"A" and "B" Unit for A. C. Sets

Power units, for use with receivers employing the new 226 and 227 type (A.C.) tubes, may be of very simple and compact design. This is proven by the efficient compact device shown in the photo herewith. Although it weighs less than fifteen pounds and is only 6½ inches high by 6¾ inches wide by 9 inches long, it is capable of delivering ample power for both the plate and the filament circuits of sets employing seven tubes, with a 171 type power tube in the last stage of amplification. Also the unit may be used in connection with sets employing storage-battery tubes; as it will supply plate ("B") power to all tubes and filament ("A" battery) current for the power tube.

Electrically, the unit consists of a standard plate-power-supply device, together with a special transformer having three additional secondary windings for providing filament current for the A.C. tubes. The plate-power-supply circuit has a maximum output of 180 volts at 50 milliamperes, and there are three taps which provide the voltages usually required. The three low-voltage windings of the transformer deliver the operating potentials required by the filaments of the A.C. tubes. A 1½ volt winding has ample capacity for supplying seven 226 type (A.C. filament) tubes; a 2½ volt winding will provide power to as many as four 227 type (heated-cathode) tubes; and the 5 volt secondary supplies current for the filament of the 112 or 171 type power tube in the last audio stage.

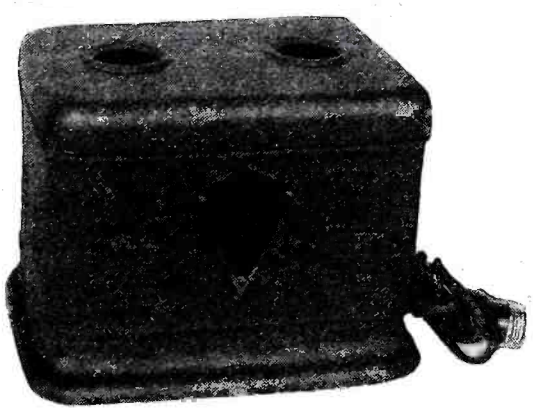

Illustration by courtesy of Harold Powers, Inc.

Photo of the "A" and "B" unit for receivers employing new A. C. type tubes. This unit is capable of delivering sufficient power for both plate and filament circuits of sets using seven tubes.

Although there is no variable voltage regulator on the front panel, it is possible to obtain the exact plate voltage required by making a simple adjustment inside the unit.

To place this device in operation, the top is removed to insert the rectifier tube and for making connections to the low-voltage windings of the transformer. The high voltage output terminals of the unit are located on the bottom and are accessible from the outside. The voltage adjustor is located in the top compartment.

No separate "C" voltage terminals have been incorporated in the power unit; but these potentials may be obtained by the use of proper biasing resistors in the receiving set.

New Fan-Type Loudspeaker

Since the advent of the cone type loudspeaker the advantages of vibrating a large surface as compared with the small diaphragms used in horn speakers have been very forcibly demonstrated. From the standpoint of faithful reproduction the cone type is to be favored. In the loudspeaker illustrated, a large pleated paper disc, resembling a fan in appearance, from which it gets its name, is employed. In operation the speaker is more like the cone than the horn species, and since the disc is 20" in diameter, it functions very well on the low or bass notes, giving a rich, mellow natural tone to the reproduced music.

The beauty of this new fanspeaker can be only partly appreciated from the illustration. The ornamental diaphragm, being center-supported on the drive pin of the unit, is totally free-edged, and can be removed from the unit at will. It is clamped at the center with two metal discs, which may be removed, thus making it possible to collapse the diaphragm and place it in a small cardboard tube for portability. The diaphragm may be opened up again, turned inside-out so that the former center becomes the edge and the edge becomes the center, giving new color schemes. Thus, each diaphragm has *four* different designs, two in brown and gold on one side, and two in black and silver on the other.

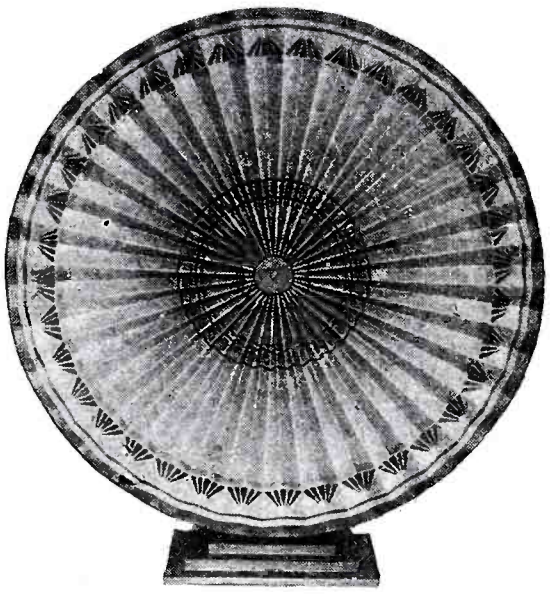

Illustration by courtesy of Fanspeaker Radio Co.

The speaker shown in the above photo employs an ornamental paper diaphragm in the form of a fan.

This adapts it to the most beautiful of home interiors; it enhances the beauty of any radio set.

In addition to its ornamental features, the collapsible diaphragm is ideal for portable receivers. The wall type model, same as illustrated except without base, may be used for this purpose.

The unit is of the direct-drive type, with a thumb-nut adjustment on the rear. Thus it can be adjusted to suit any set, with or without power amplification. It is of special rugged construction so as to insure rigid support of the diaphragm.

An Electrolytic "A" Power Unit

A new system, which is totally different from that used in the various storage battery trickle-charger types of "A" power units, is employed in the device shown herewith. The unit, when connected with the 110-volt, 60 cycle power line, will provide two amperes of direct current at a potential of six volts for heating the filaments of tubes in a radio receiver. In design

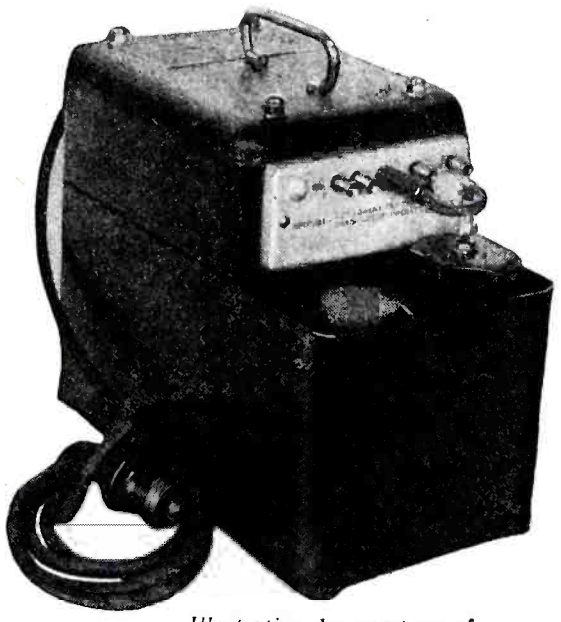

Illustration by courtesy of Fansteel Products Co., Inc.

The "A" battery power unit described herewith consists of an electrolytic rectifier and filter.

the device consists of a rectifier and filter circuit, built into a compact unit which weighs less than fifteen pounds. It does not contain a storage battery of any kind, and requires practically no attention of any kind.

For the rectifier an electric cell of the electrolytic type is employed. This cell is connected to the light-socket circuit through a step-down transformer which changes the lighting voltage to the value required by the power unit. The electrolyte used in the rectifier consists of an alkaline solution, which is covered by a thin film of oil to prevent evaporation. When shipped the unit is dry, and the cell contains only the solid alkaline substance and a small quantity of oil. When the user wishes to place it in operation, it is necessary merely to add distilled water. With continued use over long periods of time, the quantity of water may depreciate to some extent, and after three or four months it may be advisable to add a slight amount of distilled water to the cell. However, even if water is not added, the unit will not be injured.

In the filter circuit of the power unit there are a condenser and choke coil, connected in the usual arrangement. The condenser is also of the electrolytic type and employs the same electrolyte that is used in the rectifier cell. The condenser has two sets of plates submerged in the liquid and electrically, is employed as two separate condensers.

An "A, B and C" Unit with Automatic Relay

This new unit comprises a storage battery, a trickle charger, a power-control relay, and a plate-supply device with provision for obtaining grid potentials. It provides a compact, automatic accessory suitable for electrifying any type of radio receiver using standard 6 volt tubes. The unit requires practically no attention, it has ample power for all types of receivers, and its operation is controlled by the battery switch on the panel of the receiving set.

Dry electrolytic rectifier cells are used in the trickle charger circuit of the power unit. These cells are very convenient, for they do not require any attention such as adding water, etc. A step-down transformer connected in the 110 volt, 60 cycle power circuit supplies the low-voltage alternating current used by the rectifier; and after it has been converted into pulsating direct current, the rectifier delivers this current to the storage battery. The

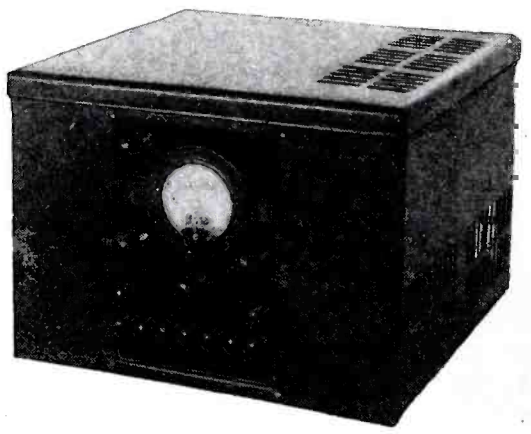

Illustration by courtesy of Sentinel Mfg. Co.

The complete "A, B and C" unit which is combined with an automatic relay device.

storage battery used is a small 6 volt, low capacity unit.

In the operation of this unit the storage battery is kept at full charge at all times which is accomplished automatically by a unique automatic power-control relay.

In the "B" power supply circuit of this unit there is a standard type of step-up transformer which supplies two half-wave rectifier tubes of special design. The filter circuit is standard, consisting of a condenser block and two iron-core choke coils. In the voltage dividing circuit there are three variable resistors, regulating the potentials delivered to the detector, the radio and audio amplifiers, and the grid of the power tube. Still another variable resistor is connected in series with the filament circuit of the rectifier tube, and used to control the output voltage of the entire plate power supply unit.

The power available in the plate-supply or "B" circuit is ample, even for the operation of large receivers. The plate voltage is more than is required for the operation of a set using a 171 type power tube, and the grid bias is adjustable up to 40 volts. On the front panel is a meter which enables the owner to check up on the voltage of the various circuits.

An Automatic "A" Battery Charger

An automatic "A" battery charger employing a rectifier of the new "dry" type is shown in the accompanying photo. The device is entirely enclosed

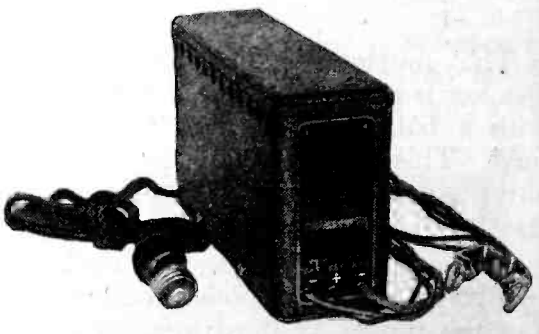

Illustration by courtesy of Apco Mfg. Co.

The complete charger as it appears ready for service.

in a steel case, 9 inches long, 3 inches wide, and 5½ inches high. The metal case is coated with a pleasing, brown crystalline finish. The unit is of the trickle-charger type, designed to charge the battery at 0.75 amperes; and is equipped with a series relay, so that it starts charging automatically when the set is turned off. When the set is switched on, the charger is automatically disconnected and the "B" power unit commences operation. Once the set is switched off again, the charger comes into action at a rate sufficient to keep the battery always at maximum efficiency. These advantages makes it a real trouble-saver. In addition to its automatic switching, it is absolutely noiseless in operation and, once installed, keeps the "A" battery in good condition.

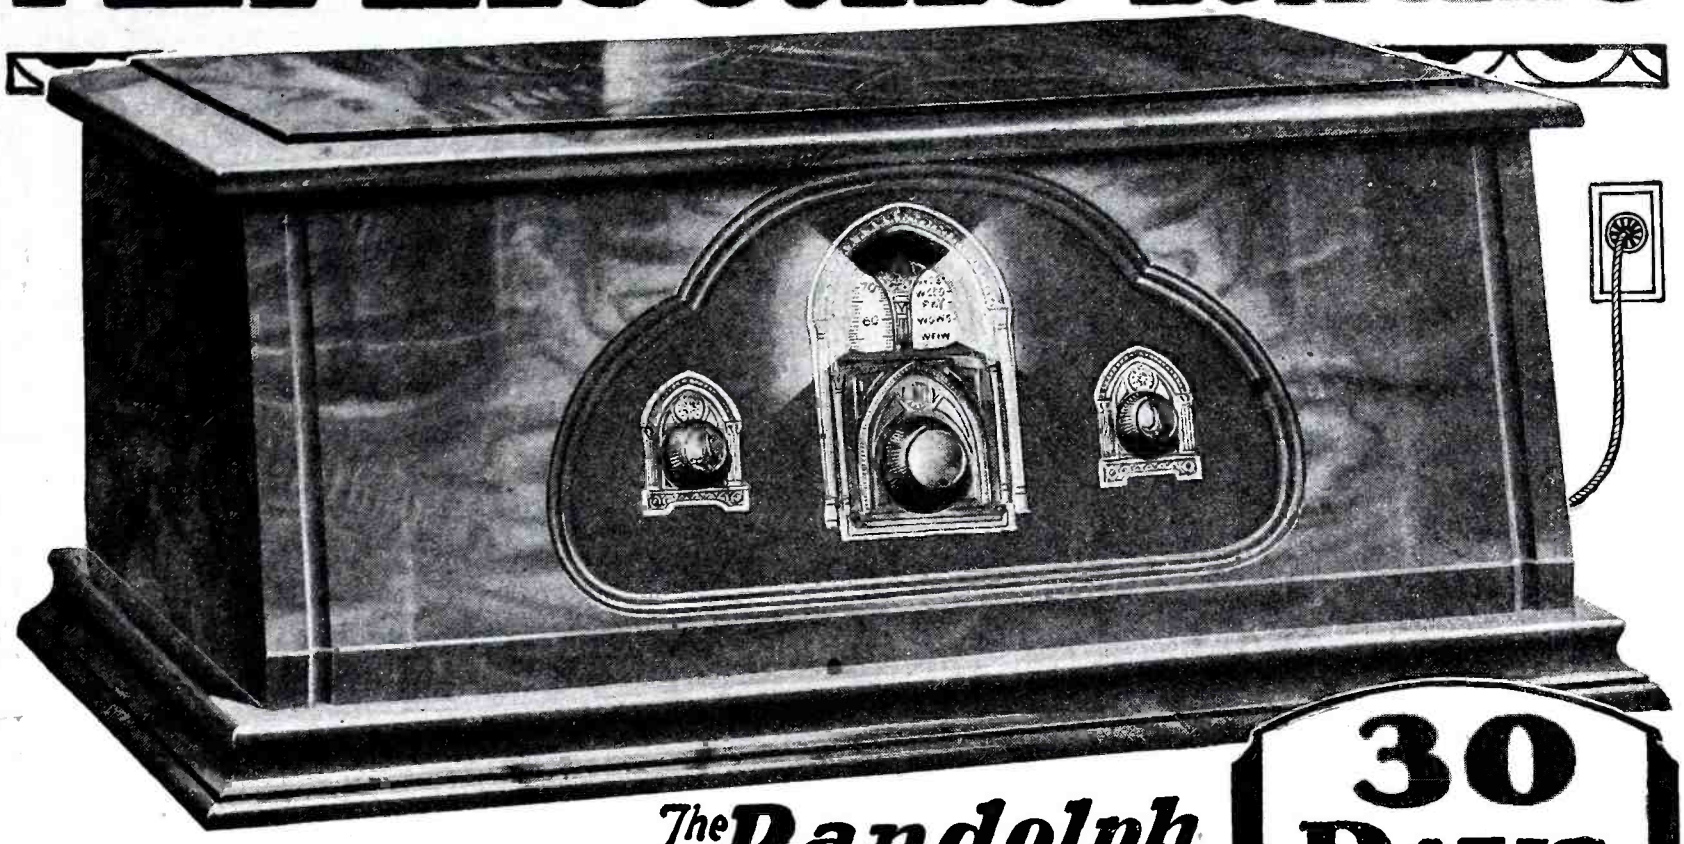
All Electric Radio



The Randolph 7 Tubes-Single Control

JUST plug this Randolph Radio into the electric light socket—and tune in. A powerful, selective radio that gives dependable coast to coast reception. **No batteries, chargers, eliminators, acids or liquids.** Here is complete radio satisfaction whenever you want it. The easy tuning with one control brings on all stations. Illuminated drum allows you to operate the radio in the dark and has space for logging stations. Every detail of the Randolph is modern and perfected—it is the utmost in radio—unsurpassed regardless of price. It is this wonderful radio that you test and try for 30 days FREE before you buy. Listen to it in your own home. When it convinces you by actual performance it is the ideal radio—the one you have always hoped for—**you can buy it direct at factory prices.** Be sure you write for free descriptive literature today.

Beautiful Ampliphonic Console

Illustrated here is one of the beautiful Randolph Seven Console Models—made of the finest carefully selected heavy solid walnut, hand-rubbed and with burl finish. Has built-in genuine large cone speaker that compares with any on the market. Assures unlimited reception of high notes and low notes clear as a bell. Completely electric—**uses no batteries of any kind.** Be sure you send for fully illustrated, full color folder giving complete details.

Genuine Walnut Cabinets

The finest of heavy, genuine, solid burl finish walnut is used in the making of all Randolph cabinets. No picture can do them justice. You must see them to appreciate them.

6-Tube Radio

New, modern, single-control, six-tube radio. Do not compare this set with old-style, 2-dial, 6-tube sets selling for about the same price. The Randolph 1928 Senior Six has also been tested and approved by the leading radio engineers. Comes in beautiful solid walnut cabinet of hand-rubbed finish. Single control. Illuminated drum with space for logging. Absolutely dependable and very selective. **Send for 30 days free trial. You test it before you buy.**

All Sets Guaranteed

Biggest Discounts to Agents

Work either full or part time and make big money. Sensationally big discounts to agents. No experience required. Randolph All-Electric Sets sell on first demonstration. The Perfam A. C. Four

(*Continued from page 93*)

and grid return of the first audio transformer. This is a very satisfactory method and controls the volume from a whisper to full tones.

The transformers used give a rising amplification curve necessary to good reproduction for 30 cycles to 5000 cycles and over.

The Assembly

Before starting the actual assembly of the receiver, each part should be examined with the utmost care to make sure that it has suffered no damage in transit or handling before being received by the builder.

The layout and circuit drawings should be studied for all important points. The front panel should be laid out first as the drilling for the drum dials requires quite a few additional holes. Particular care should be used in following the instructions which accompany each dial. The other parts require only one hole each and are easy to mount. After arranging the front panel, this may be laid to one side for the time being while the sub-panel should be laid out, due care being taken that the apparatus on both panels when placed together do not overlap.

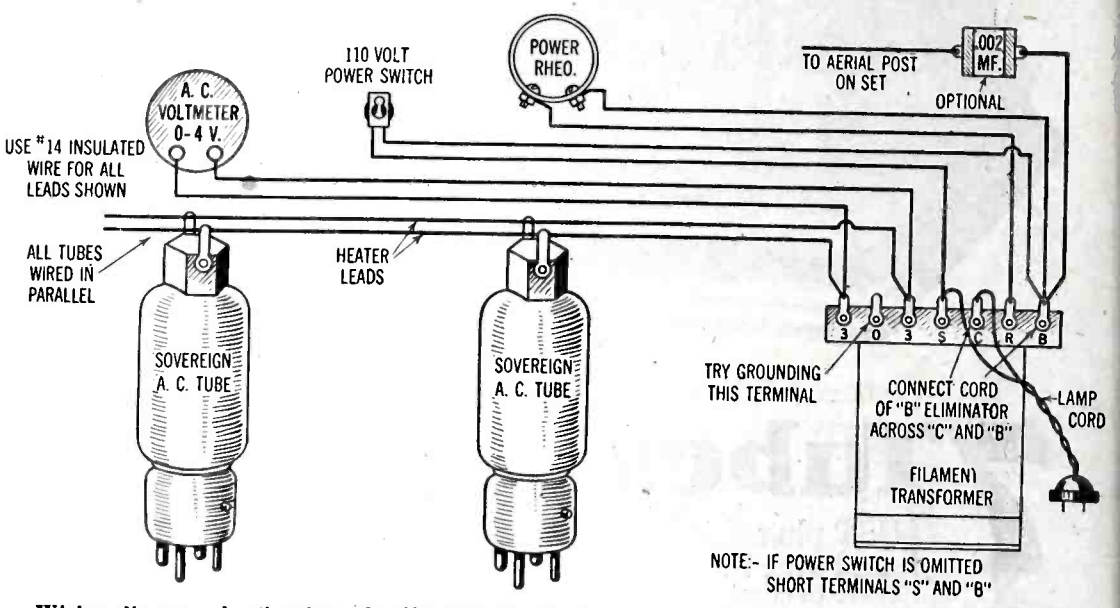
Wiring of the receiver itself is quite simple. Flexible wire such as Acme Celatsite which comes in colors should be used; the various colors will serve for identification purposes. Also with the use of such wire, the danger of the possibility of closed loops and other causes for feed back as with bus-bar wire is eliminated. Small holes should be drilled in the sub-panel near the terminals of the various parts, to permit connections from underneath the panel to object assembled above.

All grid and plate connections from tube sockets to their connecting terminals on coils and condensers, should be made above the sub-panel. By referring to the schematic and pictorial wiring diagrams, all wiring of the set can be easily followed. Leads should, of course, be as short as possible. The wiring for the grid returns should lead to one side of the socket marked F minus. As there may be some confusion at this point, the two F posts on the socket may be connected together. This is a sure way and no harm will result as one of the posts is dead at all times. As the two wires which run to the power switch have alternating current flowing through them, it is better to enclose these two leads in flexible metal tubing such as Belden's ¼" copper tubing.

The wiring for the filaments is shown in the separate sketch for tubes and transformers. Loops should be placed in the wires to allow sufficient slack in case it is desired to change a tube. The lead to the house supply should leave the set as near the transformer as possible, as these wires carry 110 volts A.C. The connecting cord should be standard rubber covered and approved by the Board of Fire Underwriters for such purposes. All other connections to the "B" supply are made with the Yaxley cable plug. It is easily seen how quickly a set can be disconnected should it be desired to move it, only two operations being required.

Assuming that all the connections have been made correctly, connect the "B" battery or current supply to its respective leads in cable. The radio frequency stage should have from 67½ to 90 volts, while the detector battery should be near 4 volts, and up to 180 volts may be used for the audio stages.

Connect the antenna and ground. In some cases the receiver will operate without an antenna by putting a .002 mfd. fixed condenser between aerial post and point "B" on filament transformer. However, when the antenna is used, the .002 mfd. condenser should be disconnected.



Wiring diagram showing how the filament circuit of the set is wired from the heater transformer.

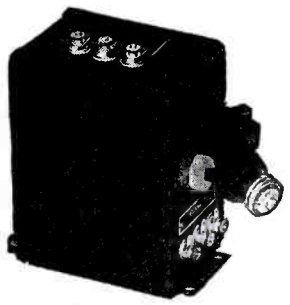
Transform your Receiver into a Real Musical Instrument!

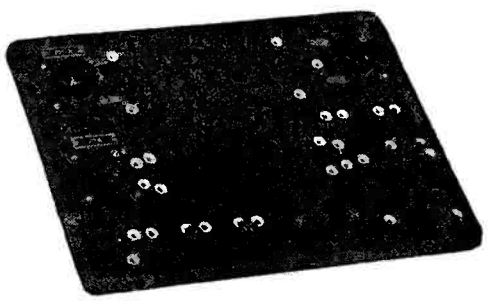


R-210 Power Compact . $20

With a screw driver, a pair of pliers, and a soldering iron you can build a Thordarson Power Amplifier and B-supply in your own home that will equal the finest commercial amplifier on the market. Complete constructional booklet and simple diagram accompany every transformer.

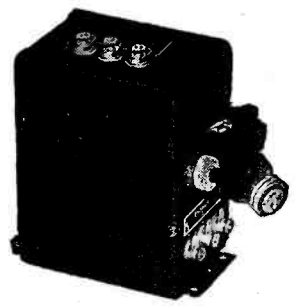
Thordarson R-210 Power Compact

The Thordarson R-210 Power Compact is scientifically designed to give maximum electrical efficiency and to make home assembly of power amplifiers as simple as possible. The R-210 Power Compact is the foundation unit and contains the following apparatus: (1) A power supply transformer designed for UX-216-B rectifier; (2) Two filter chokes of 30 henries inductance and 65 M. A. current carrying capacity; (3) A 7½ volt supply center tapped for the filament of one UX-210 power tube. Wiring of the complete amplifier is simple—20 leads complete the assembly.



R-211 Metal Baseboard, including sockets, binding posts, mounting screws, and hook-up wire $5

New Metal Baseboard for R-210 Compact Amplifier .



R-171 Power Compact . $15

To further simplify home construction of the R-210 type amplifier, you can now buy this new crackled finished metal baseboard. All spring sockets and binding posts are mounted and included in the list price. All mounting holes are drilled. All holes for sub-panel wiring are carefully insulated. Location of all sub-panel wiring is marked under baseboard.

R-171 Power Compact

This power compact is similar to the R-210 type, but is adapted for home construction of power amplifiers using the Raytheon BH rectifier and UX-171 power tube. Designed to meet the popular demand for a low priced yet highly efficient power amplifier. Delivers 320 volts either side of center to the Raytheon BH rectifier. The two choke coils are rated at 85 M. A. 30 henries. The filament winding of 5 volts center tapped is suited to one UX-171 power tube. Two 0.1 Buffer Condensers are also included in the case. Wiring the complete amplifier and B-supply is merely a matter of connecting 18 leads.

No. 2098 Power Supply Transformer . . $20

T-2098 Power Supply Transformer—T-2099 Double Choke Unit

Here is an extra heavy duty power amplifier supply that will satisfy the most exacting demands for excess power. An amplifier using this transformer and choke unit will deliver 425 volts at 130 M. A. drain, sufficient for the heaviest receiver using two UX-210 tubes in power push-pull. Transformer T-2098 delivers 550 volts each side of center tap and is designed to supply two UX-216-B rectifiers (full wave). The 7½ volt filament supply will easily handle two UX-210 power tubes. The double choke unit T-2099 consists of two 30 henries 130 M. A. choke coils mounted in a compound-filled case.

No. 2099 Double Choke Unit $14

Operating the Set

The set is now ready for testing and operation. Attach the cord from transformer to house supply. Connect the speaker to proper posts. No sounds will be heard for 12 to 20 seconds, as the heater unit requires a certain amount of time to heat up; just as does an electric flat iron. After waiting the necessary interval, tune the receiver in the regular manner; having tuned in a station, preferably one of the locals, advance the tickler coil until a squeal is heard. Now, by rotating the antenna coil condenser, the squeal will vary in pitch and intensity, if the set is not neutralized. By adjusting the position of the Phasatrol, the squeal can be brought to a point where it will vary only in intensity—not in pitch. This is the point where neutralization is obtained. If the builder has an A.C. voltmeter reading from zero to 5 volts, the greater life of the tubes and maximum efficiency can be obtained when the voltage to the tubes is set at 3 volts. This voltage is regulated by the power rheostat on the front panel.

These tubes will not operate from direct current and if the set is connected to D.C. even for a short space of time, the transformer will be ruined. This is very important as many good radio devices have been ruined by so doing, by people who only wanted to test the tubes to see if they would light, or what not.

When using the set, if a hum is produced, be sure "O" on the transformer is grounded, also try changing the detector tube. A tube that produces a hum as a detector, will work satisfactorily as an amplifier tube.

To test for burnt out tubes, remove one of the wires to the heater terminals and make and break their connections. A slight movement on the voltmeter when this is done is an indication that the tube is good.

After a little experience in operating the set, results obtained will be very gratifying. One of the most important things in radio reproduction is a good speaker, and when a cone is used, it is necessary to protect the windings from the direct current.

There are many fluxes for soldering but only *one*— is safe for Radio!

FLUX for soldering is a general term; it embraces, as a class, all types of soldering fluxes. To designate a flux as safe for radio construction is specific; *it means rosin.* Chloride pastes, acids and fluid solutions are soldering fluxes, and are well adapted for certain work, *but conductive and corrosive properties forbade their use for radio assembly.* Their active elements, zinc and ammonium chlorides, display spreading, creeping tendencies that promote leakage and will eventually cause increased resistance in the wiring.

Rosin, an organic mixture, *is a non-conductor and non-corrosive.* The glass-like surface of this material does not readily lend itself to the collection of dust (carbon particles) as will the sticky organic greases of paste. Nor will rosin attract moisture from the atmosphere; the chlorides of pastes and fluids will. *Moisture plus carbon particles defeat the best insulations produced. Moisture plus chlorides direct a slow but determined corrosive attach upon supporting metals.* Such slow corrosion in wiring causes a steadily increasing resistance to the flow of electrical energy.

Kester Rosin Core Radio Solder scientifically combines radio's premier flux, Rosin, with a solder alloy of unvarying quality. The use of Kester Radio Solder furnishes the user with a means of accomplishing Safer, Faster, and Cleaner set wiring. Constructors who solder-protect wiring with Kester Radio Solder enjoy increased receptive range, improved tonal quality and the satisfying assurance that their receivers will never be forced into the discard through the corrosive and conductive action of a chloride flux.

A Kester Soldered Receiver Is a Better Set

Manufacturers of Radio Sets and Equipment: Tests conducted with the various types of commercial fluxes are under constant observation in our laboratory. Can we assist you in your soldering problems?

The Knickerbocker Four

(*Continued from page* 85)

not oscillate regardless of the wavelength to which it is tuned. By moving the secondary coil toward or away from the tickler coil the amount of feed-back at the maximum setting may be regulated to just that required to produce maximum sensitivity but not enough to cause the circuit to break into oscillation. Then the minimum limit of the range can be fixed by changing the angle of the coils in their relation to the panel, so that the feed-back at minimum coupling is just that required for maximum sensitivity on the low waves. With the two limits of coupling thus set, the coupling at any intermediate wavelength will be just right to produce highest efficiency throughout the waveband.

Regeneration in the detector circuit provides amplification that is at least equivalent to that of another stage of highly efficient tuned radio-frequency amplification. If this is added to the single efficient stage of R.F. that is included in the Knickerbocker Four we have the equivalent of not just a five tube receiver but a five tube receiver of unusually high efficiency. This is a fair assumption because the one R.F. stage included in this receiver is of more than usual efficiency as a result of the use of the variable coupling with its attendant high and equal amplification of all signals regardless of wavelength.

The best feature of this arrangement is that, in spite of its high efficiency, only two controls are required, with no necessity for "ganging" or gearing controls together or any of the schemes usually resorted to in reducing the number of tuning controls of a receiver. Tuning is accomplished without any whistles or squeals—another unusual thing for a regenerative receiver.

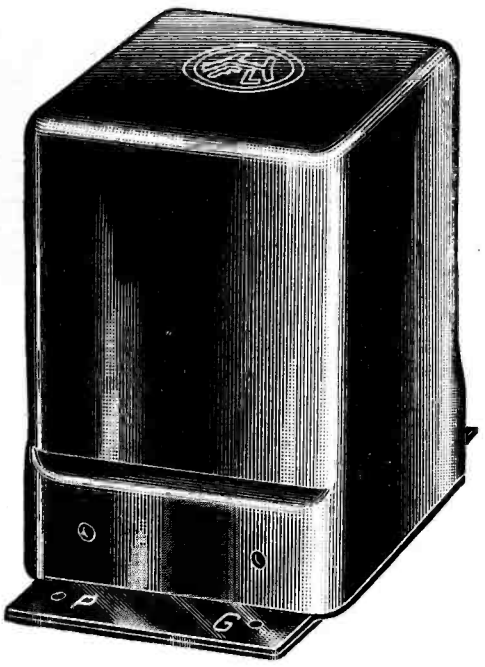
It may seem that an unusually large amount of space has been devoted to the description of the coupling and tuning control of this receiver. It is entirely logical that this should have been done, however, because after all it is only in these points in which this receiver excels others that its justification for existence lies. But to come back to the general description of this new receiver, and a discussion of its other good points.

The radio-frequency stage employs a standard circuit except that the method for neutralizing it is somewhat out of the ordinary. Instead of using a very small neutralizing capacity which is most difficult to adjust, this circuit employs a simple neutralizing system that requires a neutralizing capacity in

TRANSFORMERS

For Set Builders Who Demand

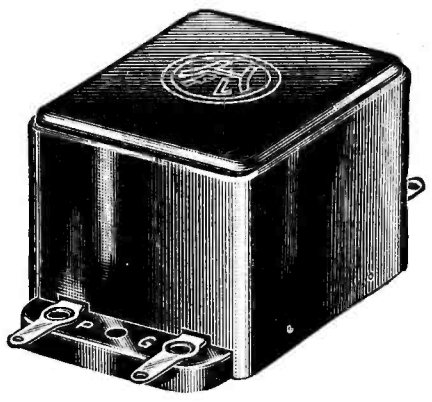
H. F. L. C-16 Audio Transformers and C-25 Output Transformer —new companions to the famous H. F. L. Products.



[EFFICIENCY SENSITIVITY PRECISION HIGH QUALITY BEAUTY]

MEMBER RMA

The new C-16 and C-25 Transformers will improve any circuit and will work in any Radio Set.



LAST SEASON'S RADIO SENSATION!

Now Greatly Improved By These Marvelous Additions—The Supreme Achievement In Audio Amplification

Technically and practically the H. F. L. C-16 is the most efficient Audio Frequency Transformer built. It is constructed to match perfectly the two circuits between which it is placed and carries signals at highest volume without blasting or developing harmonics, and will amplify signals of low amplitude as well.

Even with the most up-to-date broadcasting stations there is a noticeable loss in amplification at frequencies of 100 cycles or less, and again on the high registers of 5,000 cycles or over. Remote control operation takes another toll, only that the high register starts to drop off even sooner. In most cases at 3,500 cycles per second. Furthermore, it is a known fact that the amplification curves of the prsent day loud speaker shows over and under amplification of certain notes.

The H. F. L. C-16 Audio Transformer is so designed as to bridge over and under amplification. Therefore the amplification of all frequencies throughout the entire musical scale is accomplished with amazing, life-like truthfulness. A specially treated silicon steel alloy, combined with proper gapping and right proportion in density, make saturation of core practically impossible.

In conjunction with this core the correct size of wire and the correct balance of primary turns has been determined and is being used to insure the proper impedance and to make possible distinct amplification of low notes and frequencies of low amplitude with a marked absence of harmonics. The H. F. L. C-16 Audio Transformer is especially designed to operate with all power tubes as well as the standard type of tubes.

An important feature in connection with our C-16 audio is our H. F. L. C-25 Output Transformer. Its ability to handle the voltage output of the power amplifying tubes and at the same time match the impedance of the average speaker to the tubes, makes it a very desirable addition to audio amplification. It is especially recommended because of the protection it renders to the loud speaker unit without reducing the plate voltage.

The mechanical features of the H. F. L. C-16 and C-25 Transformers are: A coil designed and treated so as to exclude moisture and withstand heavy electrical surges without breaking down, complete magnetic shielding to avoid interstage coupling, with terminals brought out so as to insure short leads.

A Guarantee That Counts

We positively guarantee each and every H. F. L. Transformer against any mechanical or electrical defect.

Furthermore, we will exchange—free of charge—any H. F. L. Transformer that fails to give complete satisfaction, providing that the shells and terminals are not damaged.

HIGH FREQUENCY LABORATORIES

133A NORTH WELLS STREET **CHICAGO, ILLINOIS**

the neighborhood of .0001 mfd. The variable neutralizing condenser employed is adjusted by means of a thumb knob on the top. The whole adjustment can be made in a few seconds and doesn't even require the use of a screw driver. Moreover the setting of this condenser is not critical and thus one of the most unsatisfactory features of neutralized circuits is eliminated. The R.F. choke coil CH and the by-pass condenser C4 are part of this neutralizing system and are therefore essential to the circuit.

The detector circuit is unusual only in the automatic control of regeneration that has already been discussed in some detail. Otherwise it is the standard tickler feed-back circuit of many years standing.

Individual filament control rheostats have been included for the R.F. and the detector tubes. The first functions as a volume control while the detector rheostat controls sensitivity. When this rheostat is turned up to normal the detector operates at its most sensitive point—just below oscillation. By turning the rheostat down when this unusual sensitivity is not desired the noise level is decreased and local reception is generally improved. The R.F. rheostat provides a complete control over the volume, from maximum right down to a whisper.

There is little need for discussing the audio amplifier which is incorporated in this receiver. It is standard circuit design and the transformers used are so well known as to quality that this portion of the receiver may be dismissed with the statement that the tone quality and volume are all that one could expect or desire. The two audio tubes receive their filament supply through the automatic filament control units R3 and R4 so that there are no variable controls at all in this portion of the circuit.

Assembly of the Receiver

The front panel and sub-panel are first prepared according to the detailed drilling specifications shown in the illustrations. Then all of the parts are mounted. The proper positions are readily determined from the photos.

It will be noted that everything is made secure to the panel and sub-panel. Even the fixed condensers are attached to the sub-panel by means of bolts. This leaves little possibility for broken connections after the wiring is completed and the receiver put into operation.

The wiring of the receiver is a simple job if the picture wiring diagram is followed. Most of the connecting wires are under the sub-panel, out of sight. Wherever practical the leads are dropped straight down from the terminals of the instruments, through holes in the sub-panel and then are run along under the sub-panel to the other

terminal or to a point directly beneath the other terminal if it should happen to be the terminal of an instrument that is mounted on the top of the sub-panel. It is a good plan to complete as much of the wiring on the sub-panel as is possible before attaching the front panel.

All connections to the batteries and ground are made by means of a battery cable and plug. Thus instead of having a string of binding posts in the receiver there is only the small plug and mounting shown at the rear left hand corner of the sub-panel. This arrangement has several advantages. First of all, the plug takes up much less space than would a binding post strip. Secondly, all battery connections can be made before the plug is slipped into its mounting thus eliminating any chance for short circuits because of loose wires. Finally, the receiver can be completely disconnected from the batteries in a fraction of a second through the simple expedient of pulling out the plug at the rear of the sub-panel. This latter is a decided convenience when it is desired to move the receiver or when for any reason it is necessary to disconnect the power source from the receiver. In some homes, for instance, where there are small children, the parents make a practice of leaving the plug out when the receiver is not in use. Then if the youngsters should turn on the filament switch there could be no harm done, as the supply circuits are open.

The completed set can be installed either in a distinctive console such as the "Excello" or in a table type cabinet. If the latter is used, the set can be placed directly on top of an "Ensco" 3-foot cabinet type speaker which makes an ideal combination.

The receiver employs four CX-301-A tubes. For greater sensitivity, three CX-301-A tubes may be used in the R.F. and the two audio stages and a CX-300-A tube in the detector stage. Either of these combinations represents a total filament current drain of one ampere per hour. For the fan who has no facilities for frequent recharging of his storage battery this offers a decided advantage because a single charge of a standard size "A" battery will operate these four tubes for a month or more of average service.

To install the receiver the ends of the battery cable are connected with their respective terminals of the batteries and to the ground. Five of the leads are tagged with metal markers for A—, A+, B—, B+Det., and B+Amp. There are also two wires in the cable which have no tags. One of these should be used for the ground connection of the receiver. The other one remains unused. The antenna lead-in wire is connected directly to rear left-hand corner of the sub-pan-

30 Days FREE TRIAL 5 Year Guarantee

MARWOOD

The 1928 Sensations! 8 Tube-1 Control

ALL ELECTRIC 8 Tube 1 Control $98 RETAIL PRICE

Big Discount to Agents From this Price

Has Complete A-B Power Unit

A REAL ALL ELECTRIC Radio with one of the best A-B power units on the market—no batteries needed—at the world's lowest price. This Marwood can't be excelled at ANY price. If you have electricity in your home, just plug into the light socket and forget batteries. No more battery trouble and expense. Costs less than 2c. a day to operate. Always have 100% volume. ALL ELECTRIC Radios are high priced because they are new. We cut profit to the bone and offer a $250.00 outfit for $98.00 retail price. Big discount to Agents. Don't buy any Radio 'till you get details of this sensational new ALL ELECTRIC Marwood.

All Electric

Or Battery Operation

AGAIN Marwood is a year ahead—with the Radio sensation of 1928—at a low price that smashes Radio profiteering. Here's the sensation they're all talking about—the marvelous 8-Tube Single Control Marwood for BATTERY or ALL ELECTRIC operation. Direct from the factory for only $69.00 retail price a price far below that of smaller, less powerful Radios. Big discount to Agents from this price. You can't beat this wonderful new Marwood and you can't touch this low price. Why pay more for less quality? To prove that Marwood can't be beat we let you use it on 30 Days Free Trial in your own home. Test it in every way. Compare it with any Radio for tone, quality, volume, distance, selectivity, beauty. If you don't say that it is a wonder return it to us. We take the risk.

Only $69 RETAIL PRICE Big Discount to Agents From This Price

New Exclusive Features

Do you want coast to coast with volume enough to fill a theatre? Do you want amazing distance that only super-power Radios like the Marwood 8 can get? Do you want ultra-selectivity to cut out interference? Then you must test this Marwood on 30 Days Free Trial. An amazing surprise awaits you. A flip of your finger makes it ultra-selective—or broad—just as you want it. Every Marwood is perfectly balanced—a real laboratory job. Its simple one dial control gets ALL the stations on the wave band with ease. A beautiful, guaranteed, super-efficient Radio in handsome walnut cabinets and consoles. A radio really worth double our low price.

Buy from Factory—Save ½

Why pay profits to several middlemen? A Marwood in any retail store would cost practically three times our low direct-from-the-factory price. Our policy is highest quality plus small profit and enormous sales. You get the benefit. Marwood is a pioneer, responsible Radio, with a good reputation to guard. We insist on the best—and we charge the least. If you want next year's improvements NOW—you must get a Marwood—the Radio that's a year ahead.

Get Our Discounts Before You Buy a Radio

Don't buy any Radio 'till you get our big discounts and catalog. Save half and get a Radio that IS a Radio. Try any Marwood on 30 Days Free Trial at our risk. Tune in coast to coast on loud speaker with enormous volume, clear as a bell. Let your wife and children operate it. Compare it with any Radio regardless of price. If you don't get the surprise of your life, return it. We take the risk. Don't let Marwood low prices lead you to believe Marwood is not the highest quality. We have smashed Radio prices. You save half.

6-Tube—1 Control

This is the Marwood 6-Tube, 1 Control for BATTERY or ALL ELECTRIC operation. Gets coast to coast on loud speaker with great volume. Only $47.00 retail. Big discounts to Agents. Comes in handsome walnut cabinets and consoles. This low price cannot be equalled by any other high grade 6-tube Radio. Has the volume of any 7-tube set. If you want a 6-tube Radio you can't beat a Marwood and you can't touch our low price.

AGENTS

Make Big Spare-Time Money

Get your own Radio at wholesale price. It's easy to get orders for the Marwood from your friends and nabors. Folks buy quick when they compare Marwood quality and low prices. We want local agents and dealers in each territory to handle the enormous business created by our national advertising. Make $100 a week or more in spare time demonstrating at home. No experience or capital needed. We show you how. This is the biggest season in Radio history. Everybody wants a Radio. Get in now. el. The loudspeaker tips are inserted in the tip jacks, J1 and J2, which are next to the antenna binding post. This completes the connections.

With the four tubes inserted in their sockets everything is in readiness for the preliminary adjustment of the neutralizing and coupling devices. To neutralize the radio-frequency stage a low wave station is tuned in while the neutralizing condenser knob is all the way out and the R.F. rheostat is turned up full. The R.F. circuit should oscillate freely with this adjustment. Then, keeping the station tuned in, turn the neutralizing condenser knob to the right a little at a time until a point is reached where the circuit no longer oscillates. If this neutral point cannot be found it may be that the tickler coupling used is so "tight" that the detector is oscillating, or the coupling between the primary and secondary of the detector coupling coil may be too great. By loosening both the primary and tickler couplings the R.F. circuit can easily be neutralized. Then the primary of the detector coupling transformer can be adjusted to the position that provides best results and the tickler can be adjusted according to the suggestions given earlier in this article.

Once these adjustments have been made they will require no further attention unless either a new R.F. tube or a new detector tube is installed at some later date. In either of these cases a slight readjustment of the neutralizing or tickler coupling adjustments may be needed.

The operation of the receiver is like that of any two dial receiver. Stations will tune in and out as the dials are turned, without any accompanying whistles or other noises. After a station is tuned in the volume is readily controlled with the R.F. rheostat knob. Also, a given broadcasting station will always come in at the same point on the dials, and the dial settings of the various stations can therefore be "logged" for future reference.

On the whole this receiver represents an ideal set for any home. Its operating cost is extremely low. It is so easy to operate that even a child can work it at top efficiency. It has selectivity, volume, fine tone and sensitivity. And what is perhaps most unusual for a four tube receiver, it operates extremely well with a small antenna or even with an indoor antenna.

An interesting example of the adaptability and all around usefulness of this little receiver is found in the following news item regarding the yacht "Siren," winner of the 1927 Mackinac Cup-Races:

"We had been doing considerable off-shore cruising in our 44-foot racing sloop during the summer. About every second week-end our racing schedule took us across Lake Michigan to one port or another and during these long trips, especially with light winds, the

time hung rather heavy on our hands, as our only source of diversion was a small tin-pan phonograph.

"It was decided to equip the boat with a radio set which would combine fine tone and good selectivity, and above all sufficient sensitivity to permit the use of a poor antenna system. Such a set had to be designed to consume little filament current because it would have to use the storage battery which supplied our boat's lights and there were no facilities for charging this battery while under way. 'B' current consumption must be low too, so as to permit the use of the smaller sized 'B' batteries.

"The antenna requirements were the most difficult. The only way to erect an antenna was to suspend it from the spar and run it down through the deck to the receiver. This meant that the antenna wire would be surrounded by the steel cables of the rigging, most of which were grounded to the keel and therefore acted as a very capable and highly undesirable shield. There was no choice in the matter, however, so we had to be satisfied with this arrangement—and build a receiver with such a high degree of sensitivity that it could overcome the obstacle of a highly inefficient antenna.

"We decided upon the Knickerbocker Four receiver as one which would meet our requirements and, we hoped, would provide the required amount of sensitivity. It was built and installed shortly before the Mackinac Cup Race, the longest fresh-water race in the world. We were most agreeably surprised by the results obtained not only in the sweet tone quality but in the ability of the receiver to penetrate through the barrage of local Chicago stations and bring in distant stations.

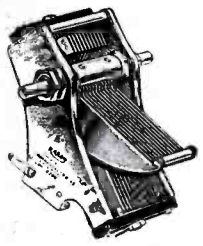
"Needless to say the Knickerbocker Four accompanied us during our participation in the Mackinac Race. Constantly during the race (at 300 miles as readily as at the start) we were able to receive the weather reports broadcast by KYW giving us the weather conditions at the various points on the lake. We were able with the aid of these reports to anticipate the weather conditions. There is no doubt in any of our minds but that the information received over the radio was a great factor in our success and strategy in navigation which resulted in our winning of this famous fresh-water classic. The constant reports we received indicated consistent wind and weather conditions over the entire lake and we were therefore able to lay a course to Mackinac which contained only five compass courses instead of the twelve variations ordinarily adhered to."

2-DIAL KARAS EQUAMATIC

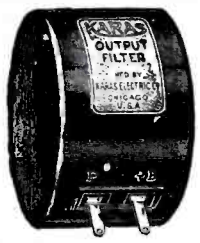
The Perfectly Balanced and Completely Neutralized 5-Tube Receiver De Luxe

2-DIAL KARAS EQUAMATIC USE KARAS PARTS KNICKERBOCKER "A"

2 Karas Type 28 Audio Transformers are used in the 2-Dial Equamatic. Price, each . $8.00

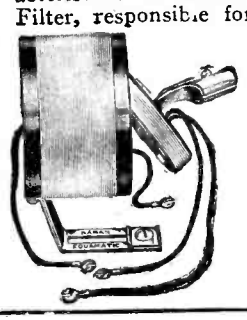


3 Karas S. F. L. Variable Condensers, with removable shafts, are used in the 2-Dial Equamatic. Price, each . $5.25



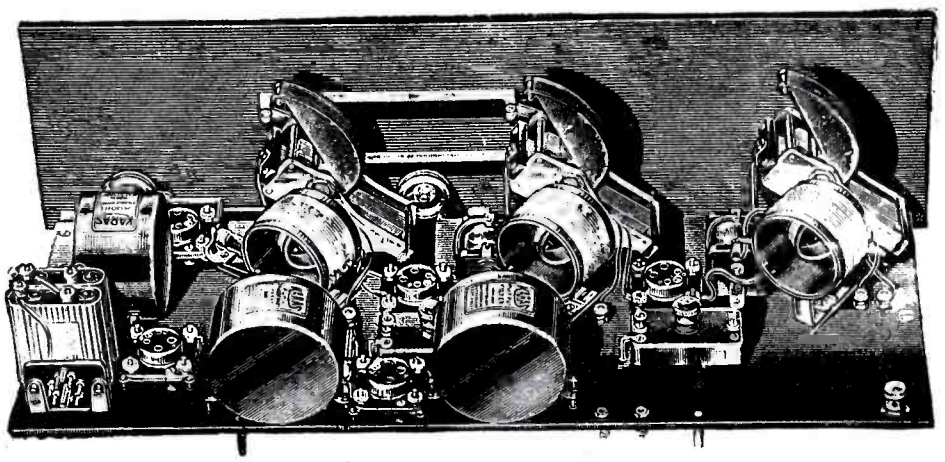
The new Karas Output Filter, price $8.00, is used in the 2-Dial Equamatic.

NO receiver ever designed offers you greater volume, distance, selectivity and simplicity of operation from five tubes than does the NEW 2-Dial Karas Equamatic. Here is a five-tube circuit, controlled by but two dials, that has been so perfectly balanced and completely neutralized that it is not a task but a real joy to operate the receiver under any and all conditions. You do not have to be an expert to tune this receiver, any more than you need to be an expert to build it. The panel is but 24 inches in length. The Karas and other parts are compactly assembled, insuring short leads, ease in building, and more perfect results in operation. And due to the utilization of the famous Karas Equamatic principle the energy transfer between primary and secondary of each Karas Equamatic Inductance Coil is constantly, automatically and positively maintained at every wave length setting of the dials. There are so many splendid features about the 2-Dial Karas Equamatic that we might devote several pages of this magazine to a description of them, and still not cover all of them. For example, the 2-Dial Equamatic employs two of the New Type 28 Karas Audio Transformers, giving superb volume. It utilizes 3 New Karas S. F. L. Variable Condensers, with their marvelous straight frequency line characteristics. It utilizes the New Karas Output Filter, responsible for its clear, sweet, pure tone. And Karas Inductance Coils and Micrometric Dials combine to give perfect, hair-line precision tuning at all broadcast wavelengths.



The Karas Equamatic Inductance Coil is the heart of the 2-Dial Equamatic. Per set of 3 coils, $12.00

2 Karas Micrometric Vernier Dials give 1/1000th of an inch regulation to the 2-Dial Equamatic. Price, each, $3.50



Build This Marvelous Receiver Today!

See your dealer today about the necessary Karas and other parts you will require in building the 2-Dial Karas Equamatic. Plan to build this receiver at once, so that you may enjoy the perfect reception it gives, plus its marvelous simplicity of operation. To secure full size blue prints and all necessary wiring instructions you have only to fill out and mail the coupon below. Do this today. All of this material will be mailed you FREE on request.

The "Hot Spot" Fourteen

(*Continued from page* 105)

by means of transformers. The design of these transformers is such that three may be used without any of the instability and tendency toward audio oscillation usually encountered where this number of transformers is used. So stable is this amplifier that it requires no doctoring with shunt condensers, shunt resistances, etc.

Across one of the secondary windings a variable high resistance is employed. This is not in the way of "doctoring" but is for use solely as a volume control. To a certain extent the potentiometer which controls the grid potential of the intermediate amplifier tubes also serves as a volume control. However the main purpose of the potentiometer is to provide a control over sensitivity and for that reason a separate volume control is considered desirable. This resistance across the secondary of the second audio transformer, T13, serves this purpose and is mounted on the front panel of the receiver where it is readily accessible.

The quality of reproduction obtained from this receiver is indeed pleasing. This is largely accounted for by the design of the audio transformers which differ considerably from the fundamentals employed in the more usual transformer design.

Of the fourteen tubes employed in the receiver, eight are of the CX-299 type. These are the eight intermediate-frequency amplifier tubes. Tubes of the CX 301-A type are employed for the oscillator, the two detectors and the first two audio stages. In the last audio stage either a 112 or 371 type may be used. The latter is to be preferred because of its greater power handling ability.

In spite of the large number of tubes employed the filament current consumption for the entire receiver is only 2¼ amperes at 6 volts. This is not an inconveniently large drain and a storage battery and trickle charger combination will be adequate for the supply source. A ½ ampere trickle charger will keep the battery charged if the receiver is employed not more than four hours per day. If used more than this, a charger with a proportionately higher rate should be used.

The "B" current consumption is also surprisingly low for this large number of tubes. It runs about 35 milliamperes under normal conditions. This is increased somewhat if a power tube such as the 371 is used in the last audio stage.

The filaments of the six 5 volt tubes are regulated through the rheostats R1 and R4. These rheostats need be ad-

justed only once and thereafter may be left untouched. The eight 3 volt tubes are served through a fixed resistance and rheostat connected in series. The purpose of the fixed resistance is to prevent the voltage on these filaments from going over 3.5 volts, even should the rheostat be turned up full.

The filament supply for the eight intermediate amplifier tubes is the only variable one, and for that reason the rheostat in this circuit, R3, is the only one included on the front panel. R1, R2 and R4 are mounted within the receiver, on the sub-panel. As an aid in maintaining the 3 volt tubes at the normal filament voltage the voltmeter M1 has been included on the front panel. This meter also shows the total "B" voltage applied to the receiver. To permit the operator to keep a visual check on the action of the receiver at all times a milliammeter with a range of 0 to 100 milliamperes is also included on the front panel.

The assembly of the receiver, and the wiring, are both surprisingly simple, considering the complexity of the circuit and the number of tubes used. All of the transformers and the tubes are mounted on a sub-panel and this sub-panel is completely wired up before it is attached to the front panel. The careful attention put into the design of the layout has resulted in much saving of time and labor. About half of the connections between instruments on the sub-panel do not require any wire at all but instead are completed by means of soldering lugs alone.

All of the connections leading from instruments on the sub-panel to instruments on the front panel are made to terminate in soldering lugs at the front edge of the sub-panel. This permits the complete wiring of the sub-panel as a unit. Then, after this sub-panel has been mounted on the baseboard, connections are run from these terminals to their eventual destination on the front panel.

It will be noted that all of the wiring is done beneath the sub-panel. To make this possible the mounting screws of all the instruments on the sub-panel also serve as connection terminals, thus extending all of the terminals through the panel without the necessity for bringing any of the wiring through to the top.

The illustration will give an exact idea of the location of the various instruments and of the construction as a whole and there should be no difficulty whatsoever in following this layout. In the wiring of the sub-panel it is well to wire all the plates and grid circuits first and follow these by the filament bus lines which extend nearly the whole length of the panel. If this wiring has all been kept down close to the sub-panel there will be plenty of room for the other miscellaneous wiring, without any chances for short circuits, etc.

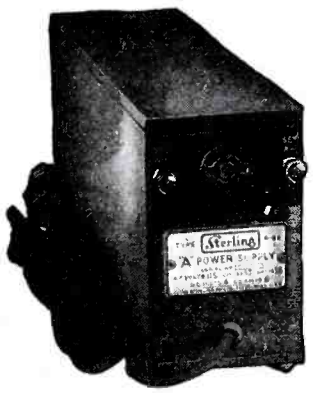
Electrify *Your* Radio Set!

the Sterling way-

"B" Power R-81

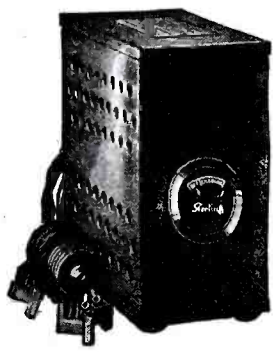
For 3- to 8-tube sets, including power tube. Output at 40 mils. is 160 volts. All three voltages, Detector, Medium and High, are adjustable within wide limits. On and Off switch. List Price, including Raytheon BH tube—

$28.50



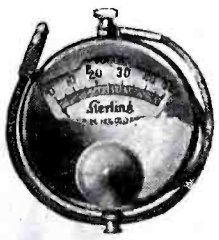
"A" Power R-94

For Radiolas and other 4-volt requirements. Also two 6-volt "A" Power Units.



Double Automatic "A" Battery Charger R-109

Starts when battery is low, stops when battery is full.



Sterling Pocket Meters

For every radio need—ammeters, voltmeters, voltameters.

–for TONE that will AMAZE you
–for POWER that is PERMANENT

YOUR set may give you good results when batteries are fresh and strong, but its performance will reach new heights when it is operating by Sterling full-powered "A" and "B" units connected to your light socket. And, it will be *always* ready.

For as little as $28.50, you can now equip your set with the improved Sterling "B" Socket Power Unit that not only does away with "B" batteries, but, because of its added feature of *exact current regulation,* brings out far finer tone quality than is obtained with the fixed units of "B" battery power.

Likewise, a Sterling "A" Socket Power Unit brings you steady, never failing "A" filament current. With these Sterling "A" and "B" Socket Power Units, complete control is reduced to one single switch.

Investigate Sterling Power Units. Hear the difference they make to reception, then think of the freedom from battery bother that will be yours when you install them. Remember, Sterling Power Units are backed by 21 years of electrical reliability and experience —your assurance of quality products throughout.

A Sterling Demonstration will be a Revelation. Your Dealer will prove it.

Sterling
Socket Power Units

THE STERLING MFG. COMPANY, 2831 PROSPECT AVE., CLEVELAND

Raytheon *Light-Socket Your Set the Sterling Way*

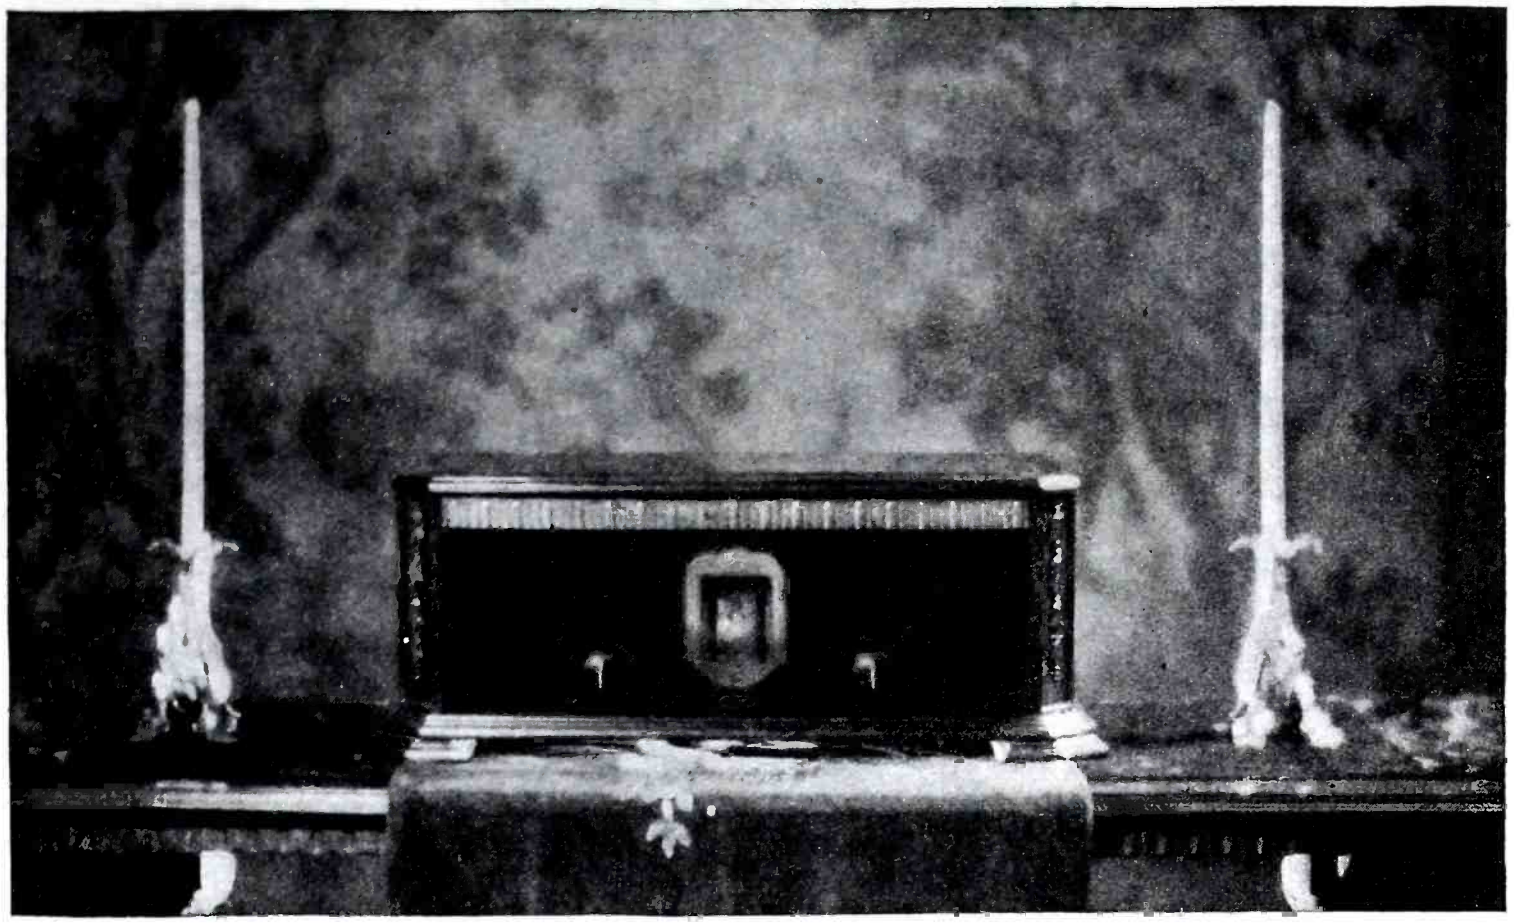
The operation of the receiver is like that of any other super-heterodyne. The fact that it has more intermediate frequency stages makes no difference in the tuning. All tuning is accomplished by means of the two vernier dials, the oscillator tuning on the left and the loop tuning dial on the right. Between these is found the knob which controls the amount of regeneration employed in the loop circuit. This latter is readily regulated as needed and when a high degree of regeneration is used there is a noticable increase in the sensitivity and volume, particularly on very weak signals. For local reception this regeneration control can be turned to minimum, of course, as there is no need for employing this feature except in the case of most difficult, distant reception.

The three knobs to the right of the tuning controls are for sensitivity, volume and intermediate amplifier filament control. These are used for the purposes indicated by the foregoing designations.

The source of power supply for this receiver may be the same source that would be used for any other good receiver. The "A" battery and charger have been mentioned above. The "B" supply may be obtained from batteries or from an eliminator. The latter is to be preferred, particularly if a 371 type power tube is used in the last audio stage. It will be found that a "B" eliminator is more economical than batteries.

The receiver is designed for use with a loop antenna exclusively. The sensitivity is so great that there is no occasion to use an antenna of any other type.

When this receiver is finished and mounted in a neat console or cabinet, it is an instrument of which the builder or owner may well be proud. Not only insofar as appearance goes, but also because of its extreme efficiency; its ability to step out and haul in those distant stations.



The New Improved Hi-Q Six—the creation of ten foremost American Radio Engineers — a receiving instrument that is far in advance of its time.

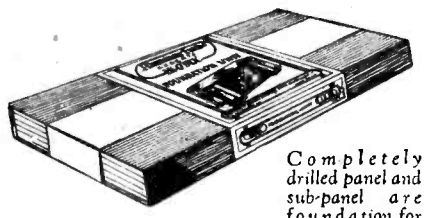
Exclusively CUSTOM-BUILT

By Yourself at Home . . . from our Simple Instructions . . . and at Great Savings!

No ordinary standards can be applied to this latest improved Hammarlund-Roberts Receiver, for it is the result of a determination to produce America's very finest instrument—absolutely regardless of cost!

Every modern constructional feature has been incorporated. Each part is the most efficient known to radio science, and the entire group has been purposely selected for perfect synchronization.

Complete isolation of four tuned circuits plus Automatic Variable Coupling effects maximum and uniform amplification over the entire wave band. Distortion is totally eliminated. Oscillation is utterly absent. Symphonic transformers and a power tube faithfully reproduce the full musical scale. Selectivity, even in crowded areas, is something to marvel at. And tonal quality simply MUST be heard to be appreciated!



Completely drilled panel and sub-panel are foundation for easy building.

Such a set, factory made, and sold through usual channels, would possibly cost around $300.00, but, through following our simple instructions, you can purchase all parts for only $95.80 and build this supreme receiver yourself — a CUSTOM BUILT set which gives you CUSTOM BUILT results at a saving of $100 to $150.

Get the complete Hi-Q Instruction Book from your dealer—or write us direct. Price 25 cents.

How to Build the Intertrol Five

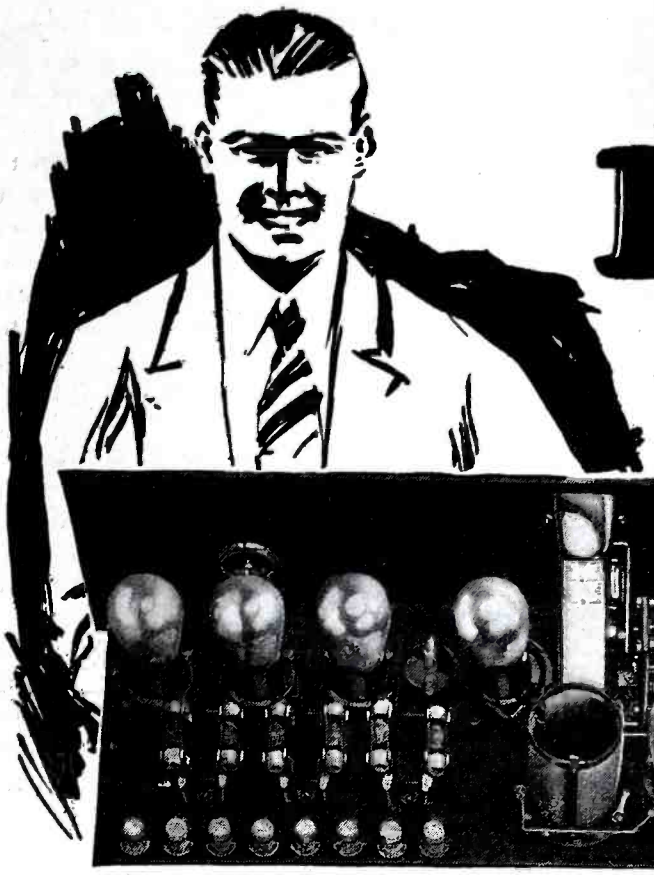
(*Continued from page* 116)

each end of the panel. These give the exact position of the shielding and in turn the shielding gives the height of the condenser shaft holes. The brackets are next fastened. Then the sockets are mounted on the sub-panel. The sockets located within the shields are raised about 7/8" above the sub-panel, using 1¼" machine screws. Lock nuts are used to hold the sockets at the desired position. Raising these two sockets prevents the possibility of a short-circuit through the bottom shields and in the case of the detector tube, gives an additional cushioning effect. After mounting all the sockets, the transformer, audio chokes and 30 henry choke are mounted. Next the R. F. chokes are put in place and the fixed condensers are mounted. The Variodenser and the by-pass condensers are also mounted at this time. The Amperites are then placed directly in back of the sockets. The next step is to center punch and drill holes in the panel for the variable condensers, two switches and variable resistances. The two variable condensers with their auto-couple coils are securely fastened to the panel, using two flat-headed screws for each condenser. The grid by-pass condenser is fastened horizontally to the variable condenser, as shown in the top-view illustration. The grid leak is mounted above the grid condenser by means of clips provided for this purpose. The binding posts and the tip jacks are then mounted. Finally the condensers C_5, C_7 and C_9 are fastened beneath the panel and also the cable mounting, CM.

In wiring the set, flexible Acme Celatsite is used, all wiring being done beneath the panel, as far as possible. Kester rosin core solder is recommended for all soldering. After the wiring has been completed, the dials are fastened in place and the set should be put in the cabinet to protect it from dust or possible injury.

If the "Intertrol Five" is to be used with ordinary "B" batteries instead of an eliminator, resistance R_{10} is not required, and in fact should not be used. R_{10} prevents motor-boating where an eliminator is used.

The secondary of the auto-couple coil L_1 is shown connected to A—. This is correct, where a special detector tube is used, but if a general purpose "A" type tube is used at V_2, the connection should theoretically go to A+ instead of A—. In actual practice, however, there does not seem to be much difference, except that there is a slight reduction of volume when the A— connection is used with the general purpose tube.



AERO-SEVEN RECEIVER

10-Kilocycle Selectivity

Utilizing New 340 Tubes

Electric, A. C. or Battery Operation

THE Aero-Seven Receiver, which is being featured in the prominent radio magazines and newspapers, is a new tried and tested tuned R. F. circuit, incorporating the most modern radio improvements at a popular price. It is a distinct innovation in a tuned R. F. receiver, utilizing three stages of R. F. and three stages of resistance-coupled audio. Circuit is built around the famous improved Aero Universal Coils, with improved Amsco S. L. tuning 3-gang condenser, S-M single-control drum dial and the tried and tested parts of other famous manufacturers. Such names as Carter, X-L, Westinghouse, Aero, Amsco and Silver-Marshall assure you of a circuit that is the final word in perfection.

Distinct features are: the new Hi-Mu tube at input and in R. F. stages, potentiometer control, higher amplification, 10-kilocycle selectivity and true single control.

The Aero-Seven requires no shielding as with the small Aero coils, direct pick-up is negligible and coupling between coils is the very minimum. The coils are twice-matched at both high and low frequencies of the broadcast band, thus eliminating many difficulties in single dial control and overcoming one of the principle causes of disappointments.

The adjustable compensators on the Amsco condensers facilitate the equalization of circuits, solving the major problem of tandem tuning.

The extremely sharp selectivity of the Aero-Seven circuit is due to the low resistance of the coils. The high voltage gain per stage, due to the extremely low loss construction, assures extreme distant reception and greatest volume and sensitivity is assured through the high efficiency of the coil windings.

New and Unique Hookup 3 Stages of Radio Frequency 3 Stages of Audio Amplification

The Aero-Seven has a new and unique hook-up that incorporates three stages of R. F. and three stages of Audio. There are two stages of tuned radio frequency and a special coupling stage, the secondary function of which is to prevent antenna detuning, thereby giving single control which is both theoretically and practically perfect. This independent antenna circuit is of a new and efficient design and employs a resistance connected between the antenna and ground inputting to the first grid circuit. Five CX340 tubes are used—3 in the R. F. circuit, one detector and one in the audio.

In the three audio stages, one 171 power tube is used, one 201A tube and the one CX340 tube in the input.

The circuit, therefore, is different from the usual 7-tube R. F. circuits, which variations contribute to its optimum selectivity, perfect quality and thrilling volume.

The combination of all the various parts, the matching of the Aero Universal Coils, together with the Amsco compensating 3-gang condenser, with true single control and potentiometer control, greatly simplifies operation and tuning, while adding efficiency to the circuit.

First Use of New CX340 Tubes— 1-6/10 Times Better

Utilizing the new CX340 Cunningham tubes in place of the usual 201A, gives the Aero-Seven the distinction of being the first circuit using this superior method. CX340 tubes are 1-6/10 times more effective than 201A tubes, having a 5-volt filament and .25 amperes; plate, 180 volts maximum. In this receiver 90 volts is used constantly on the plate for the R. F. circuit, something seldom attempted but efficiently worked out here. It is a High Mu tube, having a high amplification factor (Mu-30) and is used both as a detector and as a radio and audio amplifier. The Aero-Seven is specially designed to operate with this new and better CX340 tube and the results secured will be a pleasing revelation to you. It is surprising what tone and volume is secured with a minimum use of current.

Resistance Coupled Audio Amplification

Resistance coupled audio amplification in the Aero-7 attains a quality of reproduction unapproachable in other systems. It preserves the extraordinary quality consistently achieved by Aero-7's 10-kilocycle selectivity.

10 Kilocycle Selectivity Now a Real Fact

Ten kilocycle selectivity is OPTIMUM Selectivity. It means a receiver that tunes sharply enough to eliminate interference and yet does not tune so sharply as to cause distortion. It is the ideal tuning characteristic. "Optimum tuning," says the engineer, when he means a perfect set.

Why bother with anything but the best? Why put up with anything but 10-kilocycle selectivity, as represented in the Aero-Seven circuit?

Due to the low-loss construction of the coils and condensers in the Aero-Seven and the great selectivity introduced into the circuit itself, you get selectivity so sharp that you cannot get two stations at one time under present broadcast regulations, at the same time providing adequate frequency margin to prevent high "cut off"—distortion.

Imagine what this means in perfect radio reception. Selectivity, the ability to tune in clearly, sharply, without fear of disturbance in getting the station you want whenever you want it—that's something every radio fan has long desired. It is an actuality in the Aero-Seven—a feature that is necessary in an up-to-date circuit—a feature that you get in the Aero-Seven when you build it.

New, Modern, Proved Features in Aero-Seven

10 Kilocycle selectivity.
Resistance coupled amplification.
Uses new CX340 tubes instead of 201A.
3 stages of R. F.
3 stages of audio amplification.
Extreme D-X reception.
Potentiometer control.
Silver-Marshall single drum dial.
True single control.
Aero Coils are twice matched at both high and low frequencies.
Amsco adjustable condensers.
Carter resistances.
Westinghouse Foundation Unit.
X-L Posts.
High quality parts throughout.
Range below 200 to above 550 meters (1,500-500 KC).
Low loss characteristics throughout.

See article in this issue on the A C Model

Perfectly compensated—variation in antenna circuit doesn't affect it.
Wiring underneath sub-panel.
Simple construction.
Easy to build in quick time.
The most popular-priced 7-tube circuit.

The Aero-Seven-tube Receiver assures you of the very latest in radio. It has everything—beautiful tone, 10 kilocycle selectivity—extreme long range and a volume at your command that can be raised to music-hall proportion or lowered to slumbering whispers. The particularly meritorious application of resistance coupling creates a most remarkable tone. It gives you a receiver that is in a class all its own—a real conqueror of space—a companion that you can depend upon absolutely in any emergency. It delivers quality that is quality, and yet its construction is so low in cost as to be almost unbelievable.

An Opportunity for Set Builders

The set builder will find the Aero-Seven a most profitable receiver to build. It is an extremely simple circuit—efficient, high grade and having a record of exceptional performance. It could hardly be duplicated in a factory-built set at double the cost.

You can make big money building this set for your friends and get a real "kick" out of it yourself.

Complete parts, drilled and engraved panels and foundation units are being distributed through the jobbing trade and are available at leading radio stores everywhere. If your dealer or jobber cannot supply you, order direct giving your dealer's name and we will see that you are supplied promptly.

A booklet of assembly and operating instructions with complete data is furnished, which makes it both practical and easy to build this circuit quickly. Build yours early—get the jump on the other fellow.

The Self-Shielded Six

(*Continued from page* 124)

In addition to its high power-handling ability this amplifier provides excellent tone quality and does not require the high voltage used with resistance coupling; moreover, the volume obtained with the three stages is tremendous. An output filter is included in the plate circuit of the last tube to protect the loudspeaker winding from the heavy power tube plate current. The three audio tubes receive their filament supply through a single automatic filament control unit and a separate unit of this type is provided for the control of the detector tube.

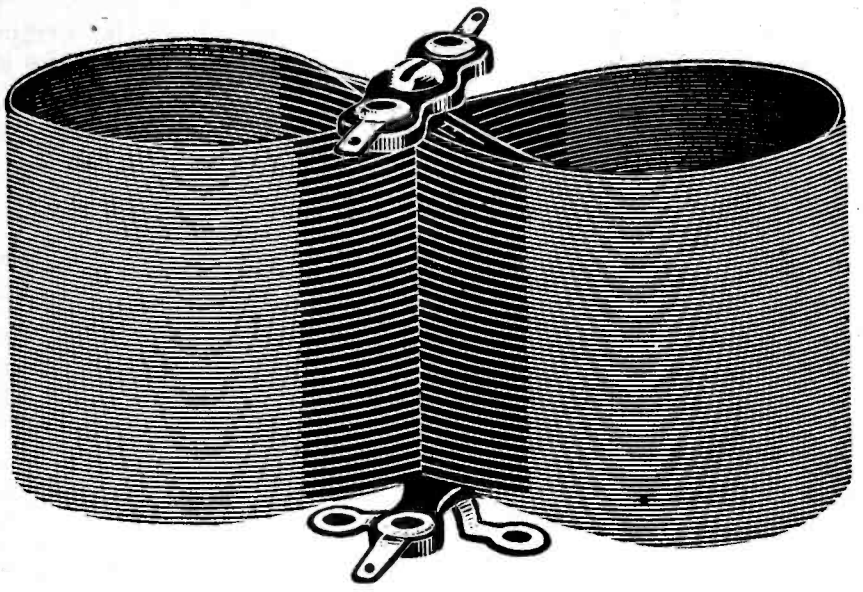
The baseboard layout diagram will give all the information necessary to duplicate the model Self-Shielded Six receiver previously pictured. It will be noted that the radio-frequency and detector portions of the receiver occupy the whole front of the baseboard. This permits wide spacing between the coils and thus decreases the possibility for undesirable interstage coupling. The first R. F. stage is located at the front right-hand corner of the baseboard while the second and third tuned circuits are located in the middle and at the left respectively. Thus the incoming signal progresses from right to left as it passes along to successive stages, until it reaches the detector. There it doubles back and passes through the three audio stages, winding up at the rear right-hand corner. The tubes in the row, leading from left to right, are: detector, 2nd R. F., 1st audio, 2nd audio and 3rd audio. The single tube toward the front is the 1st R. F. tube.

The coils, tandem condenser and tubes of the 2nd R. F. and detector stages have been laid out in a symmetrical position in an effort to keep the circuit values approximately alike. This is desirable because any great discrepancy between them would result in slightly different tuning and therefore poor efficiency from the tandem control system.

In wiring the receiver there are no special instructions to be given. It will probably be found best to first perform the wiring which necessitates wires running from back to front, and keep these wires as low down as possible. The terminal strips provided with the A. F. coupling units permit their connection directly to the corresponding tube terminals, which simplifies this part of the wiring. In general it is best to keep all wires as close to the baseboard as possible, except the grid and plate leads and these should be run as direct as possible, particularly in the R. F. circuits.

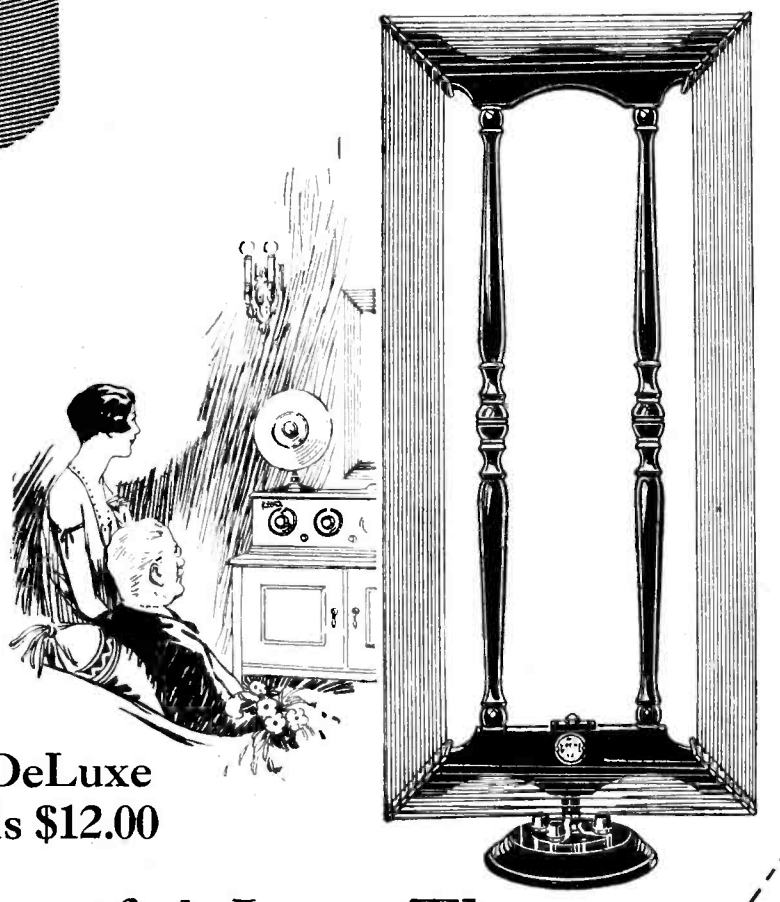
If the constructor studies the accompanying diagrams and photos, no difficulty will be experienced in actually wiring the set.

Twin-Eight Coils Specified for the Self-Shielded Six



Twin-Eight Coils
$2.00 Each
3 Matched Coils
$6.00

Tune out interference and secure great volume with marvelous tone quality.



All DeLuxe Models $12.00

Because of Amazing Selectivity, Stupendous Amplification, Unequaled Tone Quality

Due to the unique winding of Bodine Twin-Eight Radio Frequency Transformers, they provide outstanding selectivity with an amplification per stage heretofore undreamed of. Because of its self-contained magnetic field, losses due to interference from adjacent coils and other apparatus are avoided. Control of oscillation is quite simple even with three stages of tuned radio frequency. No energy is lost. Unusual selectivity also results from close magnetic field. The resulting sharp tuning adds a new thrill to radio reception.

Select a Circuit That Uses Twin-Eights

Bodine Twin-Eight Coils can be used with any T. R. F. circuit. Their selection for a circuit is evidence of the quality of the circuit itself. When you build a set, it is safe to follow the instructions of the man who recommends Twin-Eight Coils.

Rejuvenate Your Old Set

Replace the R. F. coils in your old set with Bodine Twin-Eight Coils. Enjoy the thrill of receiving long distance stations on the loud speaker.

A Beautiful Loop That is Remarkably Efficient

Today beauty is essential in a radio loop. The Bodine DeLuxe Loop combines harmonious beauty with remarkable efficiency and selectivity. The solid hand-rubbed walnut frame is a pleasing bit of exquisite furniture. The beautiful silk-covered winding harmonizes perfectly with the frame. The complete unit enhances the most artistically furnished room.

Brings in Long Distance Stations

The pickup of the DeLuxe Loop is thoroughly remarkable. It brings in long distance stations with great volume. It is a great aid in tuning and thus improves tone quality.

A unique feature of the DeLuxe Loop is a plug and jack mounting which permits it to be mounted on the set, thus eliminating trailing connecting wires. The loop may be rotated continuously in either direction without disturbing connections. Provision is made for keeping the wires taut so that the loop looks neat and attractive.

Order a Bodine DeLuxe Loop today. If your dealer cannot supply you, mail your order direct, enclosing remittance of $12.00, and specifying the capacity of condenser for which the loop will be used.

Chicago, Illinois.

Name .....

Address .....

A cable plug is used to provide all connections between the receiver and the batteries. The color code marked on the code tag which accompanies the plug is followed except that the black lead is used for the C— 40 volt connection instead of the ground and the brown lead is used for the B+180 volt lead instead of for the antenna. Binding posts are provided for the antenna and ground connections.

After the receiver wiring has been completed and checked the receiver may be set up for operation. Connect the cable ends to their respective terminals on the batteries before the cable plug is slipped over its mounting socket on the baseboard. Then insert a CX 300-A detector tube in the first socket from the left-hand end of the baseboard (looking at the receiver from the front). If the rheostat knob is now turned slightly so as to engage the battery switch which is incorporated in the rheostat, this tube should light to normal brilliancy. Then turn the rheostat knob all the way off in a counter-clockwise direction and insert CX 301-A tubes in all of the other sockets except the one at the extreme right, in which position a CX 371 tube should be used. Do not turn the rheostat knob on until all five of the other tubes are in position because unless both the R. F. tubes and all three audio tubes are in their sockets before the current is turned on, the tubes that are in place will be subjected to abnormally high filament current and may be damaged. For this same reason the filament switch should always be turned off when changing tubes around or when a tube is withdrawn for any reason.

The antenna and ground are connected to the binding posts provided at the right hand end of the baseboard and the loudspeaker tips should be inserted in the tip jacks provided on the same strip with the antenna and ground binding posts. The adjustment screw of the antenna series condenser C7 should at first be turned down as far as it will go without forcing.

The receiver is now ready to be put into operation. The rheostat is turned about half way to the right from the off position and the knob of the high resistance R4 is turned to the right as far as it will readily turn. Then the two tuning dials are rotated together until a station is heard, preferably one down around 35 or 40 on the dials. If a heterodyne whistle is heard instead of broadcast signals, turn the high resistance knob to the left until the whistle stops and at this point the signals from the broadcast station will be clearly heard. Then proceed to tune in several stations to get the "feel" of the tuning and operation.

It will be noted that volume can be controlled by either of the knobs which control R1 and R4. R4 should be set

Bremer-Tully Discard Old Standards of Comparison

THREE WINNERS

B-T Speaker Coupler Guarantees Improved Tone, Increased Volume, and Saves Speaker's Life.

Here's a real answer to Distortion,—the B-T Audio Coupler.

B-T "A" Transformer Makes a Power-Six "Electric"

Six Years' Success Back These New Products

Bremer-Tully have released a new product which should create world-wide discussion.

The old idea of "Amplification Curves" as a basis for comparing audio transformers has been discarded. *It never was anything more than a very secondary matter.*

B-T have always maintained that the real problem was "Harmonic Distortion,"—and—

Now *they have proved it* in the new B-T AUDIO COUPLER.

It is more than a transformer,—and better,—although no one has ever produced a better transformer than BREMER-TULLY.

A constant Impedance Core,—an air-gap,—Tertiary Loading Coil,—and finest laminations, combine to produce UNEQUALLED QUALITY in any product, regardless of size or price.

"Harmonic Distortion" has had practically no attention,—the attempts being to improve transformers by *increased size, cast cores,* etc. You can readily appreciate that BREMER-TULLY could not release this product if it was not superior.

Type 3-31 is for First Stage; Type 2-22 for second stage or for all stages where three stages are used,—as in replacing Resistance Coupling. Bring your set up to date with a set. Price each, $6.00.

Read more in BETTER TUNING—See Coupon.

BETTER TUNING is a booklet of 80 pages answering the latest questions in radio. Thousands praise it, and profit by it.

SEND THE COUPON.

once and should be left at that adjustment thereafter. To find its best adjustment, tune in a fairly distant station at about 300 meters and turn the rheostat knob about three-quarters of the way to the right. Then turn the right hand control knob until the receiver is just below the oscillation point. This will usually be the best position at which to leave this knob. Thereafter all control of volume and sensitivity is obtained through the knob of the rheostat.

The Light-Socket Operated World's Record Super Ten

(*Continued from page* 119)

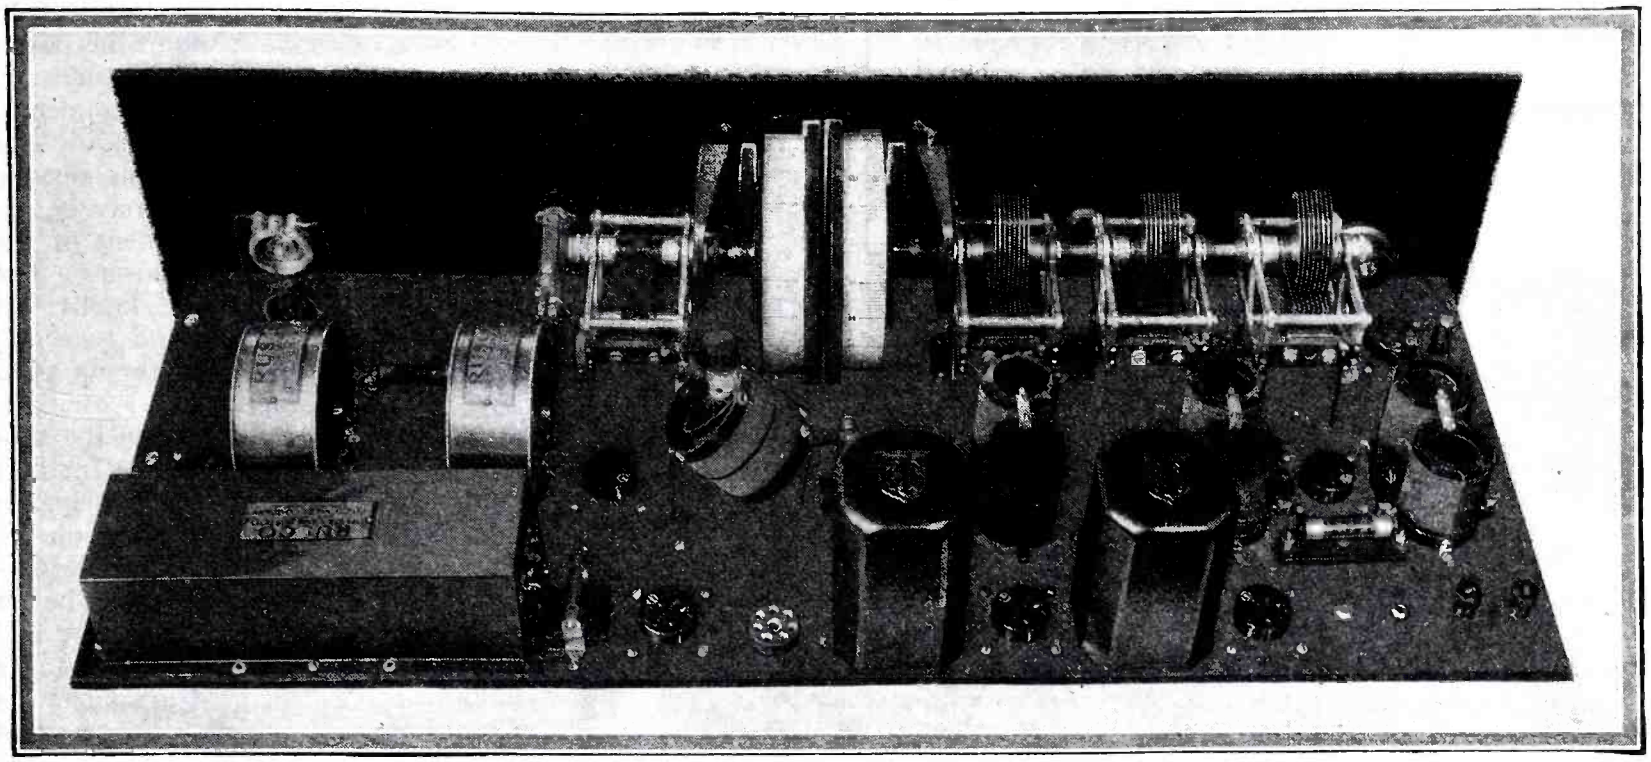
conjunction with a suitable condenser bank. Filament power for the CX 310 amplifier tube of the receiver and for the nine A.C. tubes is obtained from a special filament transformer delivering 4 volts, by means of 1.5 and 2.5 volt windings in series, and 7.5 volts. All of these parts are illustrated in the assembly view photograph herewith in which can also be seen the three low value resistances of the voltage divider, the larger 7,200 ohm resistance being fastened beneath the chassis. On the binding post strip are the six power unit connections, the left two being 4 volt AC, the next pair 7.5 volt AC, followed by B—, B+45, B+90, and B+450. No C bias taps are taken out as these are obtained through resistance drops either in the receiver or in the power unit itself.

This power unit which is 17½ inches long, 5½ inches wide, and 7½ inches deep, connects to the receiver by means of a Multi-Plug and cord and furnishes absolutely all power to the set, no batteries being required and the power unit operating only when the set is turned on.

The assembly of the receiver will be made clear by a reference to the drawings and photographs both herewith and in the previous issue of RADIO REVIEW. The assembly of the power unit is very simple and is well illustrated in the photograph and schematic diagram and should involve no special difficulties. The small Ward-Leonard resistors are mounted upon the chassis, using long machine screws and nuts, with fibre washers to keep them clear of the chassis. The larger resistor is mounted beneath the chassis by means of ¾ inch spacing collars and the dummy mounting lugs found at the extreme ends.

Once the receiver has been assembled, the testing and operation is very simple, indeed. The four A power leads of the Jones cable should be connected to the proper binding posts of the power unit, tubes inserted in the

Camfield Super-Selective "10"
2 DIAL CONTROL



Showing Complete Built-up Camfield 10 Receiver

CAMFIELD has again come to the front with a 10-tube super selective circuit of exceptional merit, possessing many features never before incorporated in a radio receiving set. It is a simplified receiver, having two easily operated drum dial controls. Another feature is that it may be operated as a six-tube radio frequency set, or as a ten-tube super selective receiver, by the simple turn of a switch on the front panel.

Again the famous Rusco Band Pass Filter in the intermediate frequency amplifier comes to the front as one of the most remarkable things in radio. This Filter is designed to pass a band of frequencies 10 kilocycles wide. The amplification over this band is uniform and the cut-off on either side is extremely sharp. The result is perfect selectivity between wave bands of only 10 kilocycle separation in the frequency. The uniform amplification over the band maintains perfect tone quality. The selectivity of this device is so perfect that it permits the use of radio frequency amplification ahead of the super and the operation of the set on an antenna, making it one of the most sensitive receivers ever developed. This makes possible the simultaneous increasing of both sensitivity and selectivity to a degree heretofore unknown.

This new circuit embodies all the latest improvements—simplified control by means of two Tyrman Drum Dials, Tyrman Audio Transformers, Camfield Condensers, Rusco Band Pass Filters and especially selected parts to make a perfectly balanced receiver of the highest quality yet available at a very modest price. It is easy to construct and simple to operate and will outperform any radio set you have ever used.

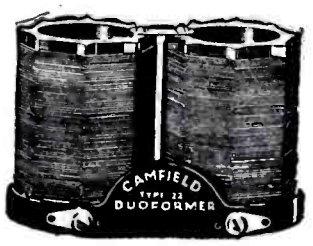
TYPE 22R DUOFORMER



Kit of Three Matched Duoformers, $10

The following features of the Camfield Equaltune Condensers are not to be found in any other one Condenser on the market:

1. To facilitate sharp tuning and perfect balancing in sets of the unit-control type, condensers are adjustable, which makes possible the perfect equalization of all circuits after the receiver has been completely wired. This eliminates use of vernier or trimmer condensers. Complete instructions and a special tool for making adjustment are packed with each double and three-gang condenser.
2. The shaft may be shortened or lengthened or entirely removed without affecting the adjustment of the rotor plates. This provides a simple means for connecting several units together with a single shaft anywhere from one to six condenser units may be operated with one dial.
3. May be mounted from either end by reversing the shaft cap nut and the panel mounting nut. After shaft cap nut has been removed, shaft may be extended from opposite end of condenser by loosening set screws on rotor hub.
4. A variable spring tension is provided and the rotor is mounted on ball bearings which insure extremely smooth running over a long period.
5. Beautifully finished. Rotor and stator plates are of bright dipped brass. All other parts are hand buffed and nickel plated.
6. A pair of special brackets for mounting condensers on base-board or sub-panel furnished at a slight additional cost. With the use of these backets, several single condensers may be mounted in a row on a base-board or sub-panel and all operated with a single shaft.

"A Tribute to a Leader"

Camfield Equaltune Condensers are the unanimous choice of discriminating manufacturers, jobbers, dealers and set builders. There is proof of this in the fact that they are being officially specified in the following circuits for the 1927-28 season:

Camfield Super-Selective 9 and 10.
The Tyrman Ten.
Madison Moore Super.
Madison Moore AC Operated Radio Frequency Circuit.
Citizens Super 8.
Camfield Duoformer 7.
Camfield Shield-Plate 7.
The New St. James U240.
Camfield Duoformer 5.
Thompson Super 7.
Hagerman's Organtone.
Dar-Mac Nine.
Strobodyne.
And Many others.

On actual demonstration the Camfield Super-Selective 9 will out-perform any other receiver. Its exclusive features mean real service and satisfaction to the man who builds his own. Do not pass up this wonderful opportunity. Set Builders in all parts of the country who have built the Camfield Super-Selective 9 are enthusiastic. We stand back of this circuit and are ready to help you in every way. If you have any special questions regarding this circuit we will welcome a personal call or a letter from you. Either will receive our immediate attention.

Send for free booklet, "Wherever You Require Quality," or get complete parts from your jobber or dealer.

receiver and power turned on (connections are made directly from the terminals of the voltmeter to the top heater leads of all Sovereign tubes, these heaters being connected in parallel). The rheostat in the receiver should be adjusted to give 2.75 or 3 volts on the Sovereign tubes which can be observed to glow slightly after a moment's operation. The CX 310 tube will light up. The remaining four connections may be made to the power unit, and the two CX 316B tubes inserted. If a loud speaker is connected to the receiver, the set is ready for operation, the two drum dials serving to tune in stations which may be intensified by proper adjustment of the small "Distance" condenser. The "Volume" and "Modifier" knobs will serve to control volume and tone and should never be turned so far up as to cause the RF amplifiers to oscillate. The 400 ohm grid rheostat on the subpanel should be adjusted once for best results on a weak station, bearing in mind that its adjustment reacts on the setting of the "Volume" and "Modifier" knobs. It should generally be set at approximately the half-way or 200 ohm position, and if a high resistance B eliminator voltmeter is available, the voltage across it should be measured and should be in the neighborhood of 1.5 to 4 volts for best operation, the proper value being determined by trial.

The La Peer AR-9

(*Continued form page* 111)

ate-frequency amplification, using this latter type of transformer, could be incorporated in a receiver an unusually high degree of sensitivity could be obtained. However, two stages seemed to be the maximum practical limit because more than this made the receiver unstable. The resulting regeneration in the intermediate-amplifier upset the whole receiver and made its operation unsatisfactory.

The La Peer intermediate-frequency transformers which have just been presented to the public under the name of the La Peer "D" radio-frequency coils seem not only to have attained this ideal but to go a step further inasmuch as no iron whatsoever is used in their core construction. They are coils of the air-core type and can be used in a three-stage intermediate-frequency amplifier and still provide perfectly adequate stability.

One reason for this stability lies in the fact that instead of having "scramble" windings as most transformers had in the past, or the honeycomb type of windings used in some transformers, the La Peer units are of the "D" coil type. That is, each turn of wire is in the form of a double

assemble the Ensco

"THE WORLD'S FINEST LOUD SPEAKER" in less than an hour

at a fraction of the cost!

The Three-Foot Pedestal

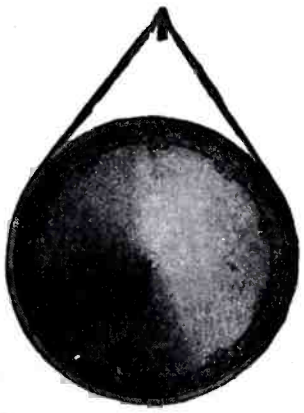
This new art model is beautifully finished in polychrome with a heavy metal base, making it practically impossible to tip over. Complete Kit, including pedestal. A practical, beautiful floor model.

Model F-175-36 .....$17.50
In Canada.....$22.50

The Two-Foot Pedestal

Equally as well made and as beautiful as the three-foot model, but smaller. Can be used on top of the set or on any other piece of furniture. Complete Kit including pedestal. Polychrome finish.

Model F-135-24 .....$13.50
In Canada.....$17.50



The Standard and Wall Models Two- or Three-Foot

The wall model kits are furnished with a hard wood wall frame for easy mounting. Made in two and three foot sizes.

The standard Kit is used for making console models and roll or book type speakers as described in instruction book—same as Wall Kit, but without frame. You can make your own wall frame if desired.

Standard Model, 2 or 3 feet
Either Size.....$10.00
In Canada.....$11.50
Wall Model, 2 or 3 feet
Either Size.....$11.00
In Canada.....$12.50

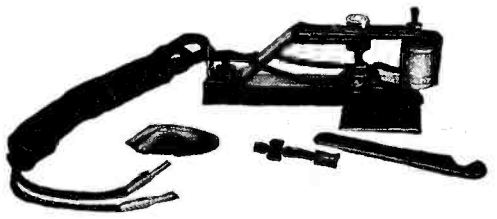
WHY pay a high price for a manufactured speaker when you can buy an "Ensco" Kit and assemble the "World's Finest Loud Speaker" at a fraction of the cost. No manufactured speaker, regardless of price, will give you any better reproduction.

The Simplest Cone to Assemble

The "Ensco" Single Cone is by far the simplest cone to assemble, no mechanical or radio knowledge is necessary. If you can use a pair of scissors, a screw driver and a pair of pliers, you can build the "Ensco" as perfectly as an expert mechanic. Within an hour from time you start work, you will be enjoying music, the like of which you never thought possible.

Compare— Let your Ear Be the Judge

Don't take our word for it. Go to your dealer, or any of the offices listed below. Hear the "Ensco" in competition with any speaker, no matter what the price. Then and only then will you know the difference between ordinary and "Ensco" reproduction.



The "Ensco" Unit

This is the heart of the "Ensco" speaker. It is the only direct-drive unit, which satisfactorily operates a 3-foot cone. It has no transmission arms or levers to reduce the motion of the armature.

The "Ensco" Unit is fully patented. Can be used with up to 250 volts without protection and up to 500 with an output system.

The bass notes, the foundation of all music come booming through in their true relation. The higher notes are equally free from choking or distortion. The tone is clear as a bell, without the slightest trace of mechanical noise.

Absolutely Guaranteed

The "Ensco" is backed by a guarantee that means something. All "Ensco" units are guaranteed to give satisfaction. After purchasing the "Ensco" Kit, you have ten days' trial in which you may test the speaker and return it if not satisfactory. Your money will be promptly refunded.

The Art Models

The first in the field, the "Ensco" is naturally the first to bring out Art Models. The beautiful pedestals must be seen to be appreciated, no picture could do justice to the handsome polychrome finishes. The "Ensco" is now available in two- and three-foot pedestals, which will make any woman glad to have them in her living room.

R.L.G.

D, with the flat sides of the D's toward each other. The result of this arrangement is a coil which has no external field. The lines of force circulate entirely within the coil winding and do not spread out to affect the coils in the other stages. In effect this type of coil provides practically perfect interstage shielding without the necessity for recourse to metal shielding. This limitation of undesirable interstage coupling naturally makes the amplifier unusually stable even with three stages.

Another unusual feature of the "D" coil transformers is that each transformer is individually tuned by means of a fixed condenser that is built into the transformer during manufacture. The purpose of this arrangement is to eliminate the element of doubt always present in obtaining exactly accurate fixed condensers of the required capacity in the open market, and to permit the accurate matching of the transformers at the factory without any possibility of this careful matching being subsequently upset during the assembly of the receiver.

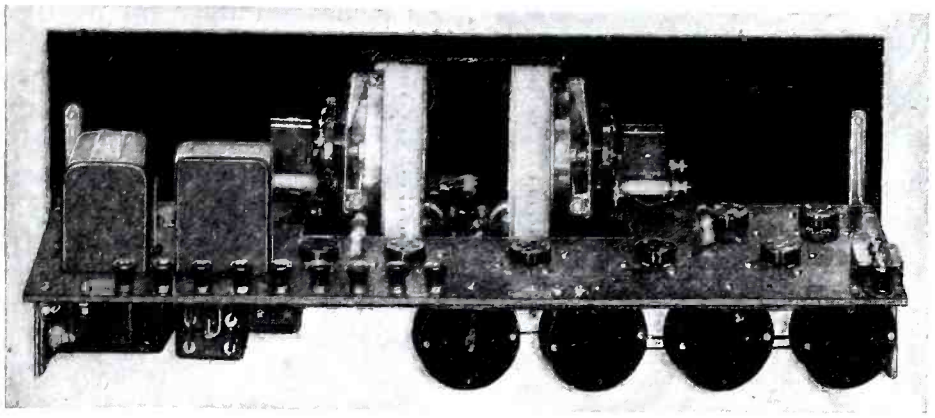
The design is also intended to cause each transformer to function as a ten kilocycle band-pass filter so that while it has a narrow resonance peak the curve will show a flat top. The purpose of this arrangement is to provide a high degree of selectivity but at the same time to prevent the selectivity reaching such a high degree that it will cut side-bands and thus cause distortion of the modulated signals.

With all this care taken to prevent distortion in the intermediate amplifier it is natural that the designers of the circuit for use with the "D" coils should follow this idea right through the detector and the audio-frequency amplifier. The use of a push-pull detector system is therefore an entirely consistent and logical move.

This detector system functions in much the same way as the push-pull audio amplification system with which most fans are familiar. The secondary of the detector input transformer has a split winding. The center tap functions as the common grid return for the two detector tubes while the extremities of the windings are connected to the grids of the two tubes, as shown in the schematic wiring diagram. The output of this dual second detector is obtained by connecting the plates of the two tubes in parallel and thence to the primary winding of the first audio transformer in the usual manner.

The employment of the push-pull idea is usually chosen for the sole purpose of preventing overloading of the tubes. Its use in this case is not for this alone however, but also to provide greater sensitivity to weak signals. It is frequently found that detector overloading is troublesome in receivers that provide an unusually high degree of

La Peer AR-9



New Construction Design

Main Parts Under Sub-Panel

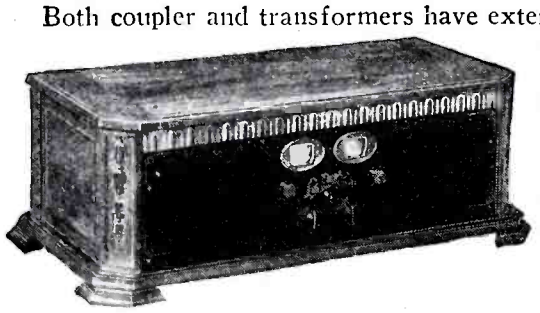
THE newest radio creation, the La Peer AR-9 receiver, is designed along new, scientific lines from parts of leading manufacturers, and embodying highly refined principles found in no other receiver. It has the appearance of a high class factory-built set and the performance of a radio engineering masterpiece.

The illustration above clearly shows why the La Peer AR-9 is different. Note that practically all the apparatus is mounted *underneath* the sub-panel, wiring thus being reduced to a minimum and leaving only the dials, condensers, tubes and audio transformers in view and keeping the R. F. transformers, wiring and minor apparatus hidden entirely, protecting these essential parts from handling, possible breakage and tinkering. Thus you have a complete set that looks and is clean cut, efficient and attractive.

Easiest Wiring Job on the Market

One of the really big surprises furnished by the La Peer AR-9 is the small amount of wiring required. This is due to the workmanlike sub-panel mounting. Most builders of multi-tube sets have a confusing maze of wiring to handle, whereas in the La Peer 9 about one-half the usual wire is used. Think of the greater stability this gives a set—and how much easier it is to build when direct connections can be made quickly and conveniently. There is a big saving in time and trouble.

Both coupler and transformers have extended grid and plate terminals which are connected *directly* to the terminals of the tube socket, thus assuring a direct, positive connection. The very heart of the La Peer AR-9 lies in the "D" shaped construction of the La Peer R. F. air core transformers. The windings are "D" shaped, the two "D's" facing each other and forming a closed magnetic circuit, assuring perfect selectivity and greatest amplification.



Showing built-up set in Fritts Cabinet

What "D" Coil Construction Means

"D" SHAPED construction means a completely confined field within the transformer itself, thus there is no effect on adjoining coils or circuit windings. These coils cannot be affected by outside influences or broadcast interference. The inherent shielding is so complete that you can place the La Peer AR-9 directly under the antenna of a high-powered broadcasting station and still not hear that station unless it is actually tuned in.

10 KC Separation

Another feature is that their low resistance and condenser tuned secondaries act as a 10 kilocycle band pass filter as well as an intermediate frequency amplifier. This produces hairline selectivity and perfect quality reception, powerful nearby stations being tuned out easily with one or two divisions of the oscillator dial.

Double Second Detector

Another interesting feature of the La Peer AR-9, found in no other receiver, is that the La Peer "D" transformers furnish a double second detector, because with their especially developed windings the exact center of the secondary coil is located and tapped. This tap goes to a grid bias of about 1½ to 3 volts. The "G" side of the transformer goes to the grid of the 1st tube of the 2nd detector and the "F" side to the grid of the 2nd tube. Thus the plates of both detector tubes are hooked in parallel and returned to the "P" of the 1st audio transformers.

There are no better parts and accessories to be had than those specified. The names speak for themselves: *La Peer, Remler, Silver-Marshall, Carter, Muter, Benjamin, X-L, Westinghouse Micarta* and *Fritts.*

Read the article in Radio Listeners' Guide and Call Book. Then build the La Peer AR-9 and enjoy reception of the highest order. Build now and you will forever be proud of this exceptional receiver. Your friends will wonder at its performance as much as you yourself.

***REMEMBER:* "YOU CAN BUILD BETTER THAN YOU CAN BUY."**

radio amplification and therefore anything that can be done to prevent this trouble is well worth while, particularly if the sensitivity of the receiver can be improved in so doing.

Actually a normally sensitive detector is all that is needed in a superheterodyne receiver because if an incoming signal impulse is so weak that, when built up by the three intermediate amplifier stages it still requires the use of a sensitive second detector, it is likely that the signal is too weak to be picked up at all. But the use of a "C" bias on the grid of the detector does decrease detector sensitivity and the use of the push-pull scheme is intended to compensate for this. The grid bias on this tube also helps to prevent overloading and is therefore an aid to the push-pull scheme; from which it appears that the two ideas, which are here incorporated in one receiver as far as can be determined for the first time, are mutually helpful and therefore are beneficial to the receiver as a whole.

A careful observer of the schematic diagram of the La Peer AR-9 receiver might be inclined to criticize the use of a grid bias on the first detector tube because the absolute maximum of sensitivity is required at this, the threshold of the receiver. In the first place this tube does not truly function as a detector, but this point need not be gone into. The important fact is that the first detector circuit is regenerative and any sensitivity lost through the use of the grid bias is more than made up for by the regenerative amplification obtained. So here again the grid bias makes for fine quality while another feature is added (regeneration) to maintain the sensitivity.

Passing on to the oscillator circuit, one might be surprised at the use of a grid leak and condenser in this circuit. This feature was included in the circuit by the designers to reduce the plate current consumed by the oscillator tube. It will have to be agreed that this is a laudable idea because even where the "B" supply voltage is obtained from a "B" eliminator it is always worth while to keep the current drain down to a minimum.

Little need be said about the audio amplifier. The Silver-Marshall transformers employed are generally conceded to be above reproach so far as their quality and degree of audio amplification are concerned. To handle the output of this combination a 171 type power amplifier tube is naturally the logical tube for the last stage. And the plate voltage for this tube should be not less than about 180 volts if best results are to be obtained, both in quality and volume. Many fans seem to have the idea that with a lower plate voltage there will be less tendency toward overloading. In the case of the

The Listeners' Accessory Guide

(*Continued from page* 130)

The advantages of this charger will appeal to the radio fan who has experienced the annoyance that comes from forgetting to switch his charger on or off, not to speak of the irksome necessity of fussing with switching-attachment plugs and improvised light-socket arrangements.

New 3-Foot Double Cone Speaker

The completed three-foot double cone speaker illustrated in the accompanying photos is furnished in kit form for home assembly and gives truly remarkable reproduction of tone.

In order to appreciate fully the simplicity of the design, the method of assembly is described in the following:

The parts included in this cone-speaker kit comprise a marked and decorated sheet of special paper for the front of cone, 38 x 38 inches; a marked sheet of special paper of the same size for the back of cone; the speaker unit; one back ring with latch, nuts, bolts and washers; edging braid; one cone apex assembly; rubber bumpers; adhesive tape; one loud-speaker unit mounting; and cement.

Illustrations courtesy G. R. P. Products Co., Inc.

The completed three-foot double cone speaker as it appears when completed.

The paper for the front and back faces of the cone should be removed from the mailing tube and flattened by

Thousands Use These Ingenious

TRANSMITTER UNITS

A marvel of engineering design—a practical miniature transmitter, used by thousands of radio fans and experimenters for amplification purposes.

Every amateur should have two or three of these amplifiers in his laboratory.

ENJOY LOUD SPEAKER OPERATION FROM A CRYSTAL

Everybody can do this now with a Skinderviken Unit.

The Skinderviken Unit is fastened to the diaphragm of the speaker unit. It will act as a "microphonic relay." Every time an incoming signal actuates the diaphragm, the electrical resistance of the microphone button will be varied correspondingly and the current from the battery, in series with the button and the loud speaker, will fluctuate accordingly.

LISTENING THROUGH WALLS

This Unit makes a highly sensitive detectaphone, the real thing—you listen through walls with ease. Plenty of fun and real detective work too.

CONDUCTING SOUND THROUGH WATER

Make yourself a miniature submarine signaling apparatus like those used during the war. Simple circuit with this microphone unit gives splendid results.

Send No Money—Just Mail the Coupon

THE SKINDERVIKEN TRANSMITTER UNIT

WE PAY YOU $5 for every new published use for this unit.

Experimenter - Capitalize your efforts! We Pay You for Your Work!

WE HAVE a Radio and Electric Unit that has been adapted to nearly 1000 uses. Its application to Radio, to Electrical phenomena and to many unusual and practical household uses is limitless. This Unit is essentially a very powerful amplifier in comparison to its size—it is also an efficient and desirable transmitter.

These units are, at the present time, used in numerous Radio Circuits, they are used for Radio Transmission, for Radio Amplification permitting the operation of a loud speaker from a crystal Receiver, for phonograph and loud speaker Amplification, for Stethoscopes, Detectaphones, Telephone Transmission, etc.

There still remain hundreds of undiscovered applications that can be developed by a little experimentation.

For every new use you develop for this marvelous unit which we accept and publish on this page, we offer $5.00 in CASH.

You don't have to know all about radio or electricity to win one of these $5.00 bills. To help you work, we send free with each unit a 12-page booklet which describes this simple unit in detail and illustrates with numerous diagrams many of its common uses.

Everyone has an even chance to win $5.00 or more. Waste no more time in experimentation. Make it pay you.

SEND NO MONEY

You need send us no money to get started. Just fill out the coupon below mentioning the number of units you desire. We will send them to you. You pay the postman 95c. each plus a few cents postage upon delivery. If you order two (2) you pay the postman only $1.75 plus postage. We include our 12-page booklet FREE.

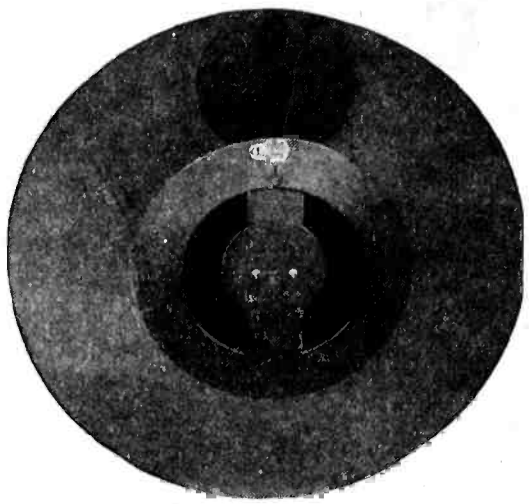
rolling them in the opposite way. In doing this great care must be exercised so as not to damage the paper by cracking.

The back sheet may be prepared by cutting along the solid lines with a sharp pair of shears. Next lay the paper for the front cone on the floor with



A back view of the three-foot double cone speaker showing the cut-out in the back cone and the latch on the back ring.

the decorated side down and cut out the V-shaped sector with a sharp knife.

When the two sheets have been prepared as described, place the front sheet on a smooth surface, such as a large table or floor, with the decorated-rough-side down, and place upon it the cut-out back bone, with the two smooth sides facing each other. Care should be taken to see that the edges of the back cone coincide with the dotted lines of the front cone; and the three arrow heads on the back cone, marked X, Y and Z, should meet those on the front cone. The two sheets of paper should be held in position with weights, such as heavy books, flatirons, or other objects with smooth surfaces, for the next operation.

At this stage of construction the two cone diaphragms are joined together with cement. With the forefinger of the left hand holding the back cone tightly against the front cone, so that the cement cannot seep between the two, slowly place a thin stream of cement around the circumference of the back cone.

The next step is to fasten the back ring in place. This is accomplished by spreading cement evenly over its outer ring, and then holding the ring in position with weights until dry. The back-ring latch may then be attached with brass bolts passed through the holes provided.

To form the cone, bring the two edges of the back ring together and close the latch (see photo of back view herewith). Lay the cone face down on a smooth hard surface, bring the two edges of the slit in the front cone tight up against one another and join them together on the inside of the cone with strips of adhesive fabric.

Before installing the speaker unit a small cone, about four inches in diame-

ter, should be made and fastened in the apex with cement, to reinforce the large cone, and then the apex piece is placed in position. The cross arm of the back ring should be attached and the loud-speaker unit mounted. The method of performing these four operations is obvious after examining the parts to be used.

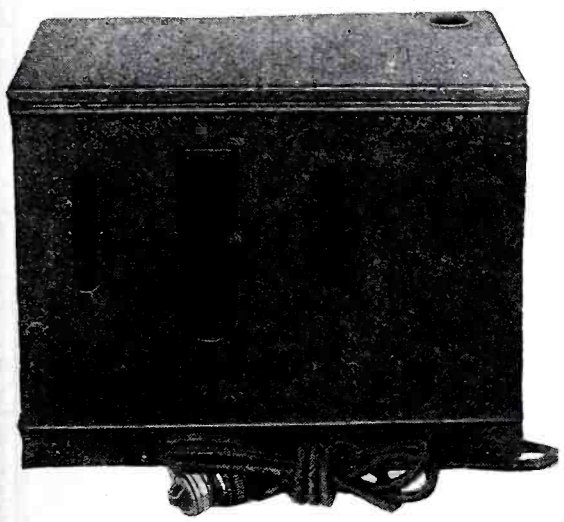
The finishing touches are made by screwing the rubber bumpers into the back ring, about three inches on each side of the back-ring latch, and fastening the binding braid around the circumference of the cone with cement—that is, half of it should be on the front and the other half on the back of the cone, and it should be held in position with clothes pins until the cement is dry.

When the loud speaker is finished it should be hung from a hook on the wall, about seven feet from the floor.

An "A-B" Socket-Power Unit

A complete "A" and "B" socket-power unit, capable of operating practically any radio receiver of from one to ten tubes, directly from an alternating-current lamp socket, is shown in the photo herewith. The device is exceptionally neat and compact, occupying little more room than is required by many storage batteries alone. The steel containing case is finished in an unobtrusive brown color, and over all is twelve inches long, eight wide and ten high. To install the instrument the radio set owner need only screw the attachment plug with which it is supplied into the nearest lamp socket or base receptacle, and then connect the "A" and "B" wires of his set to the binding posts provided for them on the terminal board inside the case.

This power-supply device, on the "A" side (which supplies the current that lights the filaments of the radio



Illustrations courtesy Briggs & Stratton Corp.

The socket-power unit as described herewith. The level of the electrolyte in the cells may be observed through the slots cut in the metal case.

tubes), employs a glass-jar storage battery which is charged during periods of radio-set idleness by an automatically - controlled, integral charging unit. Power is supplied to the radio receiver from the battery only; the A.C. house line is automatically shut off from the filament circuit during operation of the set.

The charger incorporated in the unit is not of the "trickle" type, but of considerably heavier current capacity. It is automatically turned on when the radio set is turned off; and the charging continues until the battery has been fully replenished. When the cells attain a condition of full charge the charger is automatically cut out of the circuit. A high initial charging rate is used, with a gradual tapering off in value as the battery voltage is built up. This arrangement is consistent with good battery practice.

The glass jar of the "A" battery being fully transparent, the user is able to observe the condition of the cells at all times; convenient observation windows for the purpose are cut in the side of the steel containing cabinet. Two colored balls which float in the electrolyte act as a form of hydrometer indicator, and simplify the checking of the battery's condition of charge or discharge.

A new feature introduced in this combination "A" and "B" unit is a special emergency switch, used only for reconditioning the battery after the latter has stood idle for a considerable length of time. Under normal operation conditions, a double-acting automatic relay switch operates the charger, this switch being actuated in its first stages of operation by the voltage of the battery lead to the tube filaments. However, if the battery is left standing idle over a period of months, with resultant weakening of the cells, the automatic relay is supplemented by the manual emergency switch. If this switch is turned on, the battery will be soon recharged and the former automatic operation then continues.

The "B" section of the combination power unit is of more or less familiar appearance, involving the use of the usual step-up transformer, gaseous-tube rectifier, filter condensers and choke coils.

THE FAMOUS STROBODYNE can be built at home with New Pattern See page 190

The La Peer AR-9

(*Continued from page* 164)

171 tube this is not so. The truth of the matter is that the full voltage of 180 provides the least chance for overloading; used with a suitable "C" bias, of course.

In the output circuit of the 171 tube a Silver-Marshall output transformer is employed to prevent the comparatively high plate current for the 171 tube from passing through the loudspeaker magnet winding. This is an important consideration because failure to use an output device will result in rapid deterioration of the loudspeaker and probable distortion of reproduction.

The construction and wiring of the La Peer receiver requires no written explanation. The photographs and diagrams tell the whole story. Inasmuch as the front panel and the sub-panel may both be obtained completely drilled, there are no preliminary panel layouts to bother with. The builder can go right ahead with the actual construction as soon as all of the specified parts have been obtained.

One of the outstanding features in the construction of this receiver is the method of mounting and wiring its component parts. The simplicity of this work makes it possible for the home set builder to reproduce a completed set that has every appearance of a factory built product. With the exception of the two audio transformers, and a few other small parts, most of the parts and wiring are beneath the sub-panel. Note particularly the method of mounting the intermediate transformers. The transformer terminals make direct contact with the tube socket terminals by means of mounting the transformers as shown in the illustrations.

When completed the receiver presents an impressive appearance. Practically all of the wiring is concealed from view, even when the cover of the cabinet is raised. The front panel is neatly laid out and conveys an impression of elegant simplicity. Of course the cabinet selected for the housing of the receiver will have a decided influence on the looks of the job and it is for that reason that great care in its selection is strongly recommended. The Fritts 7"x24" standard super cabinet was used for the model receiver and was found to fill the bill admirably.

About the only suggestion that need be offered regarding the operation of the receiver is in connection with the sharpness of tuning. It will be found that a station can sometimes be completely tuned out by turning one of the tuning dials only a part of one degree. It is therefore obvious that exact tuning is required to tune in stations.

Particularly when "fishing" for new stations, the tuning should be done slowly, otherwise stations may be skipped over entirely.

In all other respects this receiver tunes like any other two-dial receiver. All tuning is accomplished by means of the two knobs which are located just below the metal escutcheon plates which bear the tuning indicators. The two knobs below these serve to control volume and sensitivity. All of these controls are grouped in the center of the panel where they are handy and where the calibrated drums of the tuning controls can be observed at a glance without the necessity for constantly running the eyes and hands back and forth from one end of the panel to the other.

STATEMENT

Of the Ownership, Management, Circulation, Etc., Required by the Act of Congress of August 24, 1912, of RADIO LISTENERS' GUIDE AND CALL BOOK, a quarterly magazine, published at New York, N. Y., for October 1, 1927.

State of New York, } ss.
County of New York, }

Before me, a notary public in and for the State and county aforesaid, personally appeared S. Gernsback, who, having been duly sworn according to law, deposes and says that he is the Editor of the RADIO LISTENERS' GUIDE AND CALL BOOK, a quarterly magazine, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 411, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are: Publisher, The Consrad Co., Inc., 230 Fifth Avenue; Editor, Sidney Gernsback, 230 Fifth Avenue; Managing Editor, W. G. Many, 230 Fifth Avenue; Business Manager, Chas. E. Rosenfelt, 230 Fifth Avenue.

2. That the owner is: (If owned by a corporation, its name and address must be stated and also immediately thereunder the names and addresses of stockholders owning or holding one per cent or more of total amount of stock. If not owned by a corporation, the names and addresses of the individual owners must be given. If owned by a firm, company, or other unincorporated concern, its name and address, as well as those of each individual member, must be given.) The Consrad Co., Inc., 230 Fifth Avenue; Hugo Gernsback, President, 230 Fifth Avenue; Sidney Gernsback, Vice-President, 230 Fifth Avenue; R. W. DeMott, 230 Fifth Avenue.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is ..... (This information is required from daily publications only.)

S. GERNSBACK, Editor.

Sworn to and subscribed before me this 30th day of September, 1927.

[SEAL.] JOSEPH H. KRAUS.

Notary Public, Queens County Clerk's No. 985, Queens County Register's No. 2903, New York County Register's No. 9267, New York County Clerk's No. 317. (My commission expires March 30, 1929.)

The A. C. Operated Shielded-Six

(*Continued from page* 100)

rated receiver, the design of an A.C.-tube set depends upon an exact co-ordination of all parts, and substitution in even a small item may wreck the entire performance of the outfit. It is safe to change only such things as binding posts, sockets, and dials; while, of course, a choice of tubes is possible.

Should the builder desire to construct the receiver without the push-pull amplifier feature, the following substitutions should be made in the list: the push-pull transformers should be replaced by a 220 and a 221 standard transformer; one four-contact tube socket may be omitted entirely; and one of the 1000-ohm resistors should be changed to a 2000-ohm type. No other changes than these should be made.

Before the constructor begins the assembly of the receiver, all parts should be very carefully examined and inspected to make sure that they have suffered no damage in transit. Tubes particularly should be tested in the sockets for good spring contact; the R.F. transformers tried in their sockets; and the variable condensers most carefully scrutinized. All resistors should be tested with headphones and battery to make sure that they are not open-circuited. (The ¼-megohm grid leak will give only a very faint click in headphone test.)

To assemble the receiver, all parts should be mounted upon the chassis exactly as illustrated in the various pictures and diagrams, using 6/32 machine screws and nuts. The four coil sockets should be lifted above the chassis by means of ¾-inch hollow mounting studs and long screws. The three shield pans are placed as illustrated; but, before they are inserted in their place, two of them, as well as the two shield tops, must be cut away to make room for the rather large 6,000-ohm volume-control potentiometer. This potentiometer, using insulating washers to insulate it thoroughly from the front lip of the chassis in which it is mounted, should be slipped into position before attempting to fasten down the shield pans. The two central shield pans must have their adjacent front corners cut away slightly with a pair of heavy shears or tin snips in order that they may not touch the 6,000-ohm potentiometer. Similarly, the adjacent bottom front corners of the shield pans must be clipped away. This can be done with a pair of scissors, simply by cutting out a triangular section from the corner of each one; so that, when slipped into place, they will not short-circuit upon the volume-control resistor.

Don't Fail to See Page 186

Wiring

If all parts are mounted, the receiver should be wired with fabric-insulated hook-up wire. The fixed resistors R2, R3, R4 and R7 are mounted on the inside of the chassis with one end terminal of each grounded to the chassis and the other end terminals bent up free and clear of the chassis. The mounting screws of the sockets at convenient points are used to hold these resistors. The drawings show the exact location of these resistors. If desired, the wiring on the underside of the chassis may be left somewhat longer than is necessary, but grouped along common paths so far as possible so that all wires can be laced into one or two groups or cables after all wiring is completed.

Before the panel is put in place, the link motion should be attached to the three right-hand condensers, in such a fashion that, as one condenser is turned, the other two rotate with it. Care should be exercised to leave a space of at least 3/32 to ⅛ inch between the lock collars of the link motions and the variable condenser shafts; for in this space the stage-shield edges fit. The front panel is fastened to the chassis by means of the battery switch and antenna switch and the shaft bushing of the 6,000-ohm volume resistor; this last being insulated away from the chassis and panel with suitable insulating washers. The vernier dials are fastened upon the condenser shafts in such a fashion that they read zero with the condensers entirely unmeshed.

So far no connections have been made to the battery switch; though a 6-foot length of twisted loop cord should have two ends connected to its terminals, the cord running across the chassis and up through a hole in the bakelite terminal strip adjacent to the speaker tip jacks. The two free ends of this cord should later be spliced into one wire of the twisted pair joining the power transformer to an attachment plug, which must be inserted in a home-lighting socket. Thus the battery switch on the receiver panel serves to break one side of the lighting line to the power transformer and, with a single flip of the switch on the receiver front panel, automatically turns on or off all power for the set.

Power Unit Connections

The assembly of the power unit itself is very simple and is well illustrated in the accompanying view. The power transformer and condenser bank should be mounted upon the steel base, together with the two tube sockets and four binding posts; using insulating washers to insulate these posts from the steel chassis. All wiring should then be put in place, leaving

three leads for connection to the choke-coil unit, which is put in place last to avoid interference with connections 5, 6, 7, and 8 of the condenser bank. The voltage-dividing resistor is mounted by having its four lugs soldered to the ends of binding-post soldering lugs underneath the chassis. Care should be taken to see that the proper resistance values fall between the different binding posts. Four rubber feet are provided to raise the chassis from the table and prevent the scraping and marring of furniture.

To operate the receiver, it is necessary simply to connect the four binding posts of the power unit to the four similarly marked posts of the receiver terminal strip, and to connect the three filament windings of the power transformer to the six properly-marked filament binding posts on the receiver terminal strip. These connections should be made by means of a twisted No. 18 lamp cord; though, if the receiver is to be located more than two feet from the power unit, the connections of the 2.5-volt circuit should be of No. 14 lamp cord.

To operate the unit, the power-transformer plug should be inserted in the home-lighting socket and the rectifier tube placed in the inner socket of the power unit. If the voltage-regulator tube is placed in the outer socket, it should glow with a pinkish or purplish glow. The receiver tubes should be inserted in their sockets, the four CY-327 tubes in the five-prong sockets of the R.F. circuits, the CX-326 in the right rear socket, and the CX-371s in the left rear sockets adjusted to the output transformers. All of these tubes should light; and, as they are successfully inserted, the glow-tube brilliancy should vary somewhat as the filament control is turned from left to right. After current is turned on with all tubes inserted, it will be from 30 to 60 seconds before the receiver is ready for operation; for it takes this length of time for the heater tubes to come up to proper operating temperature. When they do, a considerable hum will be noticed in the loud speaker. Some of this hum should disappear with a ground connection attached to the proper receiver binding post; though it should still persist with the volume control turned half-way or fully around to the right.

The next step is to connect a wire to one side of the 2.5-volt heater lighting circuit; the other end of this wire is to be touched successively to the "B—," "B+45," and even "B+90" binding posts of the set. If this is done, hum will noticeably decrease and will practically disappear with one connection, which should be made permanent. Preference should be given to the connection between the 2.5-volt heater winding and "B—," or "B+45." If, however, the hum does not entirely

cease, an FT64 balancing resistor should be connected to the two 2.5-volt binding posts of the receiver and the center tap of this resistor connected to "B—" or "B+45." This done, the hum will be reduced to a value too low to interfere with reception.

Operation

The receiver may be operated by the connection of an aerial lead to the proper binding posts; the aerial itself may be anything between 20 feet of indoor wire around a picture molding and a 50- or even 80-foot outdoor antenna. Stations are tuned in by using the two large tuning dials, with volume adjusted by the volume-control knob.

If the volume knob is turned too far to the right, the receiver will oscillate and squeal; and in operation it should always be kept just to the left of the oscillating point. The set is most sensitive with the volume control adjusted to just below the oscillation point; though it may be, of course, turned all the way to the left to decrease the volume, as desired.

There are practically no trouble-shooting suggestions to be offered; for the receiver, if properly assembled and wired, will work without any difficulty. However, if any question arises, the power-unit voltage should be checked with a high-resistance voltmeter, and should show approximately the voltages marked on the binding posts, having from 200 to 220 volts maximum output with the receiver in operation. The glow tube should not extinguish in operation, though it will flicker as strong signals are received. The heater tubes will hardly glow at all when lit; though the small rods projecting through the internal assemblies will heat to about a cherry-red color after 30 or 40 seconds of operation. The 371 tubes should light to fair brilliancy; while the filament of the 326 will glow a dull red after 5 to 10 seconds of operation. If the tubes are believed to be defective, they may be tested, most satisfactorily by a dealer or service station. There is no reason, however, for anticipating even as much trouble with A.C. tubes as may be experienced with standard storage-battery types; for the electrical nature of the former is very much more rugged.

Grid Bias

tive potential is impressed on the grid. In this case the *characteristic curve* (q.v.) of the tube is assumed to indi-

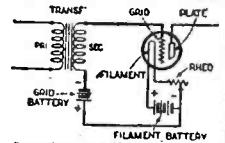


Fig. 1. Method of a 6½ volt battery to impress a negative potential on the grid of a vacuum tube.

cate that more difference in current occure between points B and C than between A and B in Fig. 2. For this

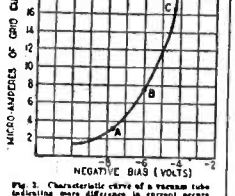

Fig. 2. Characteristic curve of a vacuum tube indicating more difference in current occure between "B" and "C" than between "A" and "B."

reason a negative potential is applied as shown in Fig. 1. (See *Grid Bias.*)

GRID BIAS—A potential of a few volts, generally from four to six, applied to the grid of a vacuum tube to influence its operation by making it more or less negative. The grid bias is usually negative and determines the point of the *characteristic curve* at which the tube will operate. In a sensitive receiver, and particularly where a tube is used as an *amplifier* (q.v.), it is essential to obtain as great a change of grid current as possible. (Note: The greater the change of grid current, the greater the change in plate current and hence the more powerful will be the output.) By applying a negative potential on the grid it is possible to hold it at the point of maximum response. (See *Grid Battery*, also *Vacuum Tube, Theory of Operation of.*)

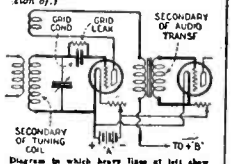

Diagram in which heavy lines at left show the grid circuit of the detector, while those on right indicate audio amplifier grid circuit.

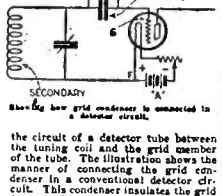
GRID CIRCUIT—In a receiver employing vacuum tubes, the part of the cir-

cuit containing the grid of the tube or tubes, but generally referring to the tuning circuit or that part of the system which contains the tuning elements. In the illustration is shown a standard arrangement of a regenerative detector and one stage of audio-frequency amplification. The heavy lines at the left of the diagram represent the tuning circuit or detector *grid circuit*, while the section with heavy lines at the right is the grid circuit of the amplifier tube. The grid circuit of a detector tube may generally be distinguished by means of the grid leak and condenser (so marked in the illustration), which controls the incoming signals and permits the tube to function as a rectifier. (See *Detector, Grid Control*, also *Grid Condenser* and *Grid Leak.*)

GRID CONDENSER—A small fixed condenser, generally from .00025 to .0006 microfarad capacity, inserted in



Showing how grid condenser is connected in a detector circuit.

the circuit of a detector tube between the tuning coil and the grid member of the tube. The illustration shows the manner of connecting the grid condenser in a conventional detector circuit. This condenser insulates the grid from the filament by breaking the path F to G and permits the tube to act as a rectifier or detector. A resistance (called *grid leak*) is usually placed across this condenser to allow the accumulated charges on the grid to leak off. (See *Grid Leak*, also *Grid Control* and *Vacuum Tube, Theory of Operation of.*)

GRID CONTROL—The general term used to designate the various devices and associated connections placed in or allied with the grid circuit of a vacuum tube for the purpose of controlling to a greater or lesser extent the potential of the grid, or to tune or control the incoming oscillations. In the case of a vacuum tube used as a rectifier (detector) the grid condenser and grid leak are placed in series with it. (Note: the grid leak is often connected from the grid directly to the filament instead of across the grid condenser, the operation, however, being approximately the same in either case.) Here the controls permit the tube to function as a detector of the incoming oscillations. Where the tube is used as a radio-frequency (high-frequency) amplifier, the radio-frequency transformer or other amplifying unit controls the grid of the following tube by influencing the fluctuating potential differences impressed on it. (See *Amplifier, Radio-Frequency.*) The most important example of a grid control is by using some means to control the potential applied to the grid, such, for example, as a grid bias or grid battery. (See *Grid Bias, Grid Battery*, also *Vacuum Tube, Theory of Operation of.*)

GRID CURRENT—The current present in the grid circuit of a vacuum tube. This is generally very small, perhaps of the order of fifteen to twenty *microamperes* (q.v.). (See *Plate Current*, also *Grid Bias.*)

GRID LEAK—A high resistance placed in the grid circuit of a vacuum tube to permit the electrons forming the grid current to leak off after each charge, thus preventing their accumulating on the grid in such numbers as to stop the flow from the filament. The electrons being negative, a surplus of them on the grid member of the tube would act as a barrier to the free flow of other electrons from the filament through the grid to the plate, thus diminishing the plate current toward zero. It will be understood that a heavy negative charge on the grid will repel a like or negative charge, in this case the negative electrons being thrown off by the hot filament.

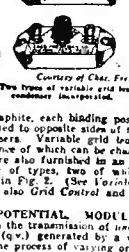
The grid leak may have a value ranging from about 250,000 ohms to several million ohms. The value of a grid leak is generally stated in *megohms*—one megohm being one million ohms. Thus a grid leak of 250,000 ohms resistance would be referred to as a ¼-megohm leak and, similarly, one having a resistance of two million ohms would be referred to as a two-megohm grid leak.

Such resistances are furnished in many forms, the most common being a strip of paper impregnated with graphite or some similar high resistance preparation, placed in a glass tube and sealed to prevent moisture from affecting the value. The illustration, Fig. 1, shows a tubular type of grid leak.

Courtesy of Chas. Freshman Co.

Fig. 1.—A tubular type of grid leak.

For experimental work a fairly satisfactory grid leak can be made by the simple expedient of drawing a line on a piece of cardboard with a soft pencil —the graphite mark acting as the resistance. At each end of the cardboard is placed a binding post in contact with



Courtesy of Chas. Freshman Co.

Fig. 2.—Two types of variable grid leaks with condenser incorporated.

the graphite, each binding post being connected to opposite sides of the grid condensers. Variable grid leaks, the resistance of which can be changed at will, are also furnished in an infinite variety of types, two of which are shown in Fig. 2. (See *Variable Grid Leaks*, also *Grid Control* and *Resistance.*)

GRID POTENTIAL MODULATION—In the transmission of *undamped waves* (q.v.) generated by a vacuum tube, the process of varying or modulating the potential of the grid element of the tube with respect to the filament. In this method an alternating potential may be applied to the grid circuit, the frequency of this varying potential being within the audio band —possibly about 500 cycles—supplied by a generator of that frequency. (See *Modulation.*)

GRID POTENTIOMETER—A potentiometer—a variable resistance unit—Fig. 1, used in the grid circuit of a vacuum tube for the purpose of controlling the potential applied to the grid. The conventional method is to place the potentiometer across the "A" battery with the center or variable contact arm connected to the grid of the tube in place of the usual connection to either positive or negative filament lead. This is shown in the illustration, Fig. 2. Here the customary circuit is

Courtesy of the Cutler-Hammer Co.

Fig. 1.—A type of potentiometer.

shown for the "A" battery to light the filament of the tube. Pri. and Sec. are respectively primary and secondary of the transformer (either radio-frequency or audio-frequency) and C the center arm of the potentiometer. The center arm may be moved either to the right or left, permitting either negative or positive potential to be applied to the grid. This system is much used in amplifying tube circuits to control the action of the tube as an amplifier. Another method would be to connect one of the ends of the potentiometer to the negative lead of the "A" battery and the center arm to the grid leak. In this way the potentiometer would be acting as a pure variable resistance, the potential applied to the grid being

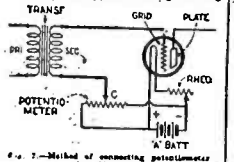


Fig. 2.—Method of connecting potentiometer in grid circuit.

always negative, but susceptible of variation within the limits of the resistance and the voltage of the "A" battery. (See *Grid Bias, Grid Battery*, also *Grid Control.*)

HINDER—Term occasionally applied to one of the various forms of atmospheric disturbance known under the general heading of *static*. This form of static is more prevalent in warm weather and does not appear to have its origin in local electric storms. Its effect is to produce rattling sounds of no definite pitch. (See *Strays*, also *Static.*)

GROUND—The earth considered as an electric conductor. In radio it is considered as the return circuit for electromagnetic waves. (See *Ground Connection*, also *Theory of Propagation of Electromagnetic Waves.*)

Guy Wire

GROUND CLAMP—A strip of metal, generally copper, having some sort of

A ground clamp for fastening the ground lead to a water or steam pipe.

arrangement for fastening rigidly to a water or steam pipe to form the ground connection for a radio receiver. The illustration shows a conventional form of clamp. (See *Ground Connection.*)

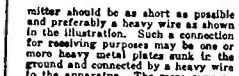
GROUND CONNECTION—In radio reception or transmission, the connection between the earth and the apparatus whereby the currents set up by the electromagnetic waves are returned to the earth as one side of the assumed circuit. The ground or earth connection from a radio receiver or transmitter should be as short as possible and preferably a heavy wire as shown in the illustration. Such a connection for receiving purposes may be one or more heavy metal plates sunk in the ground and connected by a heavy wire to the apparatus. The more common method is to connect the set to a convenient water or steam pipe, such pipes being almost invariably well grounded, especially the former. (See *Earth*, also *Ground* and *Transmission.*)

GROUND CURRENTS—Electric currents present in the ground due to the grounding of commercial electric machines. These currents very often prove a disturbing factor in radio reception. (See *Ground.*)

GROUND DETECTOR—A device for indicating an accidental ground on a power transmission line or for any conducting systems for electric currents. (See *Detector*, also *Ground.*)

GROUND RESISTANCE—See *Resistance of Ground Connection.*

GROUND SWITCH—A switch, generally of rugged construction, connected to



Switch having a break distance of not less than 6 inches.

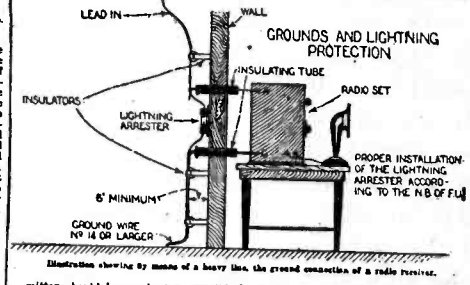


Illustration showing by means of a heavy line, the ground connection of a radio receiver.

the aerial, ground and apparatus in such manner that at one position the aerial is connected to the set, which in turn is connected to the ground, and in the other position the aerial being connected directly to the ground to protect the set from excessive static when not in use. (See *Lightning Switch*, also *Aerial Switch, Down Lead.*)

GROUND WIRE—The wire connecting a receiving or transmitting set to the earth. The underwriters specify not less than No. 14 B & S gauge copper wire. (See *Ground Connection.*)

GROUNDED ROTOR—See *Rotor, Grounded Connection.*

GROUP FREQUENCY—The number of separate trains or groups of waves per second in a damped or undamped system of radio transmission. This frequency is to be distinguished from the frequency of the individual waves. Thus in a spark transmitter, for example, the condenser in the transmitting circuit will be momentarily charged and discharged. The discharges will occur in the form of trains of oscillations, each oscillation having a certain definite frequency, but the trains or groups occurring at definite intervals, the frequency of these intervals being called the group frequency. (See *Frequency*, also *Spark Transmission* and *Undamped Waves.*)

GUARD LAMP—An incandescent lamp having a straight filament, sometimes shunted across the armature and field leads of a rotary converter used in radio transmission. Its purpose is to protect the windings from injury due to the inducing of oscillatory surges from the high-frequency circuits. (See *Rotary Converter.*)

GUTTA PERCHA—An insulating material derived from the milky secretion of certain trees, used as an insulation for submarine cables on account of its ability to resist the action of salt water. It is used to a lesser extent as a general insulating medium for wires, but owing to its scarcity and limited field of usefulness, rubber or rubber compounds are more widely used. (See *Insulating Materials.*)

GUY WIRE—Wires used to brace aerial masts for receiving or transmitting stations. Such guys are generally heavy galvanized wires attached to the mast at various points and extending radially downward and anchored to surrounding rigid objects or by means of some form of anchor in the ground. (See *Aerial.*)

The Electrified Aero-Seven

(*Continued from page* 107)

A zero to 200,000 ohms potentiometer is mounted in place of the rheostat (the right hand knob), where, connected between minus B and plus 90 volts, with the arm to the detector grid-leak, it provides a variable "D" bias for the detector tube. A plus bias of about six or seven volts is the optimum value here and is readily determined by varying the potentiometer control.

The filament switch is eliminated from the circuit.

All secondaries of the radio frequency transformers, and the grid returns from the first two resistance coupled stages are grounded.

Minus 1.5 volts is connected to ground and the plus side of the battery to the detector cathode (but not to any A.C. wire leading to the cathode). The cathode is the filament plus post.

These various connections are clearly indicated in the wiring diagram.

Five Arcturus type 28 tubes are plugged into the first, second, third, fifth and sixth sockets, a type 26 in the fourth or detector socket and a type 30 in the last or output socket.

Operation

The operation of the A.C. model is identical with that of the battery type, with the exception that fifteen volt transformer is substituted for the storage battery. A toy transformer is recommended for this purpose. The correct connections should be made and the variable tap set for fifteen volts.

In the event of necessity the A.C. model of the Aero-Seven can be operated, without loss of efficiency, as a battery set. Battery tubes and a storage battery are merely substituted for the A.C. tubes and transformer. No additional changes are necessary or recommended.

The Aero-Seven receiver can be completely electrified by the use of A.C. tubes, as described, in conjunction with a satisfactory "B" and "C" battery eliminator.

A highly satisfactory "B" and "C" battery eliminator for use with the Aero-Seven is shown in the photos and schematic diagram herewith. This eliminator will supply plate potentials of ninety volts for the r.f. tubes and 180 volts for the audio end, minus 1.5 volts for the amplifier grid returns and a variable high "C" potential for the power tube. The "D" bias voltage to the detector tube is taken care of in the receiver itself.

All terminal markings on the transformer are indicated in the accompanying schematic wiring diagram.

The eliminator is of course wired to the receiver in place of the usual "B" and "C" batteries. The minus "B" is connected in the conventional manner to the post provided for it on the set. This automatically takes care of the "C" plus connection.

The amplifier "C" potential is varied by adjusting the arm on the monostat until the receiver functions most satisfactorily—until the tone sounds most natural.

If a zero to twenty-five milliampere meter is available it should be included in the plate circuit of the power tube, while the "C" potential to this tube is being adjusted. The "C" voltage is varied until there is the least fluctuation of the needle on a loud signal.

All battery troubles are forever eliminated by the use of A.C. tubes and the eliminator described. Your receiver becomes as reliable as your power house, a consistency only comparable with its all around electrical efficiency.

Rejuvenating Old Tubes

A simple and efficient method of rejuvenating tubes which have gone dead has been revealed by the engineer of one of the large radio corporations, and is well worth the trial of any fan. It is even applicable to tubes which have, through long and faithful use, lost most of their pep. It is economical, because it does not call for any apparatus, outside of the regular receiver.

The method used, is to turn the filaments of all the tubes up to normal brilliancy, then reverse the polarity of the B battery, connecting the plus to the plus A battery, and the minus to the side which normally takes the plus B. Leave the tubes connected in this manner for a full hour, then turn the filament current down to its lowest point and leave current on for another half hour.

It will be found that an hour and a half of this treatment is sufficient in most cases to rejuvenate the tubes, but in cases where the tubes are unusually dead the treatment may be necessary for double that time. After treatment, the tubes should be allowed to cool off and then the batteries are connected in their regular manner.

Type 200-A tubes cannot be treated in this manner successfully, as once this type of tube has lost its sensitivity it is practically impossible to rejuvenate. The method will however bring back to normal sensitivity all 199, 201-A Hi-Mu and power tubes which have lost their pep. In testing this method, a set of tubes were used which were so dead that absolutely no signals were heard. After the process was completed, a matter of nearly three hours, the tubes worked as well as ever.

The Voltage of Your House-Lighting Line

By CHARLES GOLENPAUL

WHAT is the line-voltage of your house-lighting system? Why 110 volts, of course! But, is it really 110 volts? Have you tried an A.C. voltmeter on that electric supply of yours? If not, then you may be surprised to know that your so-called 110-volt current is anything but 110 volts.

The failure of some radio power units to deliver satisfactory results, particularly in the matters of volume and quality, either part time or full time, may often be traced to deficient line-voltage. Instead of 110 volts or better, the actual voltage available may be only 100 volts, or less. Especially is this true in rural districts, where the transmission lines are long and the voltage is not as carefully regulated as in the more populated sections.

Recently, in order to learn more about the input end of radio power units (and that is the real starting point of socket-power operation), the writer made a survey of various districts around New York. In the cities, he found the voltage usually better than 110 volts, and often as high as 120 and even 122; although during periods of heavy load, such as "dark spells" during the day or again in the early evening when the lights are turned on, the voltage dropped as low as 105. In suburban districts, especially northern Westchester County, the voltage during the day was found as low as 92 on some occasions, but generally hovering around 100, with an increase to 102 or 104 in the early evening, and up to 108 late at night as the lights are turned off in the many homes.

Now it goes without saying that such voltages are inadequate when operating transformers designed for 110 volts or better. The secondary voltage is very much reduced, because of the step-up ratio of 1 to 3 or 4 and even higher in the case of high-voltage radio power units. Many transformer manufacturers and radio power unit manufacturers fully appreciate the low voltage of most A.C. supplies, and are accordingly providing transformers which operate satisfactorily on lower voltages than the so-called 110. Others, aiming to take care of a variety of voltages that may be encountered, are providing their primaries with several taps, to compensate for lower voltages. Others, again going a step further, employ lower-voltage primaries with a variable resistor in the circuit, to reduce the current if necessary when the line-voltage runs high. A still greater refinement is presented in certain radio power units that are provided with a ballast tube

for automatically regulating the input current, irrespective of the voltage.

It will be noted that the usual glow-tube or regulator tube, while it does compensate for fluctuating line-voltage and fluctuating drain on the output end, by holding the 90-volt and the 45-volt taps steady, does not take care of the 135-volt and maximum-voltage taps which supply the amplifier tubes and the power tube. When "C" batteries are employed for the amplifier and power tubes, the wide fluctuation caused by line-voltage variation is sufficient to introduce marked distortion.

All of this means that the input current should be controlled to compensate for fluctuating line-voltage. The logical place for altering the radio power units to meet various voltage conditions is in the primary, or input end. This may be accomplished by means of a ballast tube, which does the work automatically in maintaining the performance at a fixed standard, or again by an adjustable resistor. The former method has its good points, notably in the automatic-regulation feature. However, there are times when the radio listener prefers to adjust the output voltages as a group for more or less power; in which event the variable-resistor method is preferable.

Many radio power unit manufacturers are now incorporating variable resistors in their products for line-voltage regulation. However, even in the existing radio power unit, without line-voltage regulation as a built-in feature, it is quite practicable to introduce this feature. All that is necessary is to place the variable resistor in one side of the input circuit; and this may be easily done by cutting the conductor cord and inserting the resistor in one lead. A 25-500-ohm power-type resistor is usually employed for this application. While it may be that the existing radio power unit is designed for 110 volts and not much less, still, there is a definite advantage in having a control for line-voltage; since it thus becomes possible to set the output-resistance values for a slightly lower voltage and then regulate the input when it is desired to strike the necessary balance.

In the case of the "A-B-C" radio power unit, the line-voltage regulator should consist of a 0-10 ohm power resistor, shunted by a 4 ohm fixed resistor of the heavy-duty type.

Until the not-distant future, when all radio power-unit manufacturers will probably incorporate a line-voltage-control device in their assemblies, the progressive radio set owner can improve his results and the stability of his outfit by means of a noiseless and reliable gradually-variable resistor in the input of his socket-power device.

Aerial Capacity and Wavelength

By S. P. O'ROURKE

IT is very interesting, when carrying out experiments with various sets and circuits, to know the capacity of your aerial to ground. There are various complicated formulas by which the capacity and inductance may be calculated fairly accurately; but these involve accurate measurements of the length and height of the aerial which are not very practicable for the average experimenter.

A much simpler method, and one which gives very accurate results, if conducted properly, is to tune in your local station, with the aerial and ground connected in the usual way and the aerial tuning condenser in parallel with the coil.

For instance, supposing WGY is tuned in at 30 degrees; now disconnect the aerial and again tune in the same station. It should appear now at about 120 degrees; in the phones, of course.

There is, therefore, a difference of 90 degrees between the two readings, which in the case of a .0005 mf. condenser, corresponds to .00025 mf. Thus .00025 mf. is the capacity of the aerial to ground. It is essential, of coure, to use an old-type variable condenser with semi-circular plates; as this is the only type which gives a straight-line-capacity reading from 0° to 180°.

Most experimenters, however, will have hidden away in the junk box one of these ancient variables, which may be connected up temporarily for the above calculations. It is a big point in short-wave work to keep the aerial capacity as low as possible, and the above method may serve as a measurement of any aerial-ground improvements that may be effected.

The usual method of determining the natural wavelength of the aerial system is by the well known formula: Wavelength equals 1885 times the square root of the microfarads multiplied by the microhenries.

Another method is described below which, in the writer's opinion, is very much more practical. It should appeal to the non-mathematical reader, since it involves no algebraical calculations or formulas.

Disconnect the aerial from the set and tune in your local station with the ground connected to its usual terminal. You should receive it at fairly good strength with an ordinarily efficient set. Take note of the aerial-tuning condenser's dial reading. Let us suppose in a particular case that this is 130°. Now connect the aerial lead and tune in any station you can, nearest to 130° on this dial. Supposing in the first instance WGY is received; now, when you have connected

up the aerial, WEAF tunes in at 130° or thereabouts. Subtracting WGY's official wavelength from that of WEAF, we have, 491.5 less 379.5= 112.0 meters. 112.0 meters then is the natural wavelength of the aerial in question.

Finally, a word about the receiving set. In order to find the wavelength accurately it is absolutely necessary to have a method of regeneration which, when varied, will produce no change in the wave to which the set is tuned; since less regeneration will be required when the aerial is disconnected. A receiver of the Hartley or Reinartz type is most suitable.

A Clean Radio Set Is Important

A radio set, like any other piece of fine mechanism, needs a little attention outside of the regular testing of batteries, tubes, antenna and ground.

The first thing that the serious broadcast listener should do is to dismantle his antenna system, wash the insulators in carbon tetrachloride or some other agent which will remove the heavy accumulation of dirt and dust. Then, examine the antenna itself. Is the lead-in joint tight and making good connection? Has natural oxidation made a poor connection? Wouldn't it be worth while to put up a new wire and attach a new lead-in? Wouldn't it be worth your while to change the direction so that some of those sought for Western stations would have a greater chance for impinging their infinitely tiny currents along the length of the antenna? While these matters, in many cases, seldom occur to the average radio set owner, they are nevertheless very important.

Then on the set itself. Take it out of the cabinet, and if a vacuum cleaner is handy, use the long hose attachment and carefully clean every last trace of dirt and dust from the set. Use a pipe cleaner folded double and clean the plates of the condensers thoroughly and see that the socket connections are bright and shiny and that the movable connections are all solid and will last. In other words thoroughly renovate or clean the set from antenna post to ground, cleaning all connections, brushing dust out of all the corners, cleaning off all surfaces where connections are made, testing all tubes, and in short giving the set a house cleaning. You will find out that much better results will be obtained from a set if it is given these periodical cleanings than if it is just dusted off from the outside with little or no attention paid to the inside.

Try This New Way-Buy Magazines at Wholesale

THIS is News! Big news for magazine readers of all classes! By special arrangement with a number of publications, we are able to offer you **wholesale** prices on the best of the standard magazines. Buy your magazines **now** under this great offer and you will save half or more than half the price at the single copy or newsstand rate. And you will save almost half in nearly every instance over the regular yearly subscription rates. Furthermore, we will send each magazine to a different address if you direct, or all to one, as you wish.

Never before have magazine clubs been offered in this way. Always heretofore all magazines in the club had to be sent to one person. We have changed all that! You can now have all the magazines sent to yourself, or only one or two to yourself and the other ones to different persons.

Show this offer to your friends, relatives or neighbors. Give them the advantage of wholesale price on their favorite magazine! For instance, you'd like "Radio News," one friend wants to renew his subscription for six months to "Review of Reviews," and another one would like "Illustrated Monthly." Separately the price would be $6.00; but you can buy them now for only $2.99! Less than half!

What would please friends and relatives more—What would remind them of your thoughtfulness so many times during the year, as a subscription to a nice magazine! What three presents could you buy for so little money that would look so big? A dollar or so apiece wouldn't buy much of a gift, but think what it buys here. If you can mark "Xmas" on the Coupon Order we will send the first copy of each magazine to reach the name given just before Christmas and will also send a beautifully engraved Christmas Card announcing it as your gift.

Before the name of each magazine is a number. Order by number only. If you want "Radio News," "Illustrated Monthly" and "Success" sent to you, order numbers 1, 2 and 29. If you want "French Humor" (26 issues) and "Illustrated Monthly" and "Success" order 5, 2 and 29. If you want these three sent to three addresses, indicate by number which magazine is to be sent to the respective name. Be sure to send order coupon **properly** filled out and don't fail to enclose remittance—your check will be acceptable.

You get the pair of magazines listed in each column heading plus any one magazine below. Order by reference number shown in brackets in front of each magazine.	(1) RADIO NEWS (2) Illustrated Monthly and any magazine below.		(3) AMAZING STORIES (2) Illustrated Monthly and any magazine below.		(4) SCIENCE & INVENTION (2) Illustrated Monthly and any magazine below.		(5) FRENCH HUMOR-6 mo. (2) Illustrated Monthly and any magazine below.

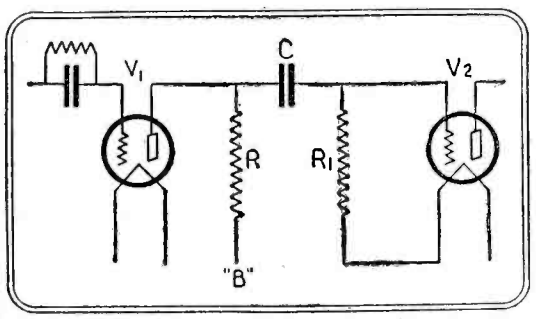
Eliminating the Detector Tap on the "B" Battery

By M. R. McCABE

IT has long been a mystery to the writer why radio designers and constructors continue to design and build radio sets employing a tapped "B" current supply with a reduced voltage for the detector tube. It is apparent that this practice puts an additional load on one section of the battery and causes it to run down more quickly than would be the case if the load were distributed over the whole battery. Possibly the first user of a multi-tube set used a tapped "B" battery, and the rest followed suit until it became a habit. Needless to say, this can be remedied in a very simple manner and expense reduced at the same time.

On the other hand, assume the use of a "B" socket-power device. The early forms of these devices were often troublesome, for want of a reliable device to control the detector-tube plate voltage. An adjustable resistor was employed for the purpose, and added to the difficulty of operation because the detector voltage had to be adjusted every time the filament control on the set was altered. The perfecting of more efficient power units remedied this condition, because of their flatter load-voltage characteristics; and the use of fixed resistors became practical.

Assuming a third case, where the set builder constructs his "B" power supply apparatus. By proper design



By the use of a suitable resistor in the detector plate lead, the drain on the battery is made uniform and its life thus prolonged.

of the set in the first place, the necessity for a detector-plate tap is done away; and this results in an appreciable saving in the cost of the equipment.

To obtain these advantages it is necessary only to employ resistance coupling between the detector and the first audio stage of the receiver.

It might be well, in passing, to mention that experiment with the value of the coupling resistor is advisable. It has been stated repeatedly that values in the neighborhood of 100,000 ohms function best; whereas the writer has on many occasions employed resistances as high a 3 megohms with superior results. The lower values did not seem to give as high amplification.

High resistance values, up to 10 megohms, will work in regular resistance-coupled circuits and save considerable on the "B" battery current. The blocking or coupling condenser between the plate and grid should be higher than usually employed; one-half microfarad is recommended in order to pass the lower audio-frequency tones. The grid leak on the first audio tube should be as high as possible without blocking or loading of the grid, which will be evidenced by distortion or periodical shutting-off of the music.

The volume resulting from this change is as great as if transformer coupling had been employed throughout the receiver. The reproduction is of course improved if there is any change; this depending upon the quality of the transformer that otherwise would be used.

Why "Kilocycles" Was Adopted

IN rearranging the licenses of stations lately, the Federal Radio Commission, like all technical men, has laid special emphasis on *kilocycles,* rather than on *wavelengths.* Yet the public has previously failed to respond to efforts to impose upon it this more scientific method of reckoning. There seems to be a popular feeling that a wavelength is something tangible, while a kilocycle is an abstract idea.

Yet the matter should be simple enough. A *cycle* is a reversal from positive to negative, and back again from negative to positive, in the electricity in an alternating-current circuit, or in the impulses creating the field of a radio wave. "Cycles," used as a measure of the rapidity of these changes, implies always *per second;* and "kilocycle" is simply a short expression for thousands of cycles (per second). A thousand kilocycles, therefore, means a million double changes per second in the *polarity* of the wave, as measured at any point in its progress; and, as the wave advances 300,000,000 meters (more accurately, 299,820,000, more or less) per second, the "peaks" will be highest at points 300 meters apart, along the path of a 1000-kc. wave. We have here the idea of a simple wave, corresponding to a wave in water, with approximately equal spaces between its highest crests. However, the water does not move steadily forward—it rises and falls—and the radio wave is *not a flow of current;* it is a *rise and fall* of voltage.

From the standpoint of classifying stations in a broadcast list, we might use either kilocycles or meters readily enough. We may also describe a distance as 66 feet, or as 1/80 of a mile, with equal accuracy; it is merely a question of convenience in reckoning.

But, in the technical problem of arranging stations so that they will not interfere with each other, it is necessary to calculate in cycles; because what is impressed on a radio carrier-wave is *not a wavelength. It is a frequency.*

A musical note is a vibration at the rate, for instance, of 300 cycles a second, causing air waves about four feet long. In an electric speech amplifier this would correspond to electric waves about six hundred miles long, because of the greater speed of electricity. But we do not add a six-hundred-mile wave to a thousand-foot wave; we impress a frequency of 300 cycles (per second) upon one of a million (per second). The result is a *"modulated wave."* The function of a radio detector is to iron out, so to speak, the million-per-second wave and leave the 300-per-second wave, which enters the loud speaker and reproduces a 300-cycle note, of sound in air.

Now, at the upper end of the broadcast band, a 300-cycle change affects the wavelength (measured in meters) about ten times as much as it does at the lower end of the band. At 5,200 meters, the wavelength used for transatlantic radiophone work, one kilocycle added to the frequency makes a difference of about 100 meters in the wavelength. At 5.2 meters, down near the very short wavelengths at which amateurs are now working, a kilocycle makes a difference of only about one ten-thousandth part of a meter in the wavelength.

Oscillation Control for R. F. Amplifiers

TO control oscillation in R. F. amplifiers, there have been suggested innumerable intricate methods, ranging from delicate balancing and neutralizing systems to the use of crude "lossers" in the forms of non-inductive resistors in the grid-return leads and the well-known potentiometer stabilizer. The use of variable plate voltage has also been suggested. A great number of these methods are either beyond the ability of the average radio layman to struggle with, or of such inefficiency as to be out of tune with engineering methods of today.

One of the simplest and most effective methods of controlling oscillation in R. F. circuits seems to be that of using, in series, across grid and plate of the R. F. tube, a midget variable condenser and a variable high resistor with a range from practically zero to several megohms if possible, and relatively fine adjustment.

An ideal arrangement comprises a .00025 mf. mica condenser, together with a universal range resistor, wired in series and connected to the grid and plate terminals of the tube socket. The resistor should be mounted alongside the tube, together with the mica condenser, to keep the R. F. wiring as short as possible. With several turns of the knob to cover a range of 200 to 5,000,000 ohms, this arrangement permits fine regulation of the R. F. stage.

The Filaments of your Vacuum Tubes

THREE types of substances are used as the source of electrons in present-day vacuum tubes. These are the oxides of certain metals, such as calcium, barium, strontium, etc.; the pure metals themselves, such as tungsten or molybdenum; and these pure metals mixed with a small amount of thoria (oxide of thorium) to produce the so-called thoriated or X-L filament.

The popular 201A, as well as the 199 type of tube, has a thoriated filament, with a tungsten base containing one or two per cent. of thoria. This thoria, at the proper operating temperature, slowly diffuses to the surface of the filament as thorium metal. The large emission of the thorium is thus secured at the high operating temperature of the tungsten filament. Some idea of the quantity of electrons given off from the hot filament is gained from the fact that 6,280,000,000,000,000 electrons per second escape from the surface when the emission current is one milliampere.

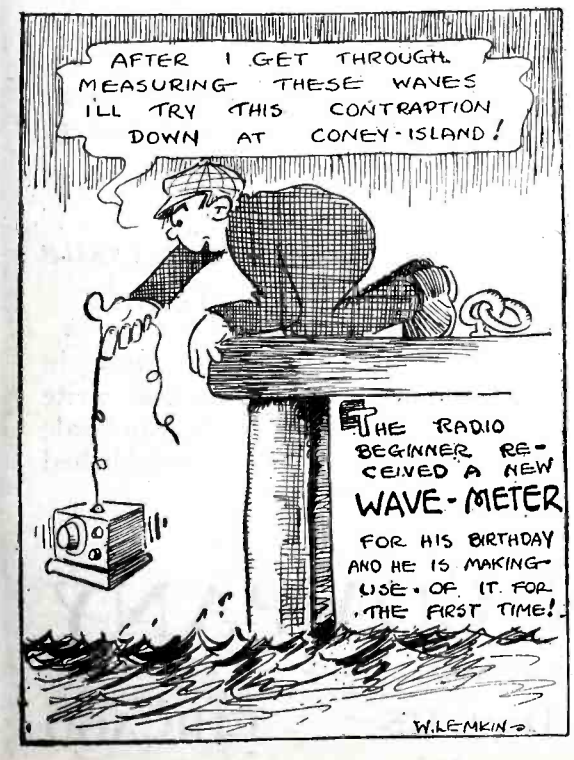
Duties of Condensers in Power-Supply Equipment

THE filter condensers used in "B" socket-power units should have sufficient dielectric to withstand the full voltage of the device over many years of service, and also to withstand the occasional peaks or surges which may run two or three times the maximum output voltage. It is wise practice, says Harry Houck, eminent radio engineer, to employ filter condensers rated at twice the output voltage; in other words, for a 200-volt maximum output "B" device, the filter condensers should be of 400-volt *working* voltage rating, and so on.

There are three filter condensers in the usual two-section filter system. The first condenser (that nearest the rectifier) does not have much influence on the hum or smoothing of the output current. It is intended rather to maintain the output at a fairly fixed voltage, despite the fluctuating current drain. It serves to regulate the rectifier.

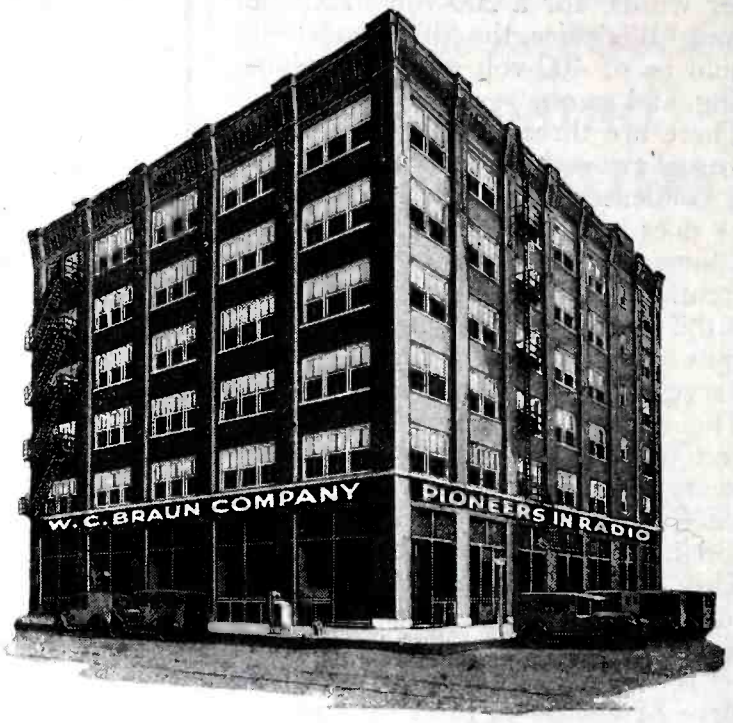
The second condenser controls the degree of hum, and any increase in the capacity of this condenser, within reasonable limits, reduces the hum in conjunction with the proper choke coils.

The third condenser controls the tone quality at full volume, because it acts as the virtual electrical flywheel of the "B" unit. It provides an ample reserve of energy to meet the unusual drains, particularly those caused by the deep, bass notes, placed on the "B" supply. This condenser should be as large as possible, say even up to 8 mf. capacity. The usual manufactured "B" socket-power unit can be materially improved by placing additional condensers, say 4 to 6 mf. in capacity, across the "B—" and highest "B+" terminals; thus building up the last condenser in the filter system for the best system for the best tone quality.



The Most Complete Lines, Quick, Intelligent Service and Fair Treatment

Have Now Made the Pioneer Distributors of Good Radio the Unquestioned Leaders!



Here the retail dealer may draw upon the largest, most complete stock of radio receivers, parts, accessories and supplies. In our book will be found the latest circuits, as specified in the various radio publications. Our force of experts renders aid in selling and advertising, and more than a hundred trained specialists assemble and dispatch your orders—12 Hours (or less) service on mail orders, 2-Hour Service on Telegraph, Telephone and Air Mail Orders. Inspectors, Dealer's Representatives—the most highly organized staff ever brought together to assure quick, intelligent service and fair treatment for our Dealers.

All of which effort has steadily surely forged from a modest beginning to unquestioned leadership in the distribution of good radio.

New Line of Monroe Radio Receivers Prove Instantly Popular

Last season our line of Monroe sets enjoyed a phenomenal popularity in every section of the country. Into their construction we placed the very finest materials obtainable, and only the most highly skilled workmanship. As a result, these sets became very popular with our dealers, because of the lack of servicing and the trouble-free service which they gave in the hands of the users. This year these old dealers will push these sets to the very limit, and although our appointments have been very widespread there are many good districts yet open for the Monroe franchise.

Largest Stock of Radio Goods in all the World—The Biggest Organization and Improved Service Facilities Help Braun Dealers Make the Best of the Biggest Year in Radio History.

Those who are in the best position to know feel that this will be the greatest year of activity in radio since its inception. With Broadcast conditions vastly improved and reception apparatus largely perfected, there is a new wave of public confidence and a renewed interest in the purchase of radio apparatus. Thousands of backward fans will equip their homes with radio this year. We have made vast preparations to back our Dealers up in this rush of business and we are daily doing it. Nowhere else may they find such wide selections and obtain such quick service. This places the Braun Dealer in a vantage point where he may easily overcome all competition.

Every Radio Dealer Should Have This New Issue of Radio's Confidential Wholesale Price Guide

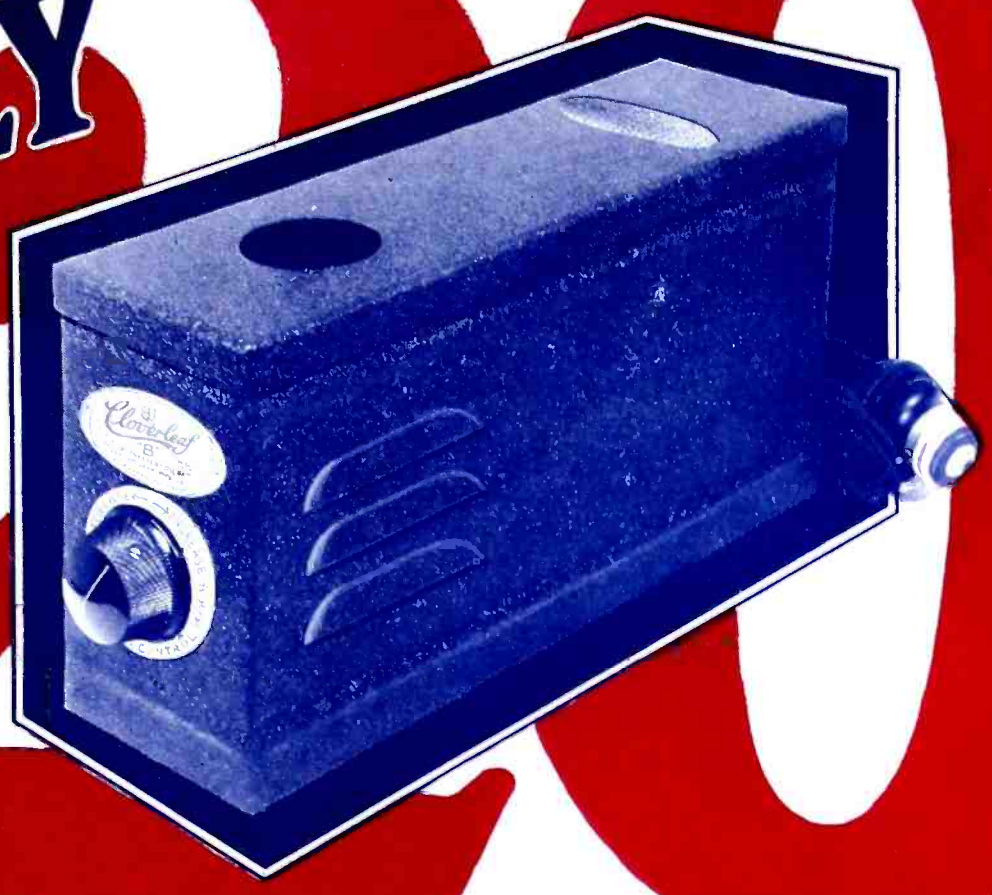
Thousands of Dealers everywhere use the Braun Book as their guide in selling and expanding their business. If you are not now on our list, write us on your letterhead. If not rated, kindly note names of three wholesale establishments from whom you now purchase. We want every established radio Dealer in the country and abroad to have this guide.

W. C. BRAUN COMPANY

Pioneers in Radio

563-573 Randolph Street Dept. 115 CHICAGO

ONLY $20



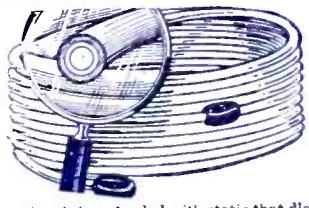
Here's a 180 volt "B" Eliminator at a Price You Don't Mind Paying

The NEW Cloverleaf Automatic "A" & "B" Control

A new and absolutely dependable automatic relay switch which localizes the control of the "B" Eliminator, trickle charger and "A" battery in the switch on the set. Easily attached in a few minutes. Only $2.75 from your dealer, or order direct, using coupon in lower right corner of this page.

Subantenna

Takes STATIC-FREE Radio Waves Out of the Ground



When the air is so loaded with static that distant reception is impossible with an "up-in-the-air" aerial, you can get loud, clear reception from your favorite far-away station, by picking it up out of the ground with a Subantenna. This amazing device is sold on an absolute guarantee of clearer, greater, better distant reception, or your money back. Send lower right coupon for explanation and particulars of Free Trial GUARANTEE OFFER.

Only $20—but it does everything that other 180 volt eliminators costing twice as much will do. In addition, it offers you positive assurance of a lifetime of dependable service. This new, advanced type unit will operate any set. 5-8-10 tubes, it makes no difference. Supplies constant voltages of 22-45-90-135 and 180 volts for a power tube, from fixed output taps. No adjustments—no exposed binding posts.

The Cloverleaf *Lifetime* "B" is, in all truth, the "B" Eliminator sensation of the season. Think of it! $20 now buys a real, *long lived*, high voltage, high current-output, heavy duty "B" backed by 2 year guarantee of satisfaction.

Obtain a Cloverleaf Lifetime "B" from your dealer—or, if your dealer cannot supply you, use the right hand coupon from this page to take advantage of the special introductory *free tube* offer we are now making.

CLOVERLEAF MANUFACTURING CO.
2712-M Canal Street - - - - CHICAGO, ILLINOIS

Genuine Q. R. S. 85 Mil.

Tube FREE

If you live in a town where we have no dealer, fill in and mail the coupon from the bottom of this column. We will send you the Cloverleaf *Lifetime* "B" Eliminator, express prepaid, and include a genuine $4.50 Q.R.S. 85 Milliampere tube *free*.

When the Cloverleaf "B" arrives, connect it to your set. Put it to every test you can think of. Make it drive a power tube. Then decide whether or not you think a better "B" eliminator can be built. If you are not satisfied, return the Cloverleaf "B" and we will immediately refund your money.

And if you do decide, despite the low price, that the Cloverleaf is the best "B" that any amount of money can buy—remember—it's backed by a two-year guarantee. Fill in and mail the coupon NOW.

Gorgeous Console Electric Radio

Here is the Metrodyne All Electric Console Radio — a gorgeous, genuine walnut cabinet, in a beautiful two-tone finish. Has a built-in genuine Metro-Cone large size speaker. Brings in programs with great volume, reproducing the entire range from the lowest to the highest notes with remarkable clearness and distinction. All metal parts are finished in old gold. Wonderful electric radio, in a cabinet that will beautify the appearance of any home.

100% Electric Radio

At last! The radio you've dreamed about! If you have electricity in your home you can now really enjoy coast to coast radio reception without the care, bother and muss of batteries, chargers, eliminators, etc. The **Metrodyne All Electric** is a real, genuine **batteryless** radio set. Simply insert the plug in the socket, press the switch button and "tune in." You could not possibly buy a better radio set than the **Metrodyne All Electric**, no matter what price you paid.

BEAUTY—EFFICIENCY DEPENDABILITY

The Metrodyne All Electric Radio is a 7 tube, single dial set. Only the highest quality low loss parts are used throughout. Solid walnut cabinet, beautiful two-tone effect, with handsome gilt metal trimmings. Size of cabinet, 28 inches long, 13 inches deep, 10 inches high. Has electrically lighted dial so that you can log stations in the dark. Only one dial to tune in all stations. Excellent tone qualities — wonderful volume — very selective.

Costs Less Than Most Battery Sets

Do not confuse the Metrodyne electric radio with ordinary light socket sets, because the Metrodyne is truly an **all electric radio** — consumes less than 2c worth of power a day. Comes to you **direct from the factory.** Its low cost brings it down to the price of an ordinary battery set. We are so confident that you will be delighted with this wonderful, easy-to-operate **batteryless radio** that we offer to ship it to your home for **thirty days' free trial** — you to be the judge.
